*Higher Education Mathematics Teacher Answer* - “*It can be harmful when trying a contest, such as in the engineering area, where he will not have any formulas available*”.

*Elementary School mathematics teacher response* – “*I don't see any negative points, as long as learning is well consolidated*”.

That is, the main points in the teachers' conception that the availability can harm are in the contests or entrance exams that the student will not have the formulas available at all times, and that the student may become dependent on the formulas as an "addiction" cited by a student. of teachers: *High School Math Teacher Response* - “*I believe the only negative point is the addiction that can occur. The student may become dependent on formulas to solve the test*”.
**Question V**: What is your opinion on the availability of mathematical formulas in the verification of learning?

*Elementary School Mathematics Teacher Answer* - “I think it is a valid practice, as it can contribute a lot to arouse student interest in the content, and in most questions what matters is not the formula itself, but its application and how to use it.”.

Justifying the use of formulas, the teacher says that it can help the student to become more interested in the mathematical content. However, it is observed that some who agree with the availability, however highlight some points that can be harmful such as:

*High School Mathematics Teacher Answer* - “I'm in favor, I don't see any problems, because the student who doesn't know the content, just the formulas in just doesn't help much”.

*High School Mathematics Teacher Answer* - “It is interesting, however, as it helps the students by “memorizing”, the student is also harmed, because, for example, “ENEM”, “contests” are not facilitators like that”.

*High School Mathematics Teacher Answer* - “The student will not be firm or confident when performing another assessment that requires memorization, but I see that the general perspective of the test has been changing, the contextualization, application and how that is approached in everyday life day is increasingly being charged. This idea of here is the equation and solve it has been outdated for a long time”.

*Higher Education Mathematics Teacher Response* – “The pandemic brought this new vision of evaluation, I believe that this plastered idea of decorating will become less and less usual, but, however, you should be careful and not generalize so much.”.

*High School Mathematics Teacher Answer* - “I like to make the formulas available to students, I feel that it brings more security for them to learn and not worry so much about memorizing, but I think that at the time of an entrance exam and/or contest it can harm them. it, as these selection processes often require decorating.”.

*High School Math Teacher Answer* - “I like the practice of making formulas available, but memorization also helps to stimulate students.”.

As can be seen, teachers realize that memorization has been less and less used, but there is a caution in this type of practice. Today, some selection processes, which are common in student life, address this type of requirement and are of great concern to teachers.

**5 FINAL CONSIDERATIONS**

Based on these statements, it can be concluded that teachers are inclined to support the availability of formulas during the evaluation practice. They are concerned with learning the method, problem-solving reasoning and learning the process, but they do not fail to highlight the points that harm this evaluative practice with selective processes that somehow require the memorization of content. It can be seen that the
pandemic moment that occurred from 2019 brought new experiences and visions to teachers, reflecting on the learning verification process.

However, as some teachers mentioned, memorization can also serve as a stimulus to studies and cannot be a discarded methodology. As Soistak (2014) says:

Memorization can contribute a lot to the modification of these negative concepts, because from the moment that the student masters the basics through memorization, he can come to understand and learn mathematics, performing activities with pleasure, in addition to his self-esteem being valued at this time. (SOISTA K 2014, P. 9)

Therefore, the way in which the verification of mathematical learning is approached must be analyzed according to each class. The analysis of the profile that the student has, the goals of the teacher and student can change the way to evaluate learning.

ABSTRACT  
Objective: The present study aims at the Mapping of Nursing Research Groups in the Management Area in Brazil arranged in the Directory of the National Council for Scientific and Technological Development (CNPq) as of 2017. In this sense, the research is committed to providing concrete data on distribution, year of creation, institutions to which they are linked, and quantification of scientific production on Nursing Management, identifying the most and least predominant themes. Methodology: This is a descriptive-analytical documentary study, with a quantitative approach through scientometric analysis. The research was carried out in 5 stages. The first step is related to data collection through the parameterized search, in the current base, as the search descriptor “Nursing Management”, the second step is the screening of groups in the management area with certified and updated status, the third step is the grouping and interpretation of the data obtained in an excel spreadsheet, the fourth was the survey of the research projects of the groups, and the fifth resided in the categorization of the projects into thematic axes: 1) Patient safety; 2) Workers' health; 3) Care management; 4) Competencies; 5) Quality Management; 6) Educational management; 7) Cost management; 8) Evaluation of health services; 9) Permanent Education; 10) Management in health services; 11) Organization of work; 12) Risk management; 13) Decision making; 14) Nurse's work process; 15) Staff dimensioning and 16) Resource management. Results and Discussion: We found 70 Research Groups registered in the CNPq Directory. Subsequently, the selection process began, and after excluding the groups in a situation of completion (4 groups), excluded (11 groups), not updated (13 groups) and those not framed in the theme (5 groups), the quantitative remained 38 research groups in the area of nursing management. As a limitation of the research, it was observed that many researchers do not keep their curricula on the Lattes platform with their data properly updated, and the instability of the collection. Conclusion: The research pointed to 38 research groups in the management line, which were located in public higher education institutions. Additionally, it showed a concentration of about 42.11% in the state of SP, with USP holding 23.68% of the number of research groups. Five new groups emerged during the pandemic period, thus revealing the need to encourage the implementation and permanence of these spaces within private universities, isolated colleges, technological education centers, and federal centers of technological education. During the document analysis, a total of 166 projects, in this way, Educational Management represents, 16.27%, the most predominant theme, and Resource Management, with 0.60%, the lowest percentage of productions. The results demonstrate the need for more studies to better understand the disposition of these Groups, incentives related to the exploration of less predominant contents, and factors that influence the permanence and activity of the Groups.  

KEYWORDS: Nursing; Professional Practice Management; Health Management; Research Groups; Organization And Administration.

1 INTRODUCTION  
With the advent of COVID-19, the spotlight turned to the professional nursing category, exposing their working conditions and relevance in facing the pandemic in the current scenario. The provision of
health care services by nursing is feasible and guided through management. The act of managing transcends the static, it is understood as a dynamic production, articulating practices such as analysis of the work process, research, cooperation, communication and active listening to the individuals involved (Santana et al., 2022; Sanchez et al., 2022; Sanchez et al., 2020; Silva et al., 2020).

Management actions in the sphere of nursing care are directly related to the quality of care provided, thus, where care takes place, management is present. As a result of the new demands that emerge from today's society, the construction of competent professionals begins in the nursing school and within this environment, the sharing of scientific knowledge is attributed to research groups. Therefore, the student's involvement in these spaces allows a reflective practice and generation of new knowledge, which aims to improve the quality of care and nursing practice. In this way, giving, in a material or immaterial way, not only to nursing, but also to society (Fachola et al., 2022).

Within this context, the research process is inherent to the implementation of new practices, improvement and updating of health professionals. In this way, ensuring more trained and qualified professionals, in addition to a positive impact on patient care (Ramos et al., 2022; Barreto et al., 2018).

Research groups in Brazil have lines of research, action based on norms and are included in the National Research Council, through registration in the Directory of Research Groups. They are formed by a team of professors/researchers, undergraduate students, graduate students (lato sensu and stricto sensu) and technicians from the higher education institution. It can be said that they are responsible for the production of scientific knowledge within the academic environment. Additionally, they are characterized as open spaces that facilitate the exchange of knowledge, exposition of ideas, creation of bonds, expansion of perspectives and interprofessional collaboration (Rossit et al., 2018; Silva et al., 2020).

Effective participation in research groups encourages critical thinking, reflection and the creation of technologies and innovations within the scientific scenario, through investigations, discussions and questions made within a given area, seeking to expose knowledge, revealing the results, relevance and material and/or immaterial products (Silva et al., 2020).

A research group can be defined as a collective activity that involves observation, experimentation, discussion and production in an area of knowledge, being a didactic environment conducive to group work. Because it is a place that provides an opportunity for discussion, promotes increased interaction between members and enhances the confrontation of their previous knowledge with other possibilities and explanations, as well as relates theory to practice (Moreira et al., 2018; Silva et al., 2020).

The Directory of Research Groups (DGP) in Brazil began its activities in 1992 at CNPq. The DGP can be characterized as a kind of inventory of scientific and technological research groups in productivity distributed throughout the national territory. In this way, the creation of a permanent research activity by a given institution is a prerequisite for its integration. Thus, the beginning of the stage of elaboration and design of activities aimed at research in an institution does not occur through the DGP (Coxe et al., 2019).

The information entered in the DGP is related to human resources issues that make up the groups
(academics, students, technicians and researchers), the production of knowledge (artistic, scientific and technological), the research segments in continuity, the spheres of application and partnerships between groups and institutions. Based on these data, it is possible to describe the general panorama of scientific-technological production in Brazil and its limitations. Furthermore, the DGP is composed of a current database in which data are systematically updated by the representatives of the groups. Additionally, it is worth mentioning that the censuses take place biannually, they work like a camera, recording in a photo the current base at that particular period and moment (Conselho Nacional de Pesquisa, 2022; Moreira et al., 2018).

The DGP has three main objectives: (1) To serve as a powerful information tool, thus, it can accurately report data on the members, location, finished and ongoing productions; (2) Its census character enables the construction of numerous reflections and research, revealing fields not reached, for example, qualitative assessment of the knowledge produced. Undeniably, this aspect makes it fundamental to the administration and management process; (3) Function as a kind of album, preserving all artistic, scientific and technological production in Brazil (Conselho Nacional de Pesquisa, 2022; Azevedo et al., 2019).

The National Research Council, in the organizational sphere, distributes the areas of knowledge in large areas, basic areas, sub-areas and specialties. On the other hand, in the DGP, the identification of research groups can occur by basic areas and large areas of knowledge (Coxe et al., 2019).

The present study aims to map the Nursing Research Groups in the area of Management in Brazil registered in the Directory of the National Council for Scientific and Technological Development (CNPq).

2 METHODOLOGY

This is a descriptive-analytical study, with a quantitative approach using scientometric analysis, this is the “quantitative analysis of science, based on secondary sources, without direct observation of the knowledge production process without direct evaluation of the results”. In this sense, it studies the emergence and expansion of scientific areas, the formation of human resources and compilations of scientific indicators, overlapping with bibliometrics, which develops patterns and mathematical models to examine the quantitative aspects of the production, dissemination and use of recorded knowledge. (Alvarado & Restrepo, 2018; Momesso & Noronha, 2017).

Scientometrics emerged in the extinct Union of Soviet Socialist Republics (USSR) and gained prominence in the world with the arrival of the Hungarian journal Scientometrics in 1977. It is identified as a science that studies scientific coefficients to give quantitative values to a survey, journal or even researcher ; it is the study of the quantitative aspects of science as a discipline or economic activity. It is a segment of the sociology of science, being applied in the development of scientific policies. In other words, the purpose of using it in research is to bring out more clearly and objectively the number of active research groups dedicated to nursing management. In this way, through reflections, propose research and stimulate the expansion of scientific production in the area of management. (Alvarado & Restrepo, 2018).
The quantification of Research Groups arranged in the Work Process Manage in Nursing took place through the Website of the Directory of Research Groups of the National Council for Scientific and Technological Development (CNPq), following the following steps:

**First step**

**Step 1:** Type “CNPq Research Group Directory” in the Google Chrome search box.

**2nd Step:** Click on “Research Group Directory - Lattes Platform - CNPq” as a result.

**3rd Step:** On the website of the Directory of Research Groups in Brazil of CNPq, on the Lattes platform, select the option “Search for Groups”.

**4th Step:** Keep selecting the Current Base and Current Census system.

**5th Step:** Type in the search term: Nursing Management and select the option “All words” in the box next to it.

**6th Step:** In the selection box below, search for: “Group”.

**7th Step:** Keep the markings proposed by the system in the part of “Apply the search in the groups” and “Status: Certified and Not updated”.

**Step 8:** Then click on “Search”.

**9th Step:** Through the parameterized query, with the following directions: current base, current census and, using the search term “Nursing Management”, 70 Research Groups were found registered on the platform Directory of Research Groups in Brazil of the National Council of Scientific and Technological Development (CNPq).

**10th Step:** After collecting the collected data, the groups were arranged in an excel spreadsheet to enable the mapping. The following figure presents the steps of the methodological path carried out to search for Research Groups in the Directory of Research Groups in Brazil:

---

**Figure 1:** Stages of research development, Niterói-RJ, 2022.

1. When accessing the Directory of Research Groups in Brazil website of CNPq, in the Lattes platform, go to Search Groups.
2. Select Parameterized Consult; Current Base; Current census
3. Search Term: Nursing Management
4. Total of 70 registers of Research Groups on Nursing Management
5. Selected: 38 certified and updated groups

Source: prepared by the authors (2022).
Second stage
1st Step: The mining process was carried out, after excluding the groups in a situation of filling (4 groups), excluded (11 groups), not updated (13 groups) and those not included in the current theme (5 groups), 38 remained. research groups in the area of nursing management.

third stage
1st Step: Grouping the data obtained in an excel spreadsheet.

fourth stage
1st Step: Survey of the research projects of the groups. Search carried out in the lattes of the leader and vice-leader of the research group.

fifth stage

3 RESULTS AND DISCUSSION

Research groups in the area of management provide essential tools for the construction and development of critical thinking in university students, based on the principle of cooperation and collectivity. Additionally, they return the health benefit to society as a final product of their research (Andrade et al., 2019).

Based on the above, it appears that the work of research groups is beyond the university's walls. Therefore, it is essential to guarantee the continuity of training and growth of health professionals (Mendes et al., 2021).

The data collected on the platform Directory of Research Groups in Brazil of the National Council for Scientific and Technological Development were grouped and organized into a single table, as illustrated below, for analysis and discussion purposes.

It appears that the number of 38 research groups in the management line are, for the most part, arranged in higher education institutions.
As shown in Figure 4, the University of São Paulo (USP) represents 23.68% of the total of 38, concentrating the highest percentage of research groups. In second position, we have the Universidade Federal Fluminense (UFF) with 10.53% and in third position the University of Brasília (UnB) and the State University of Londrina (UEL) with 7.89%. The need for reflection and research on the reasons that lead to the distancing of municipal universities and non-academic institutions, such as, for example, integrated faculties, schools, isolated faculties and academic centers. The analysis warns of the lack of expansion in these spaces.

According to figure 5, the state of São Paulo is the most privileged region in terms of the number of research groups, representing 42.11% of the total of 38 research groups. In second position, we have the state of Rio de Janeiro with 18.42% and the state of Paraná with 10.53%, occupying the third position.

The state of São Paulo, presumably, for having a large concentration of institutions and organizations, ends up showing a significant number of Research Groups when compared to other states. It is worth mentioning that the region also has the largest number of doctors and post-docs in the country, which explains the finding and takes them to the top as leaders of research groups (Coxe et al., 2019).
Regarding the year of creation, despite the pandemic context, a large concentration was identified in the period 2020, as shown in Figure 6. The oldest group was created in 1994 and this reveals a difficulty, whether in the context of financial development, human resources and even lack of time, in their continuity and permanence.

During the document analysis, as shown in Figure 7, a total of 166 productions was found, allocated according to the respective themes: (1) Patient safety; (2) Workers’ Health; (3) Care management; (4) Competencies; (5) Quality management; (6) Educational management; (7) Cost management; (8) Evaluation of health services; (9) Continuing Education; (10) Organization of work; (11) Risk management; (12) Decision making; (13) Nurse's work process; (14) Personnel sizing; (15) Resource management and (16) Management in health services. Thus, Educational Management represents, with 16.27%, the most predominant theme and Resource Management, with 0.60%, the lowest percentage of productions.

Source: The authors (2022).

The propositions reported imply the lack of studies aimed at the continuity of groups, expansion of the same in private, technological and scientific institutions and amplification of less predominant themes.
The findings brought in the figures, from the current census of the Directory, bring worrying results for the current reality. It is considered essential to fight for these spaces of academic insertion, expansion, preservation and valorization for a more critical and engaged education with the present. Focusing on the survey of research groups in the management line and understanding the projects that arise from these spaces is fundamental because it makes it possible to understand trends in the production of knowledge and research, in addition to identifying authors and academic partnerships.

Universities are highly capable spaces for scientific resourcefulness, fabrication of interventions and/or solutions aimed at problems identified in society and implementation of significant changes to the socioeconomic process. In this context, research groups function as a kind of entry and exit door for the somatization of knowledge (Souza et al., 2019).

The research group's essence is to engage its members through interest in the management line and involve them in theoretical references, in order to train them in the development of practical activities, thus reaching scientific maturity. In addition, it is worth mentioning that the vast majority of members end up building a welcoming space and affective relationships, which has a positive impact on the process of mitigating adversities in the research stages (Souza et al., 2020).

4 CONCLUSION

The research groups in the Nursing area, in the Nursing Management subarea, have lines of research and projects on different themes in the management area. The results demonstrate the need for more studies to better understand the disposition of these Groups, incentives related to the exploration of less predominant contents and factors that influence the permanence and activity of the Groups. Through the research carried out, it was possible to quantify and analyze the Research Groups on Nursing Management in Brazil. Regarding the contribution of the study, the collection of data for questions, reflections and collaborations for further research in this segment is elucidated.

The quantitative survey totaled 38 research groups in the management line, these, arranged in public higher education institutions. It pointed to a concentration of 42.11% in the state of SP, with USP holding 23.68%. Additionally, it identified the creation of five new groups during the pandemic context and revealed the need to stimulate the implementation of these spaces within private universities, isolated colleges, technological education centers and federal centers of technological education.

The involvement of university students in management research groups largely contributes to the formation of a professional with a reflective and science-based practice. Although a group contemplates a certain area of knowledge, this one goes through the resignification of knowledge, after all, each member carries and brings with him, in a unique way, his perspective and worldview. It is considered fundamental to fight for these places of academic insertion, for the expansion, for the preservation and valorization for a more critical and engaged education with the present. The group needs to keep in mind that it is not just occupying a space, but occupying in order to build and thus transform.
As a limitation of the study, there is the instability on the platform, sometimes outside the area. This ended up implying a longer data collection.

Bearing in mind the importance of mapping in this sense, as future works, it is expected to carry out the measurement and categorization of the management themes worked on in the groups, their respective projects and the most researched subjects. In addition, it is understood as essential to broaden the discussion by including more studies and adding the regional difficulties for carrying out research groups, calling due attention to the regions that do not have them.

ABSTRACT

This article deals with non-epileptic seizures in paroxysmal events of psychogenic origin. It discusses the difficulties that health professionals, responsible for diagnosis, have when dealing with individuals who present epileptic signs and symptoms, but which are not related to epilepsy. In this context, the general aim is to investigate how the process of diagnosis of non-epileptic Psychogenic Crisis (PNES) takes place. To this end, the methodological procedure reported the use of bibliographic research through data collection of published articles that cover and portray the theme directed to clinical practice, thus, academic publications were analyzed, selected those of interest, and through observation, the data were analyzed to gather the knowledge produced on the subject. After the research, it was concluded that health teams must know the characteristics, diagnosis, and treatment of a PNES so that when facing any apparent occurrence, the individual's life history is investigated in detail and the individual is referred to video-electroencephalography to correctly rule out or confirm the investigation and offer a resolutive treatment.

Keywords: Psychogenic, non-epileptic seizure; Epilepsy; Video-Electroencephalography; Traumatic events

1 INTRODUCTION

The Psychogenic Nonepileptic Seizure - PNES is determined by episodes of sudden or gradual alteration of behavior, movement, sensation, or consciousness, like the convulsion, non-fictitious that are presented through the motor, sensory and psychological expressions, which in turn are not caused by irregular epileptic discharges, but which are related to probable mental suffering. From this, the possibility of confusion in the diagnosis is common, since the lack of in-depth investigations by professionals and incomplete information about the patient, referring to their symptoms, hinder the diagnosis.

The NECP was named by neurologists of the contemporary age, soon after the insertion of the video-electroencephalogram (EEG) in epilepsies centers. From this milestone, around 1964, Liske and Forster originated the term pseudo-convulsions, which would also mean such events without alterations equal to that of epilepsy, which could be observed through the EEG (Liske & Forster, 1964; Goodwin & Gross, 1979). Consequently, different words have emerged, however, the most used in a scientific way are "psychogenic non-epileptic seizures", and "dissociation", which are seen as defense methods that help the user to deal with traumas, so the NECP also understands that traumatic situations generate mental dissociation.

Above all, tremors, movements of push-ups and extensions, absence of responses, fainting, and tonic posture, are reflexes of a PNES, with a remarkable change in the level of consciousness, however,
which does not portray abnormality in the EEG. There is also relativity and variations in the personality profiles of each individual with the crisis, which, in addition to the difficulties they face in dealing with their daily problems, have a greater tendency to suffer from anxiety, depression, disorders, and post-traumas.

Despite the possibility of confusion in the diagnoses, there are several ways to differentiate epilepsy from NECP, as it is also possible that the individual is diagnosed with both types of seizures, which makes it more challenging to reach a reliable conclusion about the case. However, the main causes that differ are based on the duration of the episodes and the outcome of the EEG, in which the appropriate treatment for PNES requires follow-up and therapy, thus avoiding the pharmacological indication, to contribute to the quality of life and to completely cease crises.

Therefore, the discovery of PNES is a challenge, since there are not many studies in this area about what is its precise diagnosis, to differentiate it from other epilepsies. In addition to similar symptoms that may lead some specialists to a reliable non-detection, such a crisis affects about 20% to 30% of patients seen in epilepsy centers, which demonstrates the importance of being investigated (Lanzillotti et al., 2021).

A misdiagnosis induces the administration of anticonvulsants in the in-hospital environment and the indication for daily household consumption, which can cause, consequently, the appearance of damage to the patient. Given that anticonvulsants do not treat PNES, because it requires treatment with attention focused on the mental state of the patient, to be able to face and deal with daily problems.

Thus, academic studies are necessary, because they generate data and highlight alerts for the possible consequences that trigger the PNES and the most common difficulties in diagnosing it. The differential in the correct diagnosis and treatment can generate a better quality of life for patients. However, they are information that helps in the search to train professionals who should guide the family and the patient properly about the subject, reassure and resolve the issue, to alleviate the apprehension and feeling of disability in the face of facts, signs, and symptoms.

This article is based on the following problem: What difficulties do the health professionals responsible for the diagnosis have when dealing with individuals who present epileptic signs and symptoms, but which in turn are not related to epilepsy? Based on this, this research has a general objective to investigate how the process of diagnosis of PNES takes place. In continuity, the specific objectives are to identify the characteristics of the PNES, to write how the diagnosis occurs, to highlight what differs from epilepsy, and to analyze the forms of treatments for patients with NET.

2 METHODOLOGY

The bibliographic research methodology was chosen for the development of this study, with data collection of published articles that covered and portrayed the theme directed to clinical practice, to analyze the publications of interest, select, observe, describe, and classify data to gather the knowledge produced
on the subject. The articles were selected with support in consultation with the databases of the *National Library of Medicine* (Medline/via PubMed).

Bibliographic or qualitative research is developed through studies and annotations resulting from existing research described in books, articles, magazines, theses, and others. The description becomes the basis of the themes that will be researched and, thus, the researcher performs the analysis and study through the collaboration of past authors. According to Minayo (2014):

> The qualitative method is what applies to the study of history, relationships, representations, beliefs, perceptions, and opinions, products of the interpretations that humans make about how they live, build their artifacts, and themselves, feel, and think. (Minayo, 2014, p. 57)

Therefore, bibliographic research aims to clarify the problem through references exposed in books, articles, dissertations, and theses, in which we seek to understand and verify the existing cooperations of the past and current on the subject. Thus, the methodology infiltrates as a scientific strategy, the analysis, which comes from separating the parts and emphasizing the most important ones. Analogous to this, Boccato (2006) exposes that:

Bibliographic research seeks to solve a problem (hypothesis) through published theoretical references, analyzing and discussing the various scientific contributions. This type of research will provide support for the knowledge about what was researched, how and under what approach and/or perspectives the subject presented in the scientific literature was treated. For this, it is of paramount importance that the researcher performs systematic planning of the research process, comprising from the thematic definition, through the logical construction of the work to the decision of its form of communication and dissemination. (Boccato, 2006, p. 266)

Thus, bibliographic research, brought subsidies for knowledge about THE PNES, outlined as the subject is presented in the scientific literature. Systematic planning of this research process was also carried out, comprising the definition of this theme, its logical construction, and, finally, the forms of communication and dissemination. This said, after data collection, they were systematized, establishing relevant and necessary relationships for the critical analysis and discussion of this relationship, based on theories concerning.

The article in question comes from bibliographic research and made use of a narrative review analyzing theoretical materials, starting from in-depth readings about non-epileptic Psychogenic crises. Through the studies, a holistic view of the subject was obtained, which culminated in this writing. It emphasizes that the analyses went beyond quick readings, there was a deepening in the interpretation of the writings studied for evaluation as a method of inclusion and exclusion, to support production, as shown in chart 1:
Table 1: Inclusion and Exclusion Methods.

<table>
<thead>
<tr>

Therefore, the records and the union of the most important information of the texts read, evaluated, and selected occurred, so that they could be supported by writing. Qualitative research, in which the readings performed, and the compiled data went through interpretation and reflexive and subjective inference of the researcher that culminated in the results described during the text, as well as in response to the research problem.

3 DEFINITION AND CHARACTERISTICS OF CRISE PSYCHOGENIC AND EPILEPTIC

There are two types of episodes of non-epileptic seizures, non-epileptic physiological convolution, and non-epileptic psychogenic seizure. When it comes to the physiological issue, it means the epileptic event itself is caused by a paroxysmal systemic dismemberment, such as hypoglycemia, migraine aura, intoxications, disorders, and transient ischemic attacks. However, the non-epileptic psychogenic convolution has no connection with brain activities but is caused due to some suffering or mental matter (Jr et al., 2013).

Therefore, PNES are called situations in which the individual has through the body manifestations that portray epileptic seizures, but which are not related to activity linked to epilepsy. Therefore, although any age may be affected by such a crisis, the index has a frequent focus on females aged 20 to 30 years (Jr et al., 2013).

It is possible to restrict the PNES to four prototypes in an etiological manner. The first is based on Freud's assumptions (Breuer & Freud, 1893-1895), having a statement that the PNES manifests itself physically due to emotional stress. The second prototype is conceived by Moore and Baker (1997), which analyzed that, the PNES is the result of learned behavior and operating conditioning, that is, the relationship between behavior and its consequence.

Consequently, the other two more up-to-date prototypes have returned to the dissociation mechanisms. Thus, Bowman (2006) reported that the PNES succeeds dissociative memories or assignments of the mind instituted by traumatic issues. According to Baslet (2011), PNES is due to an acute dissociative response to intimidation or a condition of high arousal, and even then, no prototype was found that portrays all but partially explains the crisis.

However, after THE PNES, there is a change in automatic responses that are seen as involuntary and unwanted but are motivated by the experiences of users who recall the seizures. That is, healthy
individuals can deal with negative emotions from day to day, while those who have a psychogenic crisis show abnormality in the face of emotional triggers and produce behavioral responses that portray seizure-like attacks.

**4 DIAGNOSIS OF PSYCHOGENIC NONEPILEPTIC SEIZURE**

In both medical and psychiatric investigations, there is reason to suspect PNES when the patient's life history involves psychological mechanisms. Therefore, for psychiatry, there are some ways to define the crisis, such as the DSM (*Diagnostic and Statistical Manual of Mental Disorders*) - IV and the ICD (International Code of Diseases) - 10/11, which characterize conversion and dissociative disorders and, the DSM - 5 that discusses functional neurological pathologies (Lanzillotti et al., 2021).

In fact, patients tend to have other symptoms, such as depression, anxiety, and especially trauma and posttraumatic stress disorder. Thus, the diagnosis of PNES is indispensable, since its non-identification can cause harm to the user through the high doses of anticonvulsant drugs administered in the act in which epilepsy is suspected. A priori, epilepsy, and PNES have several different signs and symptoms, as shown on the following table (Anzellotti et al., 2020):

<table>
<thead>

The discovery of PNES can arise through the association of data, such as individual history, EEG analyses, and home videos. For a given diagnosis, four statements are suggested, which can be considered possible, probable, clinically established, or documented (Anzellotti et al., 2020):
– **Possible PNES**: cases in which a witness or patient reports ictal events, and interictal EEG is normal. An abnormal interictal EEG may also be consistent with a diagnosis of possible PNES.

– **Probable PNES**: cases in which ictal events with a semiological indication of PNES are witnessed by a specialist physician or evaluated by video-EEG recording that also do not indicate ictal epileptiform activity. Situations in which observation of the onset of the ictal episode is missing or the evaluation is made by a physician who has no experience in ictal evaluations make the PNES "probable".

– **Clinically established PNES**: cases in which an epilepsy specialist witnesses episodes and semiotic and objective findings are compatible with PNES. This includes situations in which, for example, there is resistance to eye-opening, interaction with the patient during the episode is possible, as it maintains some level of consciousness and partial responsiveness, or the ictal episode ceases as the doctor convinces the patient to interrupt him. No epileptiform activity in interictal or ictal EEG can be found.

– **CPNE documented**: cases in which the diagnosis produced by an epilepsy specialist taking into account the typical semiology of PNES and no epileptiform activity related to EEG is found at any stage of the ictal event, or before and after it. (Anzellotti et al., 2020, p. 8)

Approximately 10% of individuals who have PNES also have epilepsy, which makes diagnosis difficult (Labiner et al., 2010). Therefore, what is sought in patients who have both diagnoses are psychiatric comorbidities that relate to epilepsy, the occurrence of a seizure, in which the PNES follows, and the appearance of symptoms in people who are recovering from epilepsy to draw the attention of the caregiver (Kutlubaev et al., 2018). Despite the difficult discovery and few studies on the double diagnosis, the same should be considered when individuals with epilepsy present unexpected types of seizures focused on characteristics and frequencies (Anzellotti et al., 2020).

Furthermore, for the proper diagnosis, it is ideal to use the expanded monitoring of the EEG (which provides the recording of the differential between the voltage between brain sites during a given time) at the time of the crisis. However, some seizures do not show irregularities in due course, during the monitoring of the EEG, or there may also be concealment of information by movements, which makes it difficult to distinguish between epilepsy and PNES (Davis, 2004).

When this occurs, it is necessary to have an analysis of data such as the history of the individual, narration of those who witnessed the fact, clinical investigations, and ictal EEG (during the crisis) and interictal (the period between convulsions) (Davis, 2004). One means that helps in the diagnosis of PNES is the home video, when recorded by a family member the occurrence of the crisis, since it makes possible the investigation and search for signs that differentiate it from epilepsy, and that characterize the non-epileptic crisis.
In summary, a reliable diagnosis is made when the patient's life history is adaptable to PNES, signs, and symptoms establish an association with PNES when evaluated and correlated with EEG and crises do not have rhythmic patterns in all phases (before, during, and after the event). A significant standard, which represents 85% of the right for the PNES, is the so-called "2 s", when at least two EEGs are performed to show normal results, in the company of two episodes of seizures every seven days and resistance to two antiepileptic drugs (Cuthill & Espie, 2005).

5 FORMS OF TREATMENT FOR PSYCHOGENIC NONEPILEPTIC SEIZURE SUFFERERS

In the scope of care and analysis aimed at THE PNES, due to the lack of research on appropriate decision-making, the referral of patients when received in basic and hospital care is performed to address specialists in epileptic seizures. Above all, treatment through drugs is not indicated, since the PNES does not respond to medication and does not cause direct sequelae, thus being treated through verbal and behavioral interferences.

Pharmacological treatment (antidepressants and anxiolytics) can occur when there are other complications and diagnoses besides PNES since individuals with such a crisis are susceptible to having other types of disorders, anxiety and/or depression, thus, there is the prescription of medications for better control of symptoms. In continuity, mental treatment turns to several types of therapies, such as cognitive, psychodynamic, interpersonal, hypnotherapy and family analysis, in addition to the need for monitoring and monitoring (Jungilligens et al., 2021). If left untreated, NECP can weaken the brain system and thus reestablish stress incitations, making them constant, which can result in a chronic clinical problem with difficult restoration (Kozlowska et al., 2018).

To Toffa et al. (2020), "Regardless of the level of certainty in the diagnosis of PNES, it is important to later refer the patient for epileptic and neuropsychiatric follow-up." In fact, referral to specialists facilitates discovery and more easily promotes the investigation of associated epilepsy to treatment as soon as possible.

After diagnosis, treatment can be divided into three parts. The first stage is focused on the communication of discovery. Empathic and positive dialogue can be performed with the patient in the presence of family members as a method for better understanding. The article "psychogenic nonepileptic seizures in children and adolescents: Part II – explanations to families, treatment and group outcomes", describes an example of the physician's approach to the family and a patient named Mary (Kozlowska et al., 2018):

You must be very relieved that Mary doesn't have epileptic seizures and that she doesn't have any unpleasant brain disease. Mary has non-epileptic seizures, which are caused by stress. There's been a lot of research on these types of seizures in the last 10 years. Now researchers have some very good hypotheses about what may be happening. It seems that the brain is very sensitive to the effects of stress. Now, when I say "stress," I mean any event that the body finds stressful – illness, injury, or emotional distress caused by stressful life events or trauma. Now, in Mary's case, it seems that [the stressors left in family history] have activated her stress system – including stress systems in
her brain. We know that your stress system is activated because your body is signaling this in several ways: [identify stress-related symptoms suffered by the child, such as pain, increased respiratory rate, increased heart rate]. Looks like Mary's stress system's been turned on, but it's not shutting down as it should. Nonepileptic seizures are just another type of stress symptom. Mary is also a girl, and she is post-pubertal. All of these stress-related disorders are more common in girls because female sex hormones also activate the stress system. (Kozlowska et al., 2018, p. 166)

In fact, the body's defense responses are anticipated by changes in arousal. Thus, NECP can be triggered by sudden elevation in cortical excitation, which leads to a functional suspension (dissociation) of brain areas that act together (Kozlowska et al., 2018). Based on this, the article "psychogenic nonepileptic seizures in children and adolescents: Part II – explanations to families, treatment and group outcomes" also highlights explanations if the family wants to understand the subject more accurately (Kozlowska et al., 2018):

The younger parts of the brain (the cortex) are very sensitive to stress and can be disrupted by stress and stress hormones (catecholamines and endogenous opioids). When brain function is disrupted, the parts of the brain that process excitation and emotions – emotion processing regions – become hyperactive, and seem to disrupt motor-sensory programs and cause all sorts of strange motor and sensory symptoms. In Mary's case, she has [describe all the motor and sensory functional symptoms suffered by the child]. Sometimes when there are sudden increases in arousal, the stressed brain is pushed to the limit of its ability. When this happens, the older parts of the brain (the brain stem), which are usually controlled by the cortex, can get out of control, in which case Mary may have a non-epileptic seizure. We know you've never heard of non-epileptic seizures before, but we see children and adolescents with non-epileptic seizures all the time. We saw some children who introduced themselves as Mary. There are many different names for these non-epileptic seizures, so I'm going to write them all down for you. Please be careful if you search for them on the Internet, because adults with this condition do not care very well while children do very well – so you do not want to read things on the Internet that do not apply to Mary. To treat Mary, we'll need to help her learn how to deal with stress and how to better regulate her body and brain's response to stress. This can be difficult at first, and even adults find it difficult to do. But we've had a lot of success with the kids, and we're also going to need to work with your family and Mary's school to try and manage the complicated problems you've raised. (Kozlowska et al., 2018, p. 166)

In sequence, the second part is linked to acute therapeutic intervention, such as psychiatric analyses, which should be considered that only 5% of patients do not have disorders and stressors (Witgert et al., 2005). Based on the treatment strategy, anticonvulsant drugs should also be discontinued unless the individual has had beneficial effects on use.

Therefore, the final part turns to the measures of long-term interventions, which include psychotherapy and drugs for other psychological comorbidities. Among psychotherapy and cognitive-behavioral therapy, the last mentioned has more efficacy (Mayor et al., 2010). In addition to these, psychodynamic therapy can also contribute significantly to the treatment of NECP.

6 CONCLUSION

In fact, it is evident that the convulsive crisis can be confused with the psychogenic crisis due to the similarities between them. Thus, despite the chance of an individual being affected by both, there may be the transfer of erroneous diagnosis and treatment, which can cause serious damage to the carrier, such as adverse effects of anticonvulsant drugs, continuity of events, and impaired quality of life.
Above all, health teams must know decision-making and times when they should suspect PNES. Thus, given any apparent occurrence, it is the professional's role to seek to investigate in detail the individual's life history and refer him to the performance of the EEG, to correctly discard or confirm the diagnosis and offer a resolutive treatment.

Depression, anxiety, trauma, and posttraumatic stress disorder can monitor or trigger PNES. Therefore, when the crisis occurs, family members must observe the duration and frequency, in addition to looking for mental comorbidities and situations of the suffering in the daily life of the patient, to help him to deal with such problems.

It is believed that when performing this research, it was possible to expose through this article relevant questions of analysis regarding the signs and symptoms, diagnosis, and treatment of NEPC. Therefore, the resolution of the problem happens when the crisis is identified and treated appropriately, thus, there may be the formation of a bond between patient and family members when reviewing possible traumas and improved attempts to overcome them, ease and knowledge in the decision-making of family members in the face of episodes, reduction of expenses, the better quality of life and engagement in the individual's social environment, and also, the possibility of discontinuity of epileptic episodes of psychogenic origin.

It is understood that the writing of this article may contribute to health professionals, patients, and family members, so that they can understand PNES, as an emotional disease that lacks in-depth analysis with the multidisciplinary team to be diagnosed. In the same way, it is necessary for follow-ups that meet the difficulties experienced by patients.

Bringing this theme to discussion through qualitative and bibliographic research provides knowledge about the PNES and demystifies erroneous understanding of the diagnosis. In addition to promoting other scientific productions on the subject, making this theme more discussed and contributing to the improvement of the lives of patients who have the PNES.

ABSTRACT
Objective: To describe the impact of the pandemic of COVID-19 on patients living with human immunodeficiency virus. Methods: This is a descriptive and exploratory research; the search for data was conducted through the Virtual Health Library (VHL), SCIELO (Scientific Electronic Library Online), and CAPES Periodicals. For the selection of articles, it was taken into consideration the application of inclusion criteria: publications between 2020 and 2022 and exclusion: publications before the year 2020. Results: According to the research carried out it was necessary to do a bibliographic survey on top of the keywords: human immunodeficiency virus, SARS-CoV-2, and CD4, where we saw that many of these articles were related to patients living with HIV/AIDS and that in the isolation period, the same ones for remained without doing some tests such as CD4 and leading, at the same time, the hospitalization of the same ones in the reference units for COVID-19. Final Considerations: However, it is not known if the infection by HIV/AIDS associated with low CD4 levels, when not controlled correctly, can lead to a greater risk for SARS-CoV-2, because it is a potent virus.

Keywords: Antigen, CD4; COVID-19; HIV.

1 INTRODUCTION
In December 2019, an unknown SARS-CoV-2 viral infection began in the city of Wuhan, located in China. This Severe Acute Respiratory Syndrome 2, where its main etiological agent is a virus that belongs to the Nidovirales family and the Coronaviridae lineage, having positive ribonucleic acid (RNA) as responsible. The infection caused by this was defined as COVID-19, which has reached more than 27 million people around the world so far, making it a challenging pandemic for the World Health Organization (WHO) and other public bodies of health. health (RODRIGUES; GALLI, 2022; DUARTE¹; QUITANA, 2020).

In Brazil, the scenario was devastating, especially in the face of governments that were oblivious to the situation experienced by all, where social vulnerability made it difficult for people
who experienced the greatest social inequality to have access to health care. Access to health at the moment is not limited to health equipment, but comprises the right established by the organic health law, the Federal Government, State and Municipalities have to guarantee education, food, basic sanitation, housing, among others, and safety. financial support that make it possible to maintain social isolation without government assistance (SILVA; CEIA; TAVARES, 2020; CHIORO et al., 2021).

In September 2020, the country accumulated more than 126,000 deaths from the new Coronavirus, after its contamination and symptoms were confirmed, medical intervention and care carried out immediately had a deadline for satisfactory results, but many of these patients could not go beyond 14 days of treatment. treatment and died. The symptoms were confused with those of a flu or virus, the protocols implemented in the countries took a long time to get off the ground, as it was common to arrive at the health units with fever, cough and fatigue, and diarrhea, dyspnea, hemoptysis, headache and lymphopenia could also occur (TEIXEIRA et al., 2020; SILVA et al., 2021).

After the control measures and protocols signed between the countries and their health regulatory agencies, such as the National Health Surveillance Agency (ANVISA) in partnership with the Ministry of Health and its secretariats in the Brazilian states, it was determined that patients with these symptoms had priority to be tested for COVID-19 and for many of these patients it was too late, as some had age and comorbidities against them even though they left their immune system defenseless (SANTOS, 2021).

Analyzing the relationship between immune response and severe acute respiratory syndrome virus 2 (SARS-CoV-2) infection, the disease that affects immunocompromised people, especially those living with the Human Immunodeficiency Virus (HIV) or the Immunodeficiency Syndrome (AIDS), we know that the HIV virus was discovered in 1983, despite this, the policies implemented still represent an important public health problem in Brazil (ALCOCHETE; CATUMBELA, 2020).

In 2020, there were about 37.7 million people living with HIV, among them 36 million are adults, 1.7 million are children (0 to 14 years old). When talking about gender, 53% of people living with HIV are women and girls, and those living with HIV 84% are aware of their clinical condition. Even so, we have those who did not know that they were living with or that they had HIV, about 6.1 million people. In the current scenario, the COVID-19 pandemic, social isolation had to be carried out, which made it difficult for this population at risk to access health services, thus hampering the diagnosis of new cases and the monitoring of seropositive individuals (UNIDAS, 2022).

Coronavirus pandemic, a more careful and targeted look at people living with HIV/AIDS should be taken, considering the clinical implications of COVID-19 that may have on the health of this immunologically vulnerable population. In addition, it is necessary to count the cluster of differentiation 4 or cluster of differentiation (CD4) which will measure the amount of lymphocytes present in the body. In Brazil, these tests are free, and the population had access to them, and the expected results can demonstrate
the stability of the infection are those in which CD4 cells are in large numbers (COSTA SOUZA et al., 2020).

Faced with the clinical picture of several of the patients affected by the HIV virus, and with this arrival of a new virus such as SARS-CoV-2 highly destructive with apparent symptoms of a common flu. This new virus has thrombolytic action in blood vessels and arteries, which lead to pulmonary and coronary complications. In this context, there was curiosity to know how patients living with HIV are dealing with the COVID-19 pandemic, and whether there have been sudden changes due to a new infection associated with the HIV virus. Since CD4 cells are highly immune cells, where they have the function of fighting the invaders that are active during their mutation by the acquired syndrome and at the same time the bone marrow has to redouble its production of defense cells.

The aim of this study is to describe the impact of the COVID-19 pandemic on patients living with the human immunodeficiency virus.

2 METHODS

This is a descriptive and exploratory research, in the form of integrative review. Data collection took place in a virtual way, with a search for articles in databases such as: Virtual Health Library (BVS), SCIELO (Scientific Electronic Library Online), CAPES Periodicals (Coordination for the Improvement of Higher Education Personnel) and university websites that contained published scientific works.

For the selection of articles, the application of inclusion criteria was taken into account: publications between 2020 and 2022, full-text articles, publications in Portuguese and English, free of charge and that met the objectives of the integrative review. Exclusion criteria: publications prior to 2020 and unpublished articles.

3 RESULTS & DISCUSSION

The results obtained since the initial search were 158 articles in the following bases: Virtual Health Library (VHL), Google Scholar, Scientific Electronic Library (SCIELO), which contained published scientific works. Referring to the years 2020 to 2022, where we apply inclusion and exclusion criteria through careful reading to carry out the selection of publications.
In Google Scholar, 67 articles were initially found, after applying the inclusion and exclusion criteria, 06 articles corresponding to the theme were used. In the VHL platform initially 15 articles were obtained, after applying the inclusion and exclusion criteria, only 04 articles corresponding to the theme were used. Initially, 76 articles were found on the SCIELO platform, after applying the inclusion and exclusion criteria, it was found that the articles with titles referring to the topic were repeated on the other platforms, therefore, we obtained 05 articles used.

Therefore, the selected articles totaled 11 articles, which will make up the discussion of the present study. As described in Table 1.

Tisiology and Society

Quanti - qualitative method of semantic network analysis

As a result, we identified the political-partisan polarization of comments about COVID-19 and HIV/AIDS on Twitter, the re-emergence of stigmas associated with specific groups, such as homosexuals and Asians, and the large-scale spread of misinformation about the two diseases, revealing a field of tensions and narrative and media disputes as a ‘necropolitics’ tool.

Our theoretical and empirical trajectory allowed us to arrive at some considerations. The posts by Brazilians about HIV/AIDS and COVID-19 in April 2021 indicate that discussing, in this case, public health in the Brazil is also talking about (necro)politics, stigma and excessive circulation of (mis)information on websites and social networks.

GONÇALVES et al., 2021. Analysis of the release of NETs by neutrophils from people living with HIV, and their effect on the replication of HIV-1 in macrophages

Field research.

High levels of DNA-elastase complexes in plasma were observed, which correlate positively with the concentration of circulating LPS, and that neutrophils from these individuals are able to release NETs in vitro upon activation with IL-8 and TNF-α. This suggests that HIV-1 infection enhances the formation and circulation of NETs and that microbial translocation may contribute to this phenomenon. It was also observed that NETs reduce viral replication in macrophages infected in vitro by HIV-1 and that recombinant myeloperoxidase is able to reproduce this inhibition. Furthermore, a reduction in the integration of the viral cDNA into the host cell genome

These results, therefore, indicate the participation of NETs in the pathophysiology of HIV-1 infection.

are, in general, guidelines from societies of specialties, expert opinions, in vitro studies, case reports and some case series (with a small sample size). Palpable and solid scientific basis so as not to cause harm to the patient.  

| STURZA; TONEL, 2020. | The challenges imposed by the COVID-19 pandemic: from measures to protect the right to health to impacts on mental health | Literature review. | It was found that isolation, the constant fear of illness and the threat of unemployment cause immeasurable damage to the mental health of the population. | The main contribution of this research lies in the possibility of reflecting and asking about the various issues relevant to the unfortunate spread of this new coronavirus, which has been leading to a rigorous health and humanitarian crisis, with damage to the right to health, individual and collective freedoms, and people's livelihoods. |

According to Alves et al. (2021), the pandemic brought with it a care network to work directly with infected people during social isolation. It is essential to work on the principle of integrality and interdisciplinarity with the expectation of satisfactory results for this population at risk. It is of paramount importance to have CD4 cell counts below the reference number (< 500 cells/mm³ of blood), that is, immunosuppressed clients, who have some advantages of SARS-CoV-2 infection.

For Barbosa (2022), the COVID-19 pandemic had a large participation of empirical actions and interventions and based on findings, often exclusively derived from in vitro tests, which showed the intense release of pro-inflammatory cytokines, responsible for the worsening of the clinical picture of patients with COVID-19.

Dias (2022), comments that the treatment was often out of control, and the search to treat with effective drugs was usually dubious, even so, the treatment is arduous and needs to follow the treatment protocols. The medical procedure of clinical decision, which is usually guided by a rational approach, based on evidence, becoming clearly emotional.

Falavigna et al. (2022), describes that the pharmacological treatment of hospitalized patients with COVID-19 and the HIV virus is highly complex because we are treating different pathologies that have in common attacking the CD4 of these immunosuppressed patients. The target population has indications for hospitalization in cases of diagnosis or suspicion of COVID-19. We know that the demand during the crisis was intense and led to the death of these patients who lived with the HIV virus.

Ferreira & Santos (2022); KREWER et al. (2022), reports that COVID-19 can have a cure through biosecurity measures, including all the necessary guidelines to combat the opportunistic
pathologies of HIV/AIDS. This can also lead to another situation that is not visible, which is depression, due to the few acceptable cultural and social advances to overcome social exclusion and the historical stigma of the disease.

Gonçalves et al. (2021), comments that the appreciation of the release of neutrophils from people living with HIV/AIDS, exists between, one or another, variation with symptoms and characteristics that do not fit among the diagnoses of pneumonia directly, however, it is a characterized form. diagnosis that is usually infected by Mycoplasma Pneumoniae, from which place, according to the symptoms, it presents pain in the lung base, reported by the client as back pain, and absence of secretion.

Rodrigues & Galli (2022) report that the respiratory system is the main organ affected, according to studies published in scientific databases, which identified the relationship of some pathologies such as influenza associated with clinical manifestations and in different body systems. human associated with SARS-CoV-2, such as: cardiovascular, digestive and central nervous system.

Napoleon et al. (2021), says that the invasion of pathogens, known as: viruses, bacteria and fungi, is fought by two major defenses of the immune system: an initial defense, conducted by innate immunity; and a later one, mediated by acquired immunity. However, this initial innate defense can prevent the entry of invaders into the body, using physical barriers such as: skin and mucous membranes of the respiratory and gastrointestinal tract and antimicrobial peptides, secreted by epithelial cells and by some leukocytes.

COVID-19 patients living with the HIV virus also have lymphopenia. Low baseline CD4 cell counts of generally African individuals will increase the acuity risk of COVID-19. Immune triggering in Africans is associated with environmental factors such as parasitic infections, other infections and vaccines. It is unclear whether the immunogenicity and efficacy of anti-SARS-CoV-2 vaccines will also be reduced by similar cell defense mechanisms (WOLDAY; NDUNGU; GÓMEZ-PÉREZ; WIT, 2021).

According to Pereira, Gir & Santos (2021), the control measures together with social distancing were the biggest move in history to mitigate the damage caused by the COVID-19 pandemic. However, Santos et al. (2022), comments that HIV needs regular monitoring and biannual monitoring of CD4 rates and viral load, seeking the necessary medications to continue treatment, in addition to dealing with opportunistic HIV diseases.

According to Silva et al. (2021), hospitalizations during the pandemic period brought with them the imminent fear of death, and even with all the correct care and treatments to maintain the survival of these clients living with HIV, it was not possible to keep everyone alive, as the disease is overwhelming, and brought with it terror in the country's intra-hospital units.

Sobreira & Marques (2020), corroborate Sturza & Tonel (2020), when they say that social isolation was necessary for the prevention and control of infection by the COVID-19 virus; still, they
wonder if “it was good for whom” many people believe that the quarantine constitutes an unwarranted decrease in personal freedom, while on the other hand the uncertainties of the labor market, where many have lost their jobs and their housing. The economic and financial impact in general was considered a major contributor to the increase in psychological disorders, evidencing the negative effects on the mental health of these individuals, even post-quarantine.

4 FINAL CONSIDERATIONS

Serum positive patients who have been contaminated by COVID-19 will suffer not only from physiological damage, but also from their emotional structure that has been totally shaken, such as seclusion, lack of care and loneliness. This scenario of a new infection challenged our seropositive patient to be more aware of their own health. However, these individuals had their lives interrupted due to numerous cases of SARS-CoV-2, where their families did not have the right to watch over that body.

COVID-19, without a shadow of a doubt, has brought insecurity and uncertainty for tomorrow, it has certainly been causing devastation in the world and we have to deal with the situations imposed by our rulers, where it suffocates, social inequalities and the overlap of the economy and of profit on human life. However, it is not known whether HIV/AIDS infection associated with low CD4 levels when not properly controlled can lead to a greater risk for SARS-CoV-2, as it is a potent virus, for this reason, it is necessary to have all hygiene care and have the habit of wearing masks even if released by the health authorities of our country.

ABSTRACT
Distance higher education in Brazil has been challenged to integrate this new educational process with a body of education professionals, including the face-to-face tutor and the distance tutor. This work discusses the distance tutor, the objective is to evaluate the knowledge of the online mediation of the distance tutor in higher education. The relevance of this study is related to the need to evaluate the tutor’s work during and after their performance and what needs to be improved. The distance tutor with the use of tools and artifacts performs the online mediation of the student’s learning through the virtual learning environment. It is asked, therefore, what knowledge does the distance tutor need to appropriate to carry out this educational work in distance higher education? In the cross-sectional and descriptive research, the data had a quantitative approach. Developed from the theoretical framework in relation to attitudinal, conceptual, and procedural knowledge (COLL,1998).

It was observed that the research in the final model provided by the multiple regression and comparing the standardized coefficients β, presented in the conceptual dimension greater weight in the composition of the grade of the evaluation scale (β = 0.529), it was understood that the conceptual knowledge is well represented in the assessment of students towards tutors. As for the attitudinal knowledge, it reached a level of (β = 0.319), signaling a median line between the knowledge, which is conceived that the degree of motivation is above average relative to the results of conceptual knowledge. Procedural knowledge was below average than conceptual knowledge, at a level of (β=0.233).

The results showed that this level reveals that although the tutor receives everything ready, the methodologies and didactic strategies must be more intensified, as they need to mediate with regard to adequate language, more intensified online social presence in the virtual learning environment, with activities of targeted learning and diagnostic, formative and continuous assessment activities that regulate student learning.

Keywords: Evaluation. knowledge. Online mediation.

1 INTRODUCTION

The technological revolution has caused changes in the way of learning and teaching, with the emergence of distance education courses in the various educational institutions of our country in higher education. This new way of learning and teaching was regulated in the distance education modality (DE) through the Education Guidelines and Bases Law - Law 9,394, of December 20, 1996, which advocates in its article 80, the use of this modality at all levels and modalities of education.

The cited article was regulated by Decrees 2494 of February 10, 1998 and Decree 2561 of April 27, 1998, both revoked by Decree 5622 of December 20, 2005, and this was revoked by Decree 9057 of May 25, 9057 in force that governs the quality assurance policy with the Ministry of Education, which recognizes (DE) as an educational modality, with legal apparatus in relation to management, planning, implementation,
accreditation, disaccreditation, operation, supervision, monitoring and offer and evaluation of courses the
distance in the national territory in all levels and modalities of education that follows the citation of its
article 11 § 2 “The accreditation of a higher education institution is allowed exclusively for the offer of
undergraduate and postgraduate courses sensu in the distance modality” and takes the opportunity to
mention Ordinance 275 of December 18, 2018, which provides for stricto sensu graduate programs in the
modalidade the distance.

Distance higher education is supported by the Quality References for Distance Higher Education
(RQESAD), regulated by the Distance Education Department in August 2007, which below transcribes the
topics of the quality references for distance higher education:

(i) Conception of education and curriculum in the teaching and learning process;
(ii) Communication Systems;
(iii) Teaching material;
(iv) Evaluation;
(v) Multidisciplinary team;
(vi) Support infrastructure;
(vii) Academic-Administrative Management;
(viii) Financial sustainability.

Item (V) Multidisciplinary Team that regulates the presence of education professionals working in this
modality is highlighted with the following content:

In distance education, there is a diversity of models, which results in different possibilities for the
composition of the human resources necessary for the structuring of courses in this modality. However,
whatever the option established, human resources must set up a multidisciplinary team
with the functions of planning, implementing and managing distance courses, where three
professional categories, which must be in constant qualification, are essential for a quality offer: teachers; tutors; technical-administrative staff. (RQESAD, 2007).

Distance higher education in Brazil has been challenged to integrate this new educational process
with a body of education professionals, including the face-to-face tutor and the distance tutor. In this work,
the distance tutor is discussed, the objective is to evaluate the knowledge of the distance tutor’s online
mediation. The relevance of this study is related to the need to evaluate the tutor's work at a distance, during
and after their performance in what needs to be improved. This assessment allows institutions to combine
efforts to monitor the performance and implementation of continuing education so that the distance tutor
can act effectively.

The distance tutor using digital tools and artifacts performs the online mediation of student learning
through the virtual learning environment. It is asked, therefore, what knowledge does the distance tutor
need to appropriate to carry out this educational work in distance higher education?
2 CONCEPTION OF KNOWLEDGE IN ONLINE MEDIATION

It is observed that to carry out this educational work, the tutor needs knowledge and it is verified that there is a need for the distance tutor to position himself through the pillars of knowing how to be, knowing how to know and knowing how to do. Finally, adopt the posture of being in the learning process. Belloni (2001, p.85), confirms that “To face this new situation, the teacher will have a very strong need for constant updating, both in their specific discipline and in relation to teaching methodologies and new technologies”. Several authors carry out this discussion of knowledge in which Farias et al (2008, p.73) are cited and contextualize that the

> Synthesis of existing categorizations of teaching knowledge: professional training knowledge, disciplinary knowledge, curriculum knowledge, experience knowledge; knowledge of Educational Sciences, knowledge of the pedagogical tradition, experiential knowledge, knowledge of pedagogical action, attitudinal knowledge, critical-contextual knowledge, specific knowledge, curricular didactic knowledge, knowledge of knowledge.

It is conceived that for this study it is considered that the performance of the distance tutor is constituted in the knowledge of the attitudinal, conceptual and procedural dimension based on the studies of Coll et al (1998).

Mediating learning in the virtual learning environment in the attitudinal dimension is a motivational action in which the distance tutor seeks to awaken in the student the desire to learn, to study, to attend the discipline, to continue in the course. This motivation contributes to the virtual solitude being disarticulated and the student can feel the sign of belonging and come to interact with the tutor at a distance, with the course colleagues with the tool, with the didactic material in the construction of the knowledge of the subject he is studying.

Coll et al (1998, p. 122) assures that attitudinal knowledge is “an enduring organization of motivational, emotional, perceptual and cognitive processes in relation to some aspect of the individual's world”. In this it can be observed that the attitudinal knowledge is integrated in a humanizing, educational and emancipating process that encompasses the motivation, emotion, perception and cognition of the student and the distance tutor. It becomes a two-way relationship in which the tutor learns and teaches.

But to work in distance education, conceptual knowledge is also highlighted in Coll et al. (1998, p.132) admits that “The more intertwined is the network of concepts that a person has about a given area, the greater will be his/her ability to establish meaningful relationships and, therefore, to understand the specific facts of that area”. Conceptual knowledge is constituted by the pedagogical foundations that involve the domain of pedagogical, didactic and technological concepts mediated via online that become essential for the monitoring, regulation and evaluation of the student's learning.

In the online mediation of the distance tutor, the procedural knowledge that Coll et al (1998, p.77), evokes that “the set of actions or decisions that make up the elaboration or participation is what we call procedure” is still present. Procedures are represented by “habits, techniques, skills, methods and routines”.
The procedural knowledge integrates the didactic knowledge, the curricular knowledge, the knowledge of the experience, the know-how that involves the methodologies and the strategies that guide the pedagogical practice via online.

Procedural knowledge consists of discovering how the student learns, as each one has their own learning style and, in this way, acquire strategies that reach the students in a collaborative way; procedural knowledge is concerned with planning which contents promote the construction of knowledge, sensitizes itself in the use of adequate tools and artifacts to carry out effective mediation so that the student in the virtual learning environment can learn and apprehend the contents for their academic formation and human formation.

3 METHODOLOGY

The study refers to an excerpt from the master's thesis, whose research was carried out at the Federal University of Ceará (UFC) in the academic unit, the Instituto Universidade Virtual, in undergraduate courses in the distance education modality, with data collected through a tutorial evaluation instrument in which students in the virtual learning environment through the SOLAR System, evaluated the knowledge of the distance tutor's performance.

Gonçalves (2003, p.14) comments that “research in terms of objectives is classified as exploratory, descriptive and explanatory research”. The research had a transversal and descriptive nature and the data had a quantitative approach, in which Silva and Silveira (2007, p.148-151), evoke that “the quantitative research aims to measure numerically or statistically the phenomena”.

The object population of the study consisted of students enrolled in the 2011.1 academic semester in undergraduate courses in the distance education modality at the Virtual University Institute of the Federal University of Ceará. The sample was constituted by the random selection of 07 (seven) courses among those offered by Instituto Universidade Virtual in the academic semester 2011.1; and involved 1957 students, 175 tutors, 26 disciplines, 7 undergraduate courses, in 27 centers located in the State of Ceará.

Data collection was carried out through a tutorial assessment instrument that consisted of a questionnaire with 16 closed-answer questions (multiple choices and items on a likert scale with items agree, disagree, partially agree) developed from the theoretical framework of the study in relation to attitudinal, conceptual and procedural knowledge (COLL et al,1998).

4 RESULTS

The data obtained from the research were submitted to a multivariate analysis that, through the measurement of the likert scale, one can evaluate the tutor's knowledge at a distance. hair et al (2005, p.32) mention that “the objective of multiple regression is to predict changes in the dependent variable in response to changes in the independent variables”. In this study, the tutor is constituted as a dependent variable and
knowledge as independent variables in which the result of the knowledge scores attributed by the students evaluated the degree of changes in which the distance tutor needs to make to act effectively.

SPSS 15.0 font

Observing Table 1, in the final model 3 provided by the regression and comparing the standardized coefficients $\beta$, it is verified that the conceptual dimension had greater weight in the composition of the evaluation scale grade ($\beta = 0.529$), it is understood conceptual knowledge is well represented in the students' assessment of the tutors. As for the attitudinal knowledge, it reached a level of ($\beta = 0.319$), reaching a median line between the knowledges, which is conceived that the degree of motivation is above average in relation to the results of conceptual knowledge.

Procedural knowledge was below the average that conceptual knowledge presented, at a level of ($\beta = 0.233$). This level reveals that didactic methodologies and strategies should be further intensified, because
although the distance tutor receives the ready-made didactic material and the virtual learning environment, he still needs to mediate with adequate language, targeted learning activities, a more intensified online social presence, in the virtual learning environment, either in the forums in the discussions of the themes studied, and in assessment activities that are diagnostic, formative and continuous and that regulate learning, so that mistakes, doubts, are worked on and reversed in new learning.

4.2 GENERAL CONSIDERATIONS

The study showed that the distance tutor needs to appropriate conceptual, attitudinal and procedural knowledge to carry out online mediation in blended education, thus answering the question.

The study showed that conceptual, attitudinal and procedural knowledge can be used as criteria for the evaluation of the distance tutor, since evaluating the distance tutor is a complex activity and the theme requires continuity in new research to accompany the development, the performance of the distance tutor through the knowledge built in their online pedagogical practice.

The theme instigated the deepening of a new look at contemporary education with regard to empowerment in educational relationships, aiming in this way that the means and ends are directly linked to the construct of this phenomenon that is Distance Education that appears in education as a transformation movement in the learning and teaching process and in the distance tutor training itself, both in academic and continuing education and in their pedagogical practice.

The knowledge investigated was presented in a different way in the research, and it is important to pay attention to the procedural knowledge that involves the distance tutor's know-how and that denotes the need for continuing education so that they can deepen their pedagogical practice in the virtual learning environment with strategies and effective methodologies.

ABSTRACT

Pain is a potential risk to public health, it is characterized by a multidimensional experience associated with physical and emotional aspects. Pain warns of danger and avoids organic damage, but when it is impossible to perform daily activities and impacts the patient's life quality, it is classified as pathological and requires medical interference. The following article aimed to describe, through a narrative literature review, aspects related to pain and its proper management. Pain is a broad complex that is classified according to location, type, intensity, and periodicity. The categories referring to pain are nociceptive, neuropathic, and psychogenic. In addition, pain syndromes are diverse and can affect any system of the body. Emphasizing that it is essential to categorize as much information as possible to properly conduct the treatment of these diseases.

Keywords: health education, pain, painful syndromes.

1 INTRODUCTION

Pain is an unpleasant sensory and emotional experience adjacent to any actual or potential tissue damage. Classified as subjective and personal, and associates sensitive and cultural factors that can be modified by sociocultural variables and psychic aspects of being and the environment (Azevedo, 2018). The painful sensation should not be synonymous with harm, but an alarm that something in the body is not right. Pain is an adaptive mechanism that enables that eventual disorders are avoided and identified before they result in sequelae and progress to chronicity. However, when the pain persists, it becomes unbearable and reaches a state of hampering daily activities must be properly investigated and treated more intensively (Camilo, 2020).
The following article aimed to describe, through a narrative literature review, the main aspects related to pain and its proper management.

2 METHODOLOGY

This is a qualitative narrative review study, appropriate to discuss the state of the art of a given subject. It consists of a comprehensive analysis of the literature, without establishing a rigorous and replicable methodology at the reproduction level of data and quantitative answers to specific questions, as explained by and (2014).

This methodology was chosen because it is fundamental for the acquisition and updating of the knowledge on a specific topic, highlighting new ideas, methods and subthemes regardless of the emphasis in the selected literature.

Because it is a bibliographic analysis on the theory of mind and the understanding about of this competence in the adult individual, articles indexed in the of data Brazilian Society for Pain Studies (SBED),9 Scientific Electronic Libraryr Online (SciELO), Capes Periodicals, Virtual Health Library (VHL), Literature Latin America in Health Sciences (LILACS), Medical Literature Online (MEDLINE), Education Resources Information Center (ERIC), Brazilian Society of Anesthesiology (SBA) and Brazilian Society of Neurology (SBN) during the month of July 2022, with the last 5 years as the reference period.

The indexing terms or descriptors were used: signs and symptoms, pain, pain clinics, alone or in combination, without delimiting a time interval.

The criterion used for the inclusion of publications was to have the expressions used in the searches in the title or keywords, or have it explicit in the abstract that the text relates to the association of theory of mind with aspects linked to the adult individual. the articles excluded did not meet the established inclusion criteria and/or had duplication, that is, publications retrieved in more than one of the databases. Dissertations and theses were also excluded.

After the target information had been retrieved, initially, the reading of titles and abstracts, with no exclusion of publications at this stage. Subsequently, the complete reading of the 31 texts was carried out. As axes of analysis, initially sought to classify the studies as to the particularities of sampling,

bringing together those whose samples approach concepts and physiological with development normative or neurotypical; and those whose samples are clinically affected, symptomatological and therapeutic picture. From there, the analysis of the theoretical foundation of the studies, as well as the observation of the general characteristics of the articles, such as year of publication and language, followed by their objectives. Finally, performed if the appreciation of the applied methodology, results obtained and discussion. Specifically, to analyze the scientific production identified, qualitative techniques were not used and/or specific quantitative data processing, with the analysis of each one of the texts.
3 RESULTS AND DISCUSSION

The search for the articles that composed this study identified 255 references about stratification and adequate pain management in the aforementioned databases, of which 31 publications were included in the review. Among the selected studies, 28 articles present theoretical approach, 3 are case studies. There was a prevalence of publications in the English language, representing 84% of the total, when compared to the languages Spanish (9.6%) and Portuguese (6.4%).

During the present study, numerous review articles were found who discussed aspects related to stratification and adequate pain management. This fact possibly reflects the importance that this topic has for clinical medicine and the prognosis of the patient, which group the existing research related to the topic, a since these publications are very numerous, it allows for greater dissemination of information for the community and health professionals.

4 PAIN PHYSIOLOGY

A stimulus is detected from the sequence of four processes: transduction, transmission, modulation and perception. Transduction takes place at peripheral endings of primary afferent neurons, where different forms of energy (mechanical, thermal or chemical) are transformed into electrical action. The transmission is based on the direction of the electrical stimulation by the nervous system. Modulation is the phenomenon to which neural action can be modified along the transmission, and occurs preferentially in the column back of the medulla. Then perception takes place in supraspinal structures related in somatosensory chaining (Ferrari, 2021).

5 COMPONENTS OF PAIN

The phenomenon of pain encompasses four compounds which are nociception, pain, suffering and typical behaviors. Nociceptors are sensory nerves, which contain specialized free nerve endings. They are located in the skin, muscle, joints, viscera and dura mater, in addition to the fascia and adventitia of blood vessels (Azevedo, 2018).

Initially, tissue injury is detected by transducers associated with the A delta and C fibers that send signals to the dorsal horn, a process called nociception. This is usually triggered by sufficient mechanical, thermal or chemical forces, to cause some damage (Azevedo, 2018).

The reaction to nociception is pain. It is produced in the spinal cord and in the brain by nociceptive afferents. Neuronal bodies synthesize neuropeptides, substance P and CGRP (Calcitonin Related Peptide Gene), these induce vasodilation, plasma extravasation, macrophage recruitment, mast cell degranulation or other events that trigger inflammation neurogenic (Matias, 2022).

The conscious perception of pain takes place in the reticular formation of the brainstem, thalamus and other parts of the brain. Emphasizing the essential role of the cortex in interpretation of the painful quality. The primary somatosensory cortex points to location and level, while the secondary is associated with the
recognition of stimuli pain and thermal pain, experience related to pain and aggregation between tactile and nociceptivos (Cardinot, 2020).

Suffering in the face of pain leads to typical painful behaviors that are grimaces, groans, changes in gait, indisposition and the search continues for medical assistance.

This behavior is the result of environmental antecedents and implications. That is, these are important, but the investigation of the base factor should be prioritized (Azevedo, 2018).

The modulation process is descending connections between brain centers upper limbs and the spinal cord, which can amplify or inhibit the impulse of signals painful. This event justifies why pain is characterized as something subjective and individual. Emphasizing that triggers such as attention, sociocultural beliefs, state cognitive and emotional can determine how each person describes their own pain condition (Cardinot, 2020).

6 TYPES OF PAIN

Clinical concepts that help define the quality and character of pain are acute or chronic; diffuse or localized; pulsatile or continuous; deaf or colicky; in burning, tingling, stabbing, searing; sharp or painful; constant or intermittent; emergent or incident (Matias, 2022).

The acute pain is the result of an organic deterioration, of short duration, of nociceptive transducers at the site of injury. The local lesion modifies the way in which the regional nociceptors react to this phenomenon, which are processed in the horn dorsal and transmit painful information when the upward projection systems arrive in the brain. Usually, it is common after surgery and trauma, being necessary wound care, such as immobilization, skin sutures, and analgesic promotion until the restoration of nociceptive functionality (Azevedo, 2018).

Transient pain is generated by nociceptive activation, in the absence of tissue damage. It is commonplace and does not require intervention, exemplified with a prick of a needle, with importance focused on therapeutic regimens (Cruz, 2021).

Chronic cancer pain is associated with continuous tissue damage, justified by the pathological process and its therapy. The influence of these factors is relevant, but these do not comprise the exclusive and predominant causes of pain sensation in the patient oncology (Silva, 2021).

Chronic pain from non-oncological factors is attributed to injuries or pathologies previously existing, which many times have already been cleared, but the pain remains etiologies other than the pathophysiological mechanisms that caused the injury. This one that occurred is possibly a rearrangement of the spinal and brain, after original peripheral traumatic events, the anomaly may have a direct effect in the nervous system followed by disorder in the normal pathways or also by means of compensation that maintains the pain (Cardinot, 2020).
Diffuse type pain indicates a central process or an inflammatory process. THE Localized pain is adjacent to a delimited lesion, peripheral nerve injury, or an immediate postoperative situation (Silva, 2021).

The pulsatile type is a high indicator of bone pathology such as bone metastases, muscle strain and soft tissue injury. The deaf and colicky expressions refer to painful situations involving the viscera, such as irritation, inflammation and intestinal syndromes. Reports of burning, tingling, stabbing or stabbing are consistent with nerve damage or pathological changes correlated with the nerves (Carvalho, 2022).

The concepts constant or intermittent refer to a temporal period of pain. Constant indicates continuity of existence, responds satisfactorily to medications at time intervals throughout 24 hours. In contrast, the flashing is not so predictable and drugs are applied as needed (Vieira, 2021).

Emerging pain is based on a picture of pain exacerbation that exceeds abruptly the analgesia regulated by targeted therapy. requires intervention immediate relief from this. The incident type follows specific acts such as coughing, walking and weight lifting, therapy is prior to performing such activities (Carvalho, 2022).

7 CLASSIFICATION

Pain is a complex that is classified according to the pathophysiological mechanism, being typified as nociceptive pain syndromes, inflammation and neuropathy. At other pain syndromes comprise this triad or are characterized in terms of of pain due to a comprehensive diagnosis, such as cancer-related pain (Vieira, 2021).

Nociceptive pain requires ascending stimuli propagated by normal nerves, in the course of sensory neurons, and which ascend through the spinothalamic pathways of the spinal cord spinal. It covers somatic and visceral pain (Cruz, 2021).

Somatic pain is localized to the skin surface or intensely in the skeletal muscle. Visceral pain is poorly localized and usually related to organs deeper, such as the intestines (Rodrigues, 2022).

Inflammatory pain is due to the activation of acute inflammatory mediators and chronic, through tissue injury, trigger the painful process (Carvalho, 2022).

Neuropathic pain appears in an abnormal region in neural perspective, being result of damage to the central or peripheral nervous system. The pathophysiology is nonspecific, but the main ones are incisional injury, compression of neural tissue and dietary, chemical, ischemic, metabolic, neoplasm or paraneoplastic (Rodrigues, 2022).

The main sensory alterations in patients with neuropathic pain are alldynia, dysesthesia, hypoalgesia, hyperalgesia, hypoesthesia (Carvalho, 2022).

The sensation is identified as an electrical particularity or associated with paresthesia or abusive temperature changes. The involved portion has a change in sensitivity which is covered by pain. Therefore,
simple and light stimuli such as touch, pressure and temperature are amplified so as to generate intense pain or numbness. The pain neuropathic pain is exemplified by postherpetic neuralgia, phantom limb pain, thoracic post-thoractomy ea typical diabetic neuropathy (Kanematsu, 2022).

8 PAIN ASSESSMENT

The most relevant data to be investigated regarding pain are onset and duration; localization; severity or intensity, which must be stratified by some object or measurement; quality or character, worsening and improving factors, and reactions to any previous treatment (Kanematsu, 2022). It is essential to distinguish localized or diffuse pain, verifying that it occurs irradiation of this. Localized pain has a cutaneous, mucosal and nervous system origin. In contrast, diffuse pain derives from deep somatic or visceral structures. You types of pain are: localized pain, which does not cost with irradiation; projected pain follows the nerve pathway, which may completely involve the segment, as in herpes zoster, or just on the periphery; referred pain stems from a somatic structure that causes pain in another region of the same nerve segment, seen in back pain resulting from the abscess subphrenic; psychogenic is not categories in the neuroanatomical perspective, and has underlying factor an emotional disorder (Carvalho, 2022).

The physical examination investigates the existence of semiological aspects that are consistent with the pathophysiological mechanism of the underlying pain. The signs are possibly altered by acute pain, or regular in patients with persistent pain. To analyze the painful region includes a search for anatomical distortions, color changes, or skin consistency, spasms or muscle fasciculations. Palpation starts from light mode, advancing in intensity, to analyze the situation more accurately and to ascertain painful reproducibility (Kanematsu, 2022).

The triggering or aggravating factors cause the pain to increase, which the Eating acidic and spicy foods intensifies the pain of gastritis and peptic ulcer. You improvement factors are occasions that generate pain relief, such as postures that protect the structure in which the pain originates, or by the use of medications (Meireles, 2021).

Nociceptive somatic pain is precipitated by palpation of a region established. Pain that increases with action may indicate an injury or irregularity bones. Situation exemplified by abdominal discomfort, correlated with nausea, and the beginning of the inflammatory process results in pain intensification, through the palpation (Carvalho, 2022).

Nociceptive visceral pain has the classic sudden-onset retrosternal pain that radiates to the mandible, a result of myocardial ischemia, which touch does not interfere with in the characteristics of pain (Matias, 2022).

Inflammatory pain is driven by deep inspiration; the increase by Sudden abdominal decompression predicts inflammation. The existence of intensification pain together with lung sounds or irregular friction is consistent with pleuritic inflammation. Already the association of pain and reddened, swollen joints instill arthropathy inflammation (Silva, 2021).
Neuropathic pain courses with alldynia, characterized by painless stimuli if become highly unbearable; hyperalgesia, in which mild factors have high reactivity; causalgia, based on abrupt alliterations of temperature and color of the skin, when equated with surrounding regions; atrophy and alopecia of the regions involved; muscle fatigue correlated with pain; paresthesia by provocation of sensitized areas (Matias, 2022).

9 PAIN SYNDROMES

Cancer pain can be a result of the disease itself or of aggressive therapy.

Emphasizing that other diseases, such as arthritis or migraine, which is sharpened in the during the diagnosis and treatment of the primary neoplastic event (Tavares, 2021).

It does not have a single and isolated pathophysiological environment; this simultaneously can be acute, chronic nociceptive, inflammatory and neuropathic pain. still highlighting more the emergency in relieving this exuberant picture of pain, as it interferes significantly on the patient’s quality of life and healing (Lima, 2020).

Functional pain has no recognized organic substrate, being correlated to persistent pain. The main symptoms are irritable bowel syndrome, tension-type headache and migraine and myofascial pain syndromes (Lima, 2020).

Complex Regional Pain Syndrome (CRPS) is chronic, possibly of neuropathic character, with disautonomous signs. It is characterized by the feeling of burning, intermittent paroxysms and addresses two categories. SDRC type 1 courses with ongoing pain, alldynia, or hyperalgesia in which the pain is not trigger-matched, edematous, along with variations in blood flow and abnormalities of the motor functionality in the affected area. Type 2 CRPS is based on pain, alldynia hi hyperalgesia. In the aftermath, it is not restricted to the area of the injured nerve (Silva, 2021).

Phantom pain is a common chronic painful event after amputation of member. Even if the limb is not present, it causes pain, which can be severe and debilitating. It usually involves neuropathic pain and central sensitization from the peripheral nerve (Cruz, 2021).

Bone pain has the particularities of being deaf, painful and constant. It is located in pathological area, with delimitation in the irradiation. The aggravating factors are flexion, extension or even percussion (Carvalho, 2022).

Plexopathies are syndromes associated with a defined peripheral nervous plexus. from an anatomical perspective. Neural disorders address multiple nerves in the plexus. THE brachial plexopathy, pain is magnified by deep breathing or neck mobility and shoulder. Intense shoulder palpation may reflect pain or suggest a distension internal. Brachial plexopathy causes pain due to neoplastic infiltration of nerves, adhesions and compressions after infection, surgery or radiotherapy (Camilo, 2020).
10 ANALGESIA

Refers to the absence of painful sensitivity to stimuli, which is free from pathological conditions would not cause pain and without suppression of the other modalities sensitivity or loss of consciousness. The main forms of sensitivity are tactile, thermal, painful, vibratory, compression, stereognosis and proprioception (Rodrigues, 2022).

Anesthesia is a procedure to reversibly block all types of sensitivity. The purpose is based on allowing patients to go through processes invasive surgical procedures without pain. There are two categories of pain which are the site, which blocks the production and conduction of the electrical impulse in excitable tissues,

being able to locally abolish motor action and sensitivity; the general is a technique that generates complete hypnosis, anesthesia, analgesia and relaxation (Vasconcelos, 2018).

11 PAIN THERAPEUTIC

According to the World Health Organization, pain management follows some general principles that include intake, dose intervals, individualization of therapeutic regimen analgesic ladder, use of adjuvants and attention to detail (Carvalho, 2022).

Administration by oral route is chosen to apply analgesics. You are have the purpose of depriving the patient of the discomfort of more invasive means such as injections, pronoun autonomy and control of the situation. Regular time intervals should be established, as the fixed schedule allows the next dose to be offered before the effect of the former has ceased (Carvalho, 2022).

The selection of analgesic treatment should be in accordance with the history patient clinic. Which urges a different dose to regulate pain and alleviate effects collaterals (Rodrigues, 2022).

The analgesic ladder was created by the WHO to promote assistance in the treatment in proportion to the intensity of pain felt by it. From a ladder with three steps, which are based on weak pain and non-steroidal analgesics are administered. opioids (non-steroidal anti-inflammatory drugs and other analgesics). The intermediary is find weak opioids that can be combined with non-opioid analgesics or anti-inflammatory. At the top are strong opioids, which may or may not be associated non-opioid analgesics or anti-inflammatory drugs (Vorpagel, 2022).

Adjuvant drugs have side analgesic effects. These does not hold instant relief, some have their effects after weeks of use (Kanematsu, 2022).

Non-steroidal analgesics have a triad of particularities that address analgesia, antiphlogistic and antipyretic. Ibuprofen is indicated in processes rheumatic, trauma of the musculoskeletal system, especially when they have the typical features of inflammation. In addition, for the relief of post-surgical pain. O diclofenac is reserved for the treatment of degenerative presentations and rheumatic inflammation. Situations exemplified by rheumatoid arthritis, spondylitis chylous, osteoarthritis, spinal pain syndromes,
infections and inflammation. The other drugs in this class are ketoprofen, dipyrone sodium, paracetamol (Vieira, 2021).

The most commonly used weak opioid analgesics are tramadol and codeine. O Tramadol acts on the central nervous system, which is useful to treat severe pain intensity. There is association with other anti-inflammatory analgesics (Olivencia, 2020).

Strong opioid analgesics are morphine and nalbuphine. both are prescribed for the relief of severe pain and in Acute Myocardial Infarction (AMI) (Carvalho, 2022).

12 CONCLUSION

Given the existing information in the scientific literature on stratification and pain management can be clarified to be a broad topic, which all subtopics addressed help in understanding the painful involvement. does not come,

It is noteworthy that even with the advancement of medicine, there is a diagnostic deficit of pain, consequently remaining without proper treatment. Then, it is necessary to carrying out more in-depth research and studies that contemplate ways of arrive at a more targeted clinical hypothesis, fulfilling the purpose of depriving the patient from any pain and discomfort. .

1 INTRODUCTION

According to the World Health Organization (WHO), Down Syndrome (DS) or trisomy 21 (T21) is not a disease, but a genetic alteration that happens in the cell division of the egg, which results in an extra pair on chromosome 21, called trisomy (Brazil, 2019).
As a genetically determined human condition, it is the most common chromosomal alteration in humans and the main cause of intellectual disability in the population. The presence of the extra chromosome 21 in the genetic constitution determines specific physical characteristics and developmental delay. It is known that people with trisomy 21, when attended and properly stimulated, they have the potential for a healthy life and full social inclusion (Brasil, 2013).

In this context, Down Syndrome is characterized as the first known cause of intellectual disability, representing approximately 25% of all people with the syndrome. It is estimated that in Brazil it occurs 1 in every 700 births, which totals around 270 thousand people with T21 in the world, in addition, the incidence is 1 in a thousand births alive (Brazil, 2019).

In this sense, at a historical level, it is understood that the first reports about DS date from the mid-20th century.

XIX, however, it is believed that this cellular alteration, manifested in the human phenotype, was always present. Furthermore, studies of the Olmec culture, in the period from 1500 BC to 300 AD, show the representation of children and adults who differed from the others of their tribe and who had a similar description with people under the condition of SD (Pietricoski & Justina, 2020).

In addition, simple or standard trisomy 21 is understood to be caused by chromosomal nondisjunction, usually of meiotic origin, respecting about 95% of DS cases. Occasionally occurring, this type of change genetics is characterized by the presence of an extra chromosome 21, in a tricopy configuration, with the following description of karyotype = 47, XX+ 21 female and 47, XY + 21 male (Coelho, 2016).

Thus, DS by chromosomal translocation (or Robertsonian translocation) usually occurs due to chromosomal rearrangements with gain of genetic material, respecting between 3 to 4% of the cases, which may be casual or be inherited from one of the parents. In this case, the karyotype identifies trisomy 21 not as a free chromosome, but translocated with another chromosome, often involving chromosome 21 and chromosome 14. Thus, the karyotype description corresponds to the following configuration: 46, XX, t (14; 21) (14q21q) in sex female and at 46, XY, t (14; 21) (14q 21q) in males (Coelho, 2016).

Furthermore, the third type of genetic alteration associated with DS corresponds to mosaicism, the cause of more sporadic incidence of DS among the three types, respecting between 1 and 2% of cases. Its occurrence is casual and the zygote begins to divide normally, producing the distribution error of the chromosomes in the 2nd or 3rd cell divisions. O Mosaicism in DS is therefore characterized by the presence of two cell lines, one normal with 46 chromosomes and another trisomy with 47 chromosomes, with chromosome 21 being extra free (Coelho, 2016).

The clinical diagnosis of DS is based on the recognition of physical features. The more features
specific features of DS are identified, it increases the safety of the clinical diagnosis. The laboratory
diagnosis of DS is made through genetic analysis called karyotype, is the representation of the set of
chromosomes present in the cell nucleus of an individual, taking into account some classifications of
trisomy 21 (Pietricoski & Justina, 2020).
Thus, the present study aims to relate the classifications of trisomy 21 according to the amount of live births
in Brazilian states in the time frame from 2016 to 2020.

2 METHODOLOGY
This research is configured as a retrospective, descriptive study of live births with T21 that occurred
between 2016 to 2020 in Brazil. The pertinent information for the elaboration of this study was taken
directly from the Information System on Live Births (SINASC) via the Department of Informatics of the
Unified Health System (DATASUS) of the Ministry of Health (MS).
Retrospective studies have the ability to establish the possible factors that precede or characterize an
illness or ailment. This type of research can also ensure that measures of likely causal factors have not been
influenced by the knowledge of which individuals had the pathology of interest, characterizing the
impartiality of the research (Freire & Pattussi, 2018).
Also in this sense, in carrying out descriptive studies, the researcher plays the mere role of merely spectator,
without developing any intervention that could interfere with the natural course and/or the outcome of the
study. At observational research can be conducted in the form of four types of study, depending on the
design. Are they: case series, cross-sectional study, cohort study and case-control study, with the study
(Freire & Pattussi, 2018).
Furthermore, it is essential to show that descriptive research occurs when the researcher records and
describes the facts observed without interference from the samples found. This study typology seeks to
describe the characteristics of particular population or phenomenon or also the establishment of
relationships between variables (Prodanov & Freitas, 2013).
The study region corresponds to Brazil, consisting of 11 states by T21 mosaicism (Table 1), 19 states
by T21 meiotic (Table 2), 21 states by T21 translocation (Table 3). According to the ICD-10
classification, the
live births whose underlying cause was one of the following ICD-10 codes: Q900- Trisomy 21-n-
meiotic disjunction, Q901-Trisomy 21 mosaicism (mitotic non-disjunction), Q902- Trisomy 21,
translocation.
Through investigations carried out in May 2022, which were obtained through bank information
of SINASC data available on the DATASUS website, it was possible to calculate the percentage of the
causes above described for the period from 2016 to 2020.
The variables used with the DATASUS/MS pertaining to the sociodemographic properties were the following: year of birth, federation unit and classification. After extracting the data, they were organized using the Microsoft Excel® 2010 tool, in order to facilitate the calculation of the percentage of the established categories, and the results represented by tables for better observation and understanding of readers.

3 RESULTS AND DISCUSSION

According to the data collected from the states, the percentage of live births can be obtained, being developed tables and graph, according to classification and states, in the last 5 years (2016 to 2020).

In Brazilian states, there were 97 cases of T21 due to mosaicism, in the 5-year interval (2016-2020) according to DATASUS, with São Paulo (46.40%), Rio Grande do Sul (15.46%) and Espírito Santo (12.37%) with the highest percentage and the state of Rio de Janeiro (1.03%) Mato Grosso (1.03%) with a lower percentage, it can be seen that this number does not follow a constancy according to the years, as shown in table 1.

Furthermore, approximately 95.00% of children have simple trisomy 21, in which there are 47 chromosomes with an extra chromosome 21 present, in 1.00 to 2.00% of people with the SD phenotype, there are 2 lines cells, one typical and the other with trisomy 21, a condition called mosaicism (Moriyama, 2022).

In addition, as described by Moriyama (2022), the classification of DS by mosaicism in comparisons with the others is much smaller, as it was noticed when analyzing the following 3 tables according to the years and states the index of live births in the last 5 years with a total of 97 births.

Table 1: Percentage of live births with T21, mosaicism (mitotic n-isjunction) according to Brazilian states, 2016 to 2020.

It was found that in the state of São Paulo (60.82%), Acre (8.98%) and Minas Gerais (5.30%), presented higher T21 indexes by meiotic n-disjunction, while Alagoas (0.40%) and Mato Grosso do Sul.

Source: Data SUS.
(0.40%) present a lower percentage. It was also noticed that in recent years there has been an increasing incidence of cases, however, in 2019 a decline was obtained, according to table 2 below.

Despite this, although the meiotic T21 in 2018 showed an increase of 21.22% in births, in 2019 there was a relapse to 17.55%, but in 2020 there is a big difference of 26.53% with 65 cases in the Brazilian states, with São Paulo being the state with the highest number of cases compared to the others (Table 2).

Source: DataSUS.

In this lens, according to Candace et al. (2014), in most autosomal trisomies, trisomy 21 is more often the result of errors in the oocysts (referring to maternal errors) and accounts for 90% of cases among these meiotic maternal errors. It is worth mentioning that maternal age was identified as the potentiating risk factor for T21. IT IS

It is important to point out that Down syndrome does not occur only due to disjunction errors, even though, in most cases, in some cases, the extra chromosome is derived from this incorrect division. In Table 2 it is possible to observe a higher rate of births living through the states that have the highest prevalence, different from Table 1. That said, in the context of T21 by translocation in Brazil, São Paulo (30.80%), Minas Gerais (19.09%), Espírito Santo (6.58) have higher percentages of cases, contrary to Piauí (0.50%) and Alagoas (0.50%), which have a lower percentage, as shown in Table 3.
In addition, the so-called Robertsonian translocations, which occur in 3 to 4% of DS cases, may be incidental or inherited from one of the parents. Chromosome 21 trisomy, in this case, is identified in the karyotype not as a free chromosome, but translated to another, more frequent chromosome, the translocation involving the chromosome 21 and 14 (Brazil, 2013).

Unlike the other results, it was possible to observe that the number of live births by translocation was a total of 198 people in the last 5 years, considering that it is not as frequent compared to meiotic classification, but also it does not have a low index like mosaicism.

In T21, the translocation in Brazil, showed an oscillation from the year 2016 to 2018, it grew 13.13% already in the year 2018 to 2020 there is a 7.07% reduction in births, with São Paulo being the state with the highest prevalence of 30.80% of live births in the last 5 years (Table 3).

In addition, according to graph 01 below, the classifications were in order, n- meiotic disjunction with greater percentage, while mosaicism and translocation suffer some variations according to the years. And in line with the saying above, meiotic n-disjunction classifications have a higher percentage in live births in the last 5 years, manifesting an increase in births with Down Syndrome in 2020.

4 CONCLUSION

From the discussion exposed in this study, it is understood that the three classifications of Down Syndrome were created to systematize the terms of health, illness and functionality, as well as to allow their differentiation according to their respective genetic manifestations. Due to the data mentioned and exposed, it is observed that, in relation to the T21 classifications, meiotic nondisjunction was the most represented among the occurrences in the years that make up this clipping temporal.

It is added that, as evidenced in the literature, the classification of DS by mosaicism represented the lowest occurrences between demonstrations. Notwithstanding this, at the geographic level, it was noticed that in the three classifications, the state of São Paulo became highlighted by the large percentage evidenced, this finding is associated with its quantitative grid populational.

In this sense, this research made it possible to analyze the three classifications of trisomy 21, explaining, quantitatively, the percentage distributions of SD at the national level, evaluating the information provided in the DATASUS system, combining them with the current literature. This study nurtures a horizon for further research on this topic, providing new insights of the SD, as well as facilitating the process of including these people in society, through the understanding of their existence, especially in the states with the highest population rate.

Finally, the need to collect primary data for new studies is highlighted, since, knowing that the information that supported this research, as they come from existing database systems, depend on the quality and veracity of filling out the notification forms.
Thus, it is suggested the production of more studies aimed at deepening these materials, as well as a synthesis of studies of current elements about DS is suggested, especially after the pandemic period experienced, to understand the new live birth rates and their national distributions.

CHAPTER 81
The marketing challenges faced by the medical entrepreneur

1 INTRODUCTION

Undertaking in the health sector is one of the great challenges for professionals in this area. In a time of intense technological innovations, it is necessary to create new ideas and improve existing ones, in addition to innovating by creating products and services that promote the well-being and quality of life of clients/patients, even more so when it is related to entrepreneurial doctors (Bandeira, 2019).

In order to understand what entrepreneurship is, it should be noted that its emergence took place at the beginning of the industrialization, due to the First Industrial Revolution that took place in the 17th century in Great Britain. At that time, there were providers of capital, known as capitalists, and over time and with changes in the economic system, Entrepreneurs began to distinguish themselves among suppliers (Coutinho, 2019).
In general, entrepreneurship is the process of forming a new business, or even the remodeling of a existing enterprise, and it serves to cause positive impacts on the lives of individuals. be entrepreneurial goes beyond the knowledge acquired in the classroom, it takes courage, creativity and being different from others. Are characteristics necessary to attract customers and thus generate profits for your company. In entrepreneurship there is also Startups model, that is, it answers not only about what a particular company intends to sell, but jointly, how the products/services are made, their differential and importance, in addition to determining what their niche is, and how it will be obtained the expected profit (Marques, 2020).

As the main theme of this article, there are the challenges of undertaking in the area of Medicine, since it grows exponentially the number of doctors who opt for ventures to obtain a greater financial gain, either in the area of health, as is the majority, or in other business areas. As during graduation, this professional does not attend no discipline related to financial management or marketing, he tends to look outside the academic environment for tools and methods of knowledge related to administration, and that is where the first challenges to be faced arise.

The doctor, in his daily life, always makes decisions in moments of great pressure and euphoria and most of them are assertive, that is, he takes great risks, however this is not enough to be a good entrepreneur. without the study theory, how to successfully undertake, as it is found in different hospital environments, clinics of others, the medical professionals do not find it easy to align their activities with market demands (Aveni & Morais, 2021).

Because it is a very recent topic, there are few articles that deal with entrepreneurship in the area of health, what you find most are articles on reliable and reputable websites about the entrepreneur doctor, however Published works on entrepreneurship and health are quite scarce. So, for a better understanding and execution For this research, materials from reliable websites and electronic magazines were used, which do not compromise the quality of this file. Therefore, this article aims to describe the main marketing challenges that physicians entrepreneurs face today.

2 METHODOLOGY

This article adopted a methodology of bibliographic and integrative review, and the approach chosen was of the type qualitative. In this way, Marconi and Lakatos (2021) explain that literary research is an in-depth and broad analysis on a given topic in available publications. They also reiterate that it is the basis for all academic research. At the Regarding the integrative review, it aims to order and summarize the results obtained. Therefore, the approach qualitative analysis analyzes human behavior, that is, it analyzes the way of thinking of individuals in a given community (Gil, 2020).
Regarding data collection, it was carried out in the following indexing bases: Scientific Electronic Library Online (SciELO); Medical Literature Analysis and Retrieval System Online (MEDLINE via BIREME); U. S. National Library of Medicine (PubMed via NCBI); and Cochrane Library. However, because it has a current theme, it was necessary to visit websites and reliable electronic journals in the area of health and administration, without compromising the ethics and credibility of the present article. The descriptors used were: “Challenges”, “Entrepreneurship”, “Doctor”, “Health”, in the Portuguese, English and Spanish.

Thus, for a good performance of this work, inclusion and exclusion criteria were defined for the studies. THE a priori, to be classified as eligible to be part of the article, articles, dissertations, books and current publications, with a maximum of five years of publication, that is, research published between 2017 and 2022, which were in Brazilian Portuguese, English and Latin American Spanish. A posteriori, the works that did not fit in the previous criteria, were excluded from this article.

3 RESULTS AND DISCUSSION

Nowadays, a lot is heard about entrepreneurship in the health area, especially from the doctor entrepreneur, which in the past society could not observe a simultaneity between both, that is, the entrepreneur was the one who lived only between the four walls of an office and the doctor, that individual fully dedicated in hours infinite in the hospital with their patients. However, things have changed in a beneficial way, the doctor can now exercise their role of caring, as well as undertaking and profiting from their work activity.

Thus, to undertake means to do something that has a significant and diversified impact on people's lives, better.

In other words, it is the ability to idealize, set up and carry out new businesses, even change existing companies, undertake challenges and risks are synonymous. Other authors cite the concept of entrepreneurship as the ability of an individual to identify problems in certain areas and seek solutions to these obstacles, in addition to having real impacts on the human daily life (Hashimoto & Borges, 2020).

Thus, some researchers believe that the high competition is one of the reasons that make the doctor seek undertake, as this would make a difference to their colleagues. With technological innovation, much has been sought for networks social as a showcase, where some expose their personal life to generate a rapprochement with their future client/patient, this occurs in parallel with the dissemination of their enterprise (Andrade et al., 2017).

However, not everyone still sees this with good eyes, as is the case of the author Pavaroni (2022), his criticism is punctuated in newly graduated doctors who believe that starting a business is easy and end up falling for the “siren song”. He quotes in his matter for the medical academy, that a professor at the Institute of Radiology (InRad) at Hospital das Clínicas da Faculdade of Medicine at USP (HC-FMUSP),
Giovanni Cerri, reports that 30% of his students do not want to follow a medical career, who chose to be entrepreneurs and startup founders. Thus, Pavaroni(2022), explains that this is scary and is taking place because of the technological evolution and the access that anyone can have on the different professional areas, as well as doctors feel the need to be diverse.

Throughout his work, he explains that newly graduated doctors are not satisfied with a degree, or even a well done residency is not enough to keep the office full, but the dissemination of its services, either through social media, television, radio or “word of mouth”. Pavaroni (2022) criticizes that these advertisements seem more important than the medical certificate, and end up being confused with easy entrepreneurship.

However, the challenges faced by the entrepreneur physician are not few, among them is to make a good business plan, organize your schedule, understand marketing logistics, people management, manage the accumulation tasks, take care of financial management and align with market demand. First, the business plan second Hashimoto and Borges (2020), should be done to try to reduce the risks of the venture, the doctor who, before starting it, define all your plans, highs and lows, for example, as your main competitors and differential, will reduce the likelihood that your company will not get good results.

In this way, organizing the agenda normally requires attention, however, when it comes to the busy life of a doctor, it needs to be redoubled, those who are starting to undertake, need to do it individually, an organized way not to compromise your opening hours, and over time you will need a secretary, that is, delegating some functions, and thus will be able to be more successful in the entrepreneurship activity (Morsch, 2020).

In terms of methodological logistics, as in any other market, the entrepreneur doctor must pay attention to the operation of the market, create attractions to attract customers/patients, observe the country’s economy, that is, know how to behave in the face of an economic crisis. Therefore, the doctor himself needs to overcome the barrier that saving lives need not profit from it (Sator et al., 2022). In people management, it refers to those companies that have a certain time in the market and according to its rise it is necessary to add people in the functions, this is a point crucial for the doctor, as he must manage as a good leader, motivating his employees and keeping the team united in pursuit of service excellence (Demo, 2018).

Another challenge to be overcome is the accumulation of tasks, it is known that the life of a doctor is already troubled by activities, however when he decides to undertake, he will need at least one person helping him to seek balance between administrative and in-office consultations (Santos, 2022). Regarding financial management, there is the understanding of the finance, as in medical graduation this discipline is not offered, it is up to the doctor to seek ways to obtain this knowledge, there are several management programs on the market and also the vocation to undertake (Aveni, 2019). And finally, one has to align the market demand, that is, what is being seen and requested the most, the doctor must be attentive to each service request (Fonseca, 2019).
Andrade et al. (2017), citing in their research on the doctor, entrepreneurship and quality of life, highlights that Most physicians do not seek administrative technical training, which hinders their results and the

overcome their challenges. The study of these authors was carried out with a total of 36 physicians, who have in the same building in the State of Rio de Janeiro, in the city of Niterói. They aimed to assess self-perception of these professionals in terms of their knowledge, practice and connection with entrepreneurship, in addition to Moreover, it was evaluating and correlating these data with the levels of satisfaction in their quality of life. As results explained that:

“It made it possible to observe that physicians with an autonomous profile (full or partial) are self-employed service providers who accumulate the functions of technicians in medical science and managers of their own offices. This last function requires the presence of an entrepreneurial spirit, focused on the structuring and development of the small (or micro) business and the exercise of routine administrative practices, aimed at its operation. However, most of the doctors surveyed do not see themselves as service providers, nor as entrepreneurs, nor as routine administrators. They see themselves only as doctors, in their technical role. In addition, they have little administrative knowledge, both basic and strategic. These few existing knowledge were not acquired in the Faculty of Medicine” (Andrade et al, 2017, p. 08).

Admittedly, most doctors feel overwhelmed and short on time. Now, a good part feels happy and chose the profession they chose for life, but this is different when it comes to entrepreneurship, for lack of knowledge and without management tools, better said administrative.

In view of the results exposed, it is clear that there are several challenges faced by physicians in the art of undertake, it is not just those items, they go beyond, and to overcome them, the doctor needs to seek to have a base in management of business, because according to (Colichi et al., 2019), it covers the evaluation of enterprises, as well as their errors and guidelines for good management. These disciplines and management, unfortunately, are not offered in the curriculum of Medicine, which nowadays could be rethought.

The problem exposed in the results is in relation to physicians who are starting a medical career associated with of entrepreneur, believe that it is easy to create and maintain a company, and even more do it in search of reduction of shifts, for example, which is considered very tiring, but they are not planned with a good administrative base and end up having difficulties from internal and external factors (Tomé & Aidar, 2019).

What you see on social networks is an aggressive marketing of doctors offering their services, each one looking for their own differential, some examples are Camila Karam, a dermatologist, who already invested in social networks during her graduation and recently launched your clinic. Flávia Jú, who is a plastic surgeon and started her exhibition with the intention of traveling with less costs, but of time has created suture courses and has an online store and launches projects such as the medical godfather. The cardiologist Neif Musse and his two sons Ricardo and Guilherme, also cardiologists, are entrepreneurs and travel around Brazil with the course of Electrocardiogram. Therefore, all these examples are from some
entrepreneurial doctors who used social networks as a means of attracting customers/patients and, of course, aiming at profit.

There is no way to be an entrepreneur in any area and not invest in marketing, it is one of the most important to attract customers, and can be done in several ways, through TV, radio, social networks, flyers, outdoors or best of all, through “word of mouth”. Health marketing is used to increase the amount of clients in a clinic, for example, always looking for a good communication strategy and the doctor when he is in the network social media such as Instagram, for example, it is the very image of your company (Netto, 2019).

It was even mentioned on competitiveness, there is the argument that the increase in private schools of Medicine has created this “boom”, so the migration of doctors to entrepreneurship, however, technological innovations are also one of the reasons, and it arises for companies to improve their service, and in no other sector that generate profit would be different, primarily from health, which should always seek the well-being of the population. So find technological solutions such as Digital Medicine and Telemedicine is a differential for a clinic or office, including the adherence to medical record software (Bottoni et al., 2019).

4 CONCLUSION

The doctor who undertakes, seeks to diversify in a market that becomes increasingly competitive. He must acquire the basic knowledge of administrative management, but being aware that it requires dedication, attention, creativity and a lot of courage, although the doctor, in general, does not need the company to have his gain main. However, if he wants to increase his profit, it is through the entrepreneurial activity that he will achieve, going through all the mishaps you will encounter along the way.

The objective of this writing was achieved, since the main marketing challenges that the doctors who decide to undertake find in the present day. In addition, examples of physicians who use social networks to attract customers, taking advantage of personal marketing that helps them to get closer to the future client and creates a link of trust with the company of these professionals.

Thus, this article is of paramount importance for medical and administrative sciences, as it is a new study and also about the difficulty to find articles that deal with this theme, it will serve as a basis for future studies in this segment.

ABSTRACT
According to the World Health Organization (WHO) adolescence is related to period gives life in between you 10 and 19 years old, at the which occur deep changes, characterized mainly by rapid growth, emergence of the characteristics sexual secondary, awareness gives sexuality, structuring gives personality, adaptation environmental and integration Social. O century XXI, The was gives modernity, The pregnancy precociousness is still a subject little discussed in Brazilian schools and families, in the However, sex life is starting earlier and earlier, and as the years go by passing this initiation becomes even more precarious. The present study was carried out through a lecture with the use of slides using the data show as a resource, addressing the prevention of teenage pregnancy, being taught by students of the first semester, in the discipline of Interaction in Health in the Community (IESC), of the medical course at FAP-Araripina, in 2022. Two polls, The first survey was looking for know O level in understa Preview about education sexual intercourse, before the proposal presented. After that, a second survey was carried out to regarding the level of understanding about sex education after explanation of the theme. THE lecture with O theme prevention gives pregnancy at adolescence approached together to the students you following matters: O what It is to be adolescent, consequences gives pregnancy at adolescence, planning familiar and methods contraceptives with The goal in awareness. This activity took place in a didactic way with student interaction, in what you same take away your doubts The respect of theme. In relationship The survey carried out about the knowledge before and after the lecture, it is possible to notice that, despite having a diversification of knowledge levels before the lecture takes place, in which there is prevalence of level 8, referring to a good
Principles and Concepts for development in nowadays society: The marketing challenges faced by the medical entrepreneur

The degree of knowledge. However, it was notable what occurred a increase significant in that grade, already what there is one prevalence From levels 9 and 10, showing the importance of spreading knowledge to this target audience. Therefore, this project provided the apprentices of the State Technical School (ETE) with Pedro Muniz Hawk, in Araripina-PE, a larger knowledge about O Subject approached, making them aware about at consequences in one possible pregnancy at adolescence, in addition from that, The lecture generated one great satisfaction to group, one turn what he was important to pass on great content relevance in days current.

**Key words:** pregnancy, adolescence, school, education.

1 INTRODUCTION

Second The Organization world in Health (WHO) The adolescence it is related to period gives life in between you 10 and 19 years old, at the which occur deep changes, characterized mainly by rapid growth, emergence of the characteristics sexual secondary, awareness gives sexuality, structuring gives personality, adaptation environmental and social integration.

O century XXI, The was gives modernity, in big ones changes in values morals and in behaviors, The pregnancy precocious still It is a theme little discussed in the schools and in the Brazilian families, however, sex life is starting earlier and earlier, and measure what you years old they go passing it is initiation becomes still most precocious. THE pregnancy in adolescence most of the time it negatively affects the family relationship and in school life, moving the teenager away from school and possibly restricting your upcoming professional. The pregnancy seen at this stage is a reality in Brazil and, despite susceptible in any class Social, you factors economic and Social are determinants us indexes statisticians. (RODRIGUES; SILVA; GOMES, 2019).

Furlani (2011) reports that an unplanned pregnancy in adolescence requires a greater attention. The strategy of developing in young people responsibility for the acts of practice sexual, well as The understanding From effects in one pregnancy no planned, has been O focus in some investments educational. In wake up with The author, create mechanisms what inform, guide and raise awareness you teenagers about sexuality, mainly about sexual practice and its consequences, is relevant to awaken us young people O interest in to meet all you scratchs arising in acts sexual, From methods of protection and prevention. It is essential that they receive effective guidance for the construction in your maturity and, so, have The capacity in to take decisions conscious and prevent an unplanned pregnancy.

At the Brazil, O Ministry gives Health (MS) has worked in manner articulated for reduce The rate in pregnancy at adolescence. The percentage still lies 18% above gives high worldwide rate, but as efficiency gains in joint actions, it is possible, in addition in decrease O indicator in yes, improve others important numbers, as of miscarriage , birth premature and mortality maternal, evasion school, potential I established ment in dysfunctional and vulnerable families, abuse of alcohol and other drugs, as well as as in situations in abandonment, abuse, violence and lack in protection effective at children and to the adolescents (BRAZIL, 2010).
Thus, this work becomes essential to open discussions on the subject, through lectures and educational activities aimed at raising awareness among students and inviting them to reflect about the consequences in one pregnancy no planned.

2 METHODS

This article was carried out through a lecture at ETE-Pedro Muniz Hawk, approaching the theme about the prevention gives pregnancy at adolescence, being given by the students of first semester, at subject in Interaction in Health at Community (IESC), of course of medicine gives FAP-Araripina, in year of 2022.

In addition, as an intermediary means, the slide presentation was used in the lecture using data show to make the environment more visual and generate greater understanding among teenagers. Thus, the resource used was the presentation in Power point.

In sequence, two surveys were carried out, the first survey sought to find out the level of prior understanding of sex education, before the proposal presented. After that, a second survey was carried out regarding the level of understanding about education sex after explanation of thematic.

The inclusion methods for this article were selected adolescents from 14 to 18 years. Using the method of excluding students who are outside this range age (14-18 years).

Against of high index in teenagers pregnant at the County in Araripine, emphasizing the Alto da Boa Vista I neighborhood, where of the 69 pregnant women followed in the pre-Christmas, 20 are teenagers, according to data from the Citizen's Electronic Record (PEC), it is done required to debate about gives current situation. of this form This one job will promote discussion on the topic while raising awareness among students for the related issues The pregnancy and the use of contraceptive methods.

This research will also bring information to the school community about the consequences in one pregnancy unwanted, already what The same affect directly O educational performance, where these adolescents move away from school activities due to the care needed before and after this phase. work with teenagers pregnant in wake up with moreira et al. (2008) implies in challenges for understand This one world full of subjectivity and contradictions.

3 RESULTS AND DISCUSSION

It was observed, at first, in the Family Health Strategy-Alto da Boa Vista I, one determined the amount in teenagers pregnant. Of that form, felt The need in address The "prevention gives pregnancy at adolescence", theme That what he was reinforced with The percentage issued fur PEC, with that, were used topics, as "O what It is to be Adolescent?"; "Consequences gives pregnancy at adolescence"; "Planning familiar" and "Methods Contraceptives”— with The goal in awareness.
THE adolescence, phase of cycle vital in between The childhood and The adulthood, It is characterized per biopsychosocial changes peculiar to each being, transforming habits and consolidating behaviors. In this phase, you teenagers they can experience new experiences, many times with scratches against of vulnerabilities, being one from them The precocity gives activity sexual, moved fur pleasure momentary, ignoring The possibility in pregnancy and contamination and/or spread of sexually transmitted infections (FAIAL et al, 2019).

In general, teenage pregnancy is classified as risky, because represents a biological risk situation (for both mothers and newborns) born), and exist evidence in what This one phenomenon still reverberates in way negative in school dropout rates (both before and after pregnancy), impacting the level in schooling gives mother, decreasing your opportunities future (DAYS; TEIXEIRA, 2010).

Second Rock (2006) O planning familiar presupposes one assistance what be likely to offer at alternatives possible in methods contraceptives, well as O knowledge in your indications, contraindications and consequences in use, ensuring elements necessary for The free choice of method what best if adapt The women or to couple. O planning familiar also includes O side dish From couples infertile. With O development technological at the field gives contraception and you advances at the scope gives health sexual and reproductive, provide information and means related to the methods contraceptives existing It is one of best shapes in accession The a prevention program. Offering choices to the young woman, or even to the couple, generates safety and, consequently, best use of method. This one It is a time very important, implies in one life sexual safe and satisfactory, by having The capacity in reproduce and The freedom in decide about When and how many times he must do it (BERLOFI you in the, 2006).

Given this condition, the activity was carried out on July 4, 2022, at the Monday, with The approach From topics, presented previously, at the auditorium gives ETE - Pedro Muniz Hawk, with The use in methods quantitative, in responsibility and direct collaboration of the students, where it was given to the students to poll both at the beginning of the lecture and at the end to be answered by them. By having as result, of that survey, a total in 99 answers about O your knowledge prior before and after activity.

In wake up with The figure 1, It is possible to notice what, although in be one diversification of knowledge levels before the lecture takes place, there is a prevalence level 8, referring to a good degree of knowledge. However, analyzing Figure 2, it is clear that there has been a significant increase in this degree, since there is a prevalence of levels 9 and 10, showing The importance gives propagation in knowledge for that public-target.

Thus, it can be seen that the lectures are opportunities to learn more about a particular issue that, in a very significant way, can impact the way of working, productivity, studies and even the way a person he can to see the world.

4 CONSIDERATIONS FINALS

This project proposed to elaborate a dynamic and reflective lecture, in a way that would add knowledge, as well as clarify the young people of the ETE school - Pedro Muniz Falcão on the prevention of teenage pregnancy. for the work was not merely expository, we sought the help of tools that could become more absorbable The thematic. can, so, to arrive The some conclusions: although in a public well diversified, the teenagers, after the lecture, developed a greater knowledge (a addition) on The pregnancy in adolescence.

In addition, the lecture generated great satisfaction for the group, since it was important to pass on a content of great relevance nowadays, as well as open space for possible doubts that the students present could have about the theme.

ABSTRACT
This article discusses the definition and measurement of organizational culture and its impact on organizational performance by reviewing existing empirical research and the link between models and organizational culture and performance. This work aims to analyze the degree of influence of the organizational culture and make recommendations for improvements applicable to the public and private sectors to increase the efficiency of the services provided and the organization in its clients or the community. An analysis of a large body of literature found that organizational culture has a deep impact on the diversity of organizational processes and their performance. It also describes different dimensions of culture. Research shows that if employees are engaged and share the same norms and values as the organization, they can improve performance to achieve the organization's overall goals, at the same time, the company must understand and grasp the complementary relationship between strategic management and organizational culture can help improve quality and overall competitiveness, promote access to quality, sustained and healthy development.

ABSTRACT
Evaluation is an important and founding part of the processes of teaching and learning, tak- ing this into account, this work is resultant from inquiries and reflections concerning evaluation during remote teaching. To address this issue, theoretical research was carried out about essential concepts related to evaluation. Due to the Covid-19 spread and the necessity of social isolation, emergency remote teaching was a path full of challenges and learning opportunities both for teachers and students. This study can be defined as experimental and applied research, using quantitative and qualitative analyses of the data obtained from Google Forms, which was the evaluation instrument chosen at the end of the didactic sequence project. The results indicate that evaluation should be done during the whole teaching and learning process and that the overall performance of students must be considered. This research also points out the advantages and disadvantages of digital evaluation instruments in emergency remote teaching.

Keywords: remote teaching; learning; evaluative instruments; Google Forms; evaluation.

1 INTRODUCTION
One of the great challenges in the educational area has been to incorporate new technologies in the teaching and learning processes. With the outbreak of the Covid-19 pandemic, this challenge became blatant, as teachers had to make use of digital information and communication technologies to develop their classes. In this context driven by disease and necessity, with the restrictions imposed on social interaction, digital information and communication technologies became part of the daily lives of many teachers and what came to be called remote teaching, a new terminology for teaching, emerged. developed remotely through digital information and communication technologies, using digital artifacts such as computers, cell phones and the internet.

In this context of remote teaching with the use of digital technologies as a way of simulating reality and social interaction made impossible by the high risk of contamination of the Covid-19 pandemic, the research questions that guide this work emerged: how to evaluate learning during teaching remote? What are the advantages and disadvantages of digital assessment instruments used in emergency remote teaching?
Therefore, the objective of this work is to analyze the advantages and disadvantages of digital evaluation instruments of the results of these instruments obtained through an applied research, which follows a quantitative and qualitative approach.

The research was carried out in two distinct phases: first, a didactic sequence was elaborated with the theme "chocolate" that was applied as an extra activity during remote teaching, the culmination of this didactic sequence was the application of an instrument to assess the understanding of a text oral language in English built as a Google Classroom form. In the second phase, the collected data were analyzed quantitatively and qualitatively. Both phases were carried out in a public school in the state network of Minas Gerais with high school classes.

This research was developed as a conclusion work for the specialization course in basic education teaching at the Federal Institute of Minas Gerais, Arcos campus; and was carried out without funding from research funding agencies.

This work is organized as follows: after this introductory section, there is the methodology section that describes methods, approaches and procedures used in the execution of this research. Then, the theoretical foundation based on concepts and principles about assessment in education, assessment instruments, project pedagogy, didactic sequence, English language teaching during remote teaching and during face-to-face teaching is presented. Soon after, the data obtained in this research are presented, analyzed and discussed in the light of the theories selected in the theoretical foundation section. Finally, the final considerations of the work and the references used in this article are presented.

2 METHODOLOGY

This research was the result of a course conclusion work of a specialization in teaching in basic education. In the first phase of the research, a pedagogical practice was carried out in the English language classes of a public school in the State of Minas Gerais, through the application of a didactic sequence composed of teaching activities and learning assessment instruments, in order to evaluate the results of an evaluation instrument applied through Google forms, still in the context of the Covid-19 pandemic, at the end of 2021.

In view of the characteristics of this research, it can be defined as an exploratory research, since there is still little knowledge built on assessment and assessment instruments in remote teaching; at the same time that this research is also explanatory, in the attempt to provide data and clarifications about a certain phenomenon. In addition, this research can still be classified as an applied research, as a pedagogical proposal is presented, which is put into practice to obtain and analyze the results of this pedagogical practice (BRASILEIRO, 2021, pp. 76-77).

In order to fulfill the scope of surveying the phenomenon investigated, a bibliographic review was carried out, based on the reading and recording of materials published in books, specialized journals, electronic and digital information networks (cf. MARCONE and LAKATOS, 2001).
During the first phase of the research, due to social isolation and emergency remote teaching, data were collected mostly through Google forms, within the Google Classroom educational platform, as it was the platform used by the school. Google forms were designed as a “structured instrument in a series of questions” (BRASILEIRO, 2021, p. 84). Google forms allow the collection of quantitative and qualitative data.

In the second phase of the research, after the collection procedures, the data were tabulated, classified and categorized according to their quantitative nature and qualitative analysis methods, so that this research makes use of the quantitative approach related to the qualitative approach.

Due to feasibility and time issues, data related to an assessment instrument used at the end of a listening comprehension activity in English will be presented and analyzed. These data were tabulated, classified, categorized and checked by two researchers and will be presented in the results presentation and data discussion section.

3 THEORETICAL FOUNDATION

3.1 GENERAL PRINCIPLES AND CONCEPTS ABOUT ASSESSMENT

One of the questions of this research is directed to how to assess learning during the emergency remote teaching regime, which leads to a reflection on the learning assessment process. This question about what is evaluation and how to evaluate, leads us to a long and recurring debate in the educational field about the importance of evaluation, the attempt to overcome the merely quantitative aspect and the exclusively classifying view that has been related to the process of evaluation. Assess learning. As Luckesi (1999, p. 18) criticizes: “Our school pedagogical exercise is crossed more by a pedagogy of examination than by a pedagogy of teaching/learning.” A starting point for changing this perspective would be the understanding of evaluation as one of the “constitutive elements of the teaching-learning process”, as Luckesi (1999) says. In this way, assessment, understood as a process and not just as a result, cannot occur in isolation, dissociated from everyday school life.

Thus, evaluation can be understood as part of the teaching and learning process, which takes place continuously in the educational process, because as highlighted by Valadares and Graça (1998, p. 12):

> a central role in the entire educational experience, as it allows us to know the situation of the student in the different stages of his cognitive evolution and to base decisive value judgments, not only for the improvement of his learning, but also for the valorization of future educational experiences (emphasis by the authors).

Understood in this way, assessment permeates any and all educational experience. Such experiences should be promoted in order to develop meaningful learning, which according to Ausubel et al. (1980), it can only be so conceived if the student learns “significantly new ideas if, and only if, these are incorporated in a non-arbitrary and substantive way” in their cognitive structure”. Roughly speaking, paraphrasing Ausubel et al. (1980) meaningful learning occurs when students appropriate knowledge and this knowledge
becomes part of their cognitive structure. According to Valadares and Graça (1998) significant learning cannot be confused with active learning (when the learner actively participates in the construction of knowledge), nor with discovery learning (when the learner discovers something by himself, without the help of others).

Given the inherent complexity of the evaluation process, a great challenge for teachers and educators would be how to evaluate, which procedures or instruments to use, since the evaluation process permeates the educational process. To be clear about how to evaluate, it is necessary to know: 1) the general principles of evaluation; 2) the characteristics of the evaluation process; 3) the types of assessment. Such information will be presented in summary tables:

Table 1: General principles of evaluation

<table>
<thead>
<tr>
<th>General principles of evaluation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assessment is an integral part of the teaching-learning process.</td>
</tr>
<tr>
<td>Evaluation requires a prior and clear definition of what is intended to be evaluated and the purposes in view.</td>
</tr>
<tr>
<td>Evaluation requires the choice of various evaluation techniques and instruments depending on the objectives and purposes.</td>
</tr>
<tr>
<td>Evaluation requires taking advantage of the strengths of each assessment instrument and minimizing the effect of its weaknesses.</td>
</tr>
<tr>
<td>Assessment is a necessary means to an end (improvement of student learning) and not an end in itself.</td>
</tr>

<tr>
<td>formative assessment</td>
</tr>
<tr>
<td>Summative evaluation</td>
</tr>
</tbody>
</table>

As can be seen, the evaluation process should integrate general principles in the formulation of evaluations, integrate different evaluation instruments and different types of evaluation. In other words, the evaluation process should be more eclectic and not just synthesized in a single moment of the test or test, which are usually formulated to be a summative evaluation or the result of the end of an evaluative stage.

In addition to this inherent complexity of the assessment process, the context of the Covid-19 pandemic imposed another challenge that would be to propose the adaptation of the teaching, learning and assessment processes for emergency remote teaching. Technological advances have significantly impacted
eductional means and processes, evaluation has also undergone these changes, the use of digital platforms, which was already large, was intensified by the pandemic context, which required the use of new evaluation instruments and a readjustment of evaluation processes. for online platforms and environments.

3.2 COVID-19 PANDEMIC AND THE IMPACTS FOR EMERGENCY REMOTE TEACHING AND TEACHING, LEARNING AND EVALUATION PROCESSES IN EDUCATION

Fernandes, Isidorio and Moreira (2020) indicate that the coronavirus pandemic suddenly and untimely brought major impacts to the educational scenario: specific legislation on emergency remote teaching was introduced; educators, teachers, students and parents had to adapt to a reality of social isolation, interaction mediated by digital technologies and emergency remote teaching; there was no time to train teachers for the new reality; public policies were not implemented to assist teachers and students with regard to access to digital technologies. In this scenario, in which everything was done in a hurry, in a contingency and emergency way, there were limitations but there were also significant progress in the educational area.

Continuing, Fernandes, Isidoro and Moreira (2020, p. 3) explain that emergency remote learning should not be confused with Distance Learning (or EAD), since remote learning:

differs from Distance Learning (EAD) by the fact that in Remote Learning, the student has a synchronous follow-up by the teacher, that is, teachers and students can, through digital means, achieve the necessary interaction for the application of the class at the time of face-to-face classes. In addition, the student has instant feedback from the teacher of the discipline in real time, in most of the digital resources used, the teacher can reproduce the notebook screen and various media files, whether Powerpoint or videos.

As the name implies, emergency remote teaching was introduced in order to solve an urgent problem, which was the reestablishment of teaching and learning processes remotely for students, who until then had been without classes due to the pandemic and the high contagion of the virus. coronavirus. EAD is a form of education that serves students who choose this modality, by offering distance learning activities, tutored or self-monitored, in which the student has greater autonomy to learn through instructional material properly prepared for distance activities.

Having made these reservations, it is necessary to consider that in the context of emergency remote teaching, teachers and educators, with little or no training, had to readjust teaching, learning and assessment processes that were previously carried out in person, to be developed on online platforms, like Google Classroom or Microsoft Teams, for example.

For Casatti (2020, sp.), the pandemic accelerated the process of integrating digital technologies into the educational scenario, creating opportunities...
for the digital and cultural transformation that is so necessary in teaching, uniting innovative pedagogical practices, such as hybrid learning and active methodologies, with intelligent educational technologies, which enhance the abilities of the student to learn and the teacher to innovate.

It is in this context generated by the pandemic that teachers are challenged to use digital technological tools that until then were used rarely or sparingly, such as videoconferencing or video calling programs and applications (such as Google Meet, Zoom); digital forms (like Google Forms); use Youtube videos as an educational resource; use virtual learning environments (VLE) to provide class materials; among other possibilities and innovative solutions.

Souza and Souza (2016) indicate that Google Classroom (or Google Classroom) is an online teaching platform or a virtual learning environment (VLE) that contains several tools that can be used for online teaching and learning processes, such as Google Meet (program for videoconferencing, video class); Google Drive (repository of documents that are saved in the cloud); Google Docs (a program that allows the creation, editing and archiving of various types of files); Google Forms (a program that allows the creation of forms, very useful for creating tests and online tests); among other programs and resources that can be used for educational purposes.

Online activities can be organized in a didactic sequence (DOLZ, NOVERRAZ and SCHNEUWLY, 2004, p. 97) linked to the pedagogy of projects (GIROTTO, 2005; CIEB, nd). In the case of teaching English, the didactic sequence can be organized around written, oral, and also multisemiotic textual genres, according to the guidelines of the National Common Curricular Base (BRASIL, 2018), which will be discussed in the next section. theoretical section.

3.3 TEACHING SEQUENCE

The Didactic Sequence “Chocolate” was elaborated from the need to work the four language skills (reading, writing, listening and speaking) in English classes in a public school, in basic education, more specifically in high school, taking into account what the National Curricular Common Base (2018) proposes, with regard to the teaching of competencies and skills that [...] enable [young people, students] to mobilize and articulate knowledge of these components simultaneously with socio-emotional dimensions, in learning situations that are significant and relevant to their integral formation (BRASIL, 2018, p. 481).

In this sense, the activities proposed in this didactic sequence were designed based on the need for the target audience, that is, public school English language learners, to work with English language skills and abilities that prepare them for meaningful language learning. English, the socialization of the English language and social interaction through language.
In this way, the written, oral and multisemiotic texts selected to integrate this didactic sequence were proposed with educational purposes that lead to “the consolidation and expansion of the skills of use and reflection on languages” (BRASIL, 2018, p. 482).

With regard to the preparation of the didactic sequence, the theoretical principles of Dolz, Noverraz and Schneuwly (2004, p. 97) were used, which define the didactic sequence as a “set of school activities organized, in a systematic way, around a genre”. In this case, we extend the understanding of textual genre (MARCUSCHI, 2008), which is not limited to oral or written texts, but also encompasses multisemiotic texts, in which there is the presence of more than one semiosis or way of producing meanings. Videos, for example, can encompass several semioses and can be considered as multisemiotic texts.

3.4 PROJECT PEDAGOGY

According to Hernández (1998), Hernández and Ventura (2000), Girotto (2005), project pedagogy emerged from the need to break with the traditional teaching vision, based on memorization, repetition and fragmentation of knowledge into stagnant disciplines, bringing a new way of pedagogical practice based on problem solving, on the integration of lived practices with classroom practices. Thus, for Hernández (1998) the work projects innovate the pedagogical posture, insofar as they bring a new way of understanding and experiencing the educational process, due to the challenges and problems faced by today’s society.

The conception of project pedagogy, according to Girotto (2005) is a resignification of the school vision, essentially interdisciplinary and has as its starting point real demands of the context in which it is inserted, has in the teacher a role of mediator and encourager of learning actions. The term has a strong influence on the defenders of the so-called “Active School” whose main representative is John Dewey.

The project to be developed is immersed in dialogue, exchanges and debates between students and teachers. It arises from a need, a guiding problem, which encourages searches, research and resolute actions. Students and teachers work collaboratively, the work can involve several disciplines, the pedagogy of projects intends to go beyond the delimited vision of the curriculum.

The student is given the opportunity to act in their learning process, in the pedagogy of projects, the active and conscious participation of each individual is demanded, with their previous knowledge and their individual contributions, which give rise to a transforming education and significant learning (cf. CIEB, nd).

The design of the project requires planning and a clear objective, although it has the flexibility to adapt to the needs and experiences over the period. The evaluation is a primordial part, because it will happen all the time, verifying participations and actions in a quantitative way, but above all qualitatively. At the end of the project, it is hoped that learners will reach an understanding of concepts and contents, and be aware that practical actions can transform society.
Based on the theoretical principles of project pedagogy and the organization of the teaching and learning process, teaching activities and assessment instruments were developed to teach English language to high school students in a public school, in the context of the pandemic, thinking-if in a differentiated education, with active participation of the students, and that could contribute to significant learning. The pandemic context was challenging for teachers and students, and with regard to teaching English, the challenges seemed to be greater because teaching language involves teaching language skills (reading, writing, listening, speaking) and intercultural understanding, since the English language is used worldwide by speakers of diverse cultures.

3.5 ENGLISH LANGUAGE TEACHING IN THE PANDEMIC CONTEXT

Considering the context of the Covid-19 pandemic, English language teachers found limitations in the teaching platforms provided by city halls and state governments. English language tasks were often designed just to work on reading and writing skills, with speaking and listening comprehension skills being little worked or being left out. Some English language teaching theorists indicate that the four language skills (reading, writing, speaking and listening comprehension) must be worked on for students to develop the ability to communicate in the foreign or additional language they are learning (CELCE-MURCIA, 2012; GOWER; PHILLIPS; WALTER, 2005; HINKEL, 2010; WATKINS, 2005, among others).

Therefore, considering the pedagogical possibilities of using the Google Classroom platform and the need to work on language skills to develop the communication skills of basic education students, especially, the English language teacher can use the Google Room platform. Classroom as an educational resource, as a digital information and communication technology. In fact, the National Common Curriculum Base in the area of Languages indicates that teachers should work with digital technologies in order to develop students' communication skills and competences (BRASIL, 2018).

Therefore, the “Chocolate” Didactic Sequence project was designed to integrate various language skills, present in different textual genres, both written, oral and multisemiotic, in order to contribute to the learning of the English language, as well as for students to apprehend the intercultural dimension of the English language, which is used by different peoples and cultures around the world.

4 DATA PRESENTATION AND DISCUSSION

The “Chocolate” Didactic Sequence was designed to work with all language skills in English (reading, writing, speaking and listening), within a project pedagogy model, whose culmination was a teaching activity developed in Google Forms (Google forms) to assess the listening comprehension of high school students in a public school.

The project arose from the students' questions about how chocolate was made and why chocolate was so consumed all over the world, in view of this problem posed by the students themselves, a project was developed, based on the didactic sequences (DOLZ, NOVERRAZ and SCHNEUWLY, 2004, p. 97),
integrating different textual genres (MARCUSCHI, 2008; BRASIL, 2018). The project integrated to the Didactic Sequence “Chocolate” was planned to be developed in six remote classes, which depend on the active participation of students, as foreseen by the pedagogy of projects (HERNÁNDEZ, 1998; HERNÁNDEZ and VENTURA, 2000; GIROTTO, 2005) and the teacher mediation.

It was explained to the students that the participation in the project and the execution of the activities would occur on a voluntary basis and that the data generated would be used in research on English language learning and assessment, guaranteeing the right to anonymity as well as the right to withdraw from participating in the research at any time, following ethical precepts in research (PAIVA, 2019).

Initially, 58 students participated voluntarily in the research. During the classes, some students voluntarily decided to withdraw from the research and, in the last remote class, 38 participants remained (32 female students and 6 male students). As all classes contained evaluation, as we understand that the evaluation process takes place in a procedural way (LUKESI, 1999; VALADARES and GRAÇA, 1998), in view of space restrictions, we will present in this article only the data collected in the culmination activity of the Sequence Teaching “Chocolate”. In this activity developed in Google Forms (Google forms), students were asked to watch a video in English, embedded in the form itself. Students could watch the video as many times as they wanted, before answering the questions on the form. This activity did not have any kind of score or reward, avoiding the pressures of the exam and the final grade that Luckesi (1999) criticizes; that is, the students did the activity with the motivation to learn and without the pressure of achieving a grade to pass the bimester.

In the Google form, the video about the history of chocolate (https://www.youtube.com/watch?v=ibjUpk9Iagk) was embedded in the form. The video was chosen due to the theme of the proposed didactic sequence and because it is a multisemiotic text, which conveys written and oral information, moving images, which is in accordance with the BNCC proposal to use multisemiotic texts through the use of digital technologies (BRAZIL, 2018). Students could watch the video as many times as they wanted, with or without subtitles, and could respond to the questionnaire at any time they deemed appropriate, within the time window of one week. The form was designed with 20 evaluation items, with assertions to be marked as true or false, according to the content of the video. Although the evaluation items of the true or false type allow a chance for a 50% hit rate, the solution found to decrease the random hit rate was to increase the number of questions and structure non-obvious assertions, another aspect that increased the complexity. One of the items was the writing of the items in English and the audio of the video in English, which challenges the student to learn, to try to understand what he heard to judge an item as true or false.

After the deadline for accepting the students’ answers, the data were extracted through a spreadsheet of results in Google Sheets. After extracting the worksheet, the data were de-identified by labeling the students with codes, following this pattern STU01 (student 01), STU18 (student 18), etc. With the de-identified data, two researchers counted the number of hits and calculated the hit rate of each student, this rate demonstrates the percentage of hits in the listening comprehension activity that was evaluated. From these data, the following table was created:

**Table 1: Percentage of individual hits**

</tbody>
</table>

As can be seen in the table, 35 students or 92.1% of the students had a performance above 60% (which means an accuracy of 12 questions or more), only 3 students or 7.9% had a score below 60%. Nineteen students, that is, 50% of the participants, had a performance higher than 90% (that is, they got between 18 and 20 questions right), which indicates that these participants hardly got the questions right at random. A possible explanation for a high rate of hits may be the lack of pressure to achieve a grade. The pressure of achieving a grade ends up negatively influencing the results of an assessment, and this fits the “exam pedagogy” criticized by Luckesi (1999). When there is no pressure to achieve a grade, students perform the assessment activity without the pressure of external pressure, and their performance tends to be better. As the activity was aimed at learning English and the students played an active role in managing
the activity, being able to watch the video several times, with or without subtitles, and could answer the questionnaire when they felt comfortable, possibly this freedom of action in the learning process contributed to a high rate of correct answers within and above the 60% average.

Other data that reinforce the low probability of a random hit are the hit rates per question, which can be seen in this table:

Source: prepared by the authors

As can be seen, only questions 11 and 15 were in the range of 50% correct, indicating that these questions raised doubts in the research participants. All other questions had high accuracy rates, indicating that the research participants had a greater degree of certainty regarding the correct answer.

Obviously, this study represents the reality of only 38 high school students and their performance cannot be generalized, considering the limitations of this study. Perhaps if the same experience is replicated in another context, the results may be different. We emphasize that, as there was no charge for grades or rewards regarding the performance of students throughout the educational process of application of the “Chocolate” Didactic Sequence, it may be that this factor also influenced a better performance compared to a final summative evaluation. of bimester.

As all activities were designed to be carried out in the context of remote teaching, there was no strict control of other variants that may influence the test results, such as research on other sites to solve the questions and, even considering this hypothesis, it is necessary to consider that students had to research English language questions on the internet, expanding the student’s exposure to the English language and fostering skills other than linguistic ones, such as the ability to research. That is, online activities can awaken in students a more active role in solving problems posed by learning activities.
5 FINAL CONSIDERATIONS

Resuming the observations of Fernandes, Isidoro and Moreira (2020), emergency remote teaching created a challenging context both with limitations, such as infrastructure issues and access to digital technologies, but also brought space for innovation, such as carrying out online activities using features such as online video conferencing and online forms.

This study sought to first investigate the means of evaluating learning during remote teaching, in order to try to answer this question, the principles of learning evaluation were researched, and everything indicates that continuous, procedural evaluation, during all stages of development of a project focused on didactic sequences (which can be understood as learning modules), seems to be more successful than simply applying a summative assessment at the end of a learning period, a procedural assessment that is defended by Luckesi (1999) and Valadares and Graça (1998). Student performance during the learning process seems to be more important than measuring a grade, so it is preferable to measure student performance using percentages of correct answers, such as the percentages indicated in the data discussed in the previous section. In the case of students with low percentages of correct answers, the teacher must act through specific pedagogical interventions, such as reinforcement activities, and these strategies can only be worked in the classroom if the teacher has carried out the evaluation process.

Regarding the second research question, about the advantages and disadvantages of assessment instruments used during emergency remote teaching, it can be said that Google forms can be used as digital assessment instruments. In these forms it is possible to add text, image and video, allowing the use of multisemiotic textual genres, which is recommended by the BNCC (BRASIL, 2018). Google forms require dedication from the teacher for their construction, but after being prepared and saved in Google Drive, they can be reused, edited, modified. Another advantage of using Google forms is that student participation is recorded, the number of correct answers and errors is also recorded, and a spreadsheet can be generated with this information, even facilitating the analysis of student performance in a activity, indicating to the teacher possible changes in teaching strategies. Another advantage of an online assessment instrument is the autonomy and self-management experienced by students in this type of activity, the student plays an active role, being able to carry out online research to find solutions to problems. In this way, it can be said that digital assessment instruments have the potential to expand students’ learning opportunities.

As for the limitations of digital assessment instruments, the low level of control of the teacher in this assessment process must be considered, as the student can carry out the activity at his own home, in the lan house, in the school’s computer lab, on public transport, in the public library, anywhere. Another weakness of digital assessment instruments would be the consultation of others to solve the problem, which forces the student to interact with other people to help him in solving the problem, this can both be seen on the positive side, as the learner is learning with the most capable pair (VYGOTSKY, 1991; 1998); and on
the negative side, which would be the act of “gluing”. In any case, this possibility must be considered in the application of online activities.

Another limitation of this research was the participation of few students, only 38 participated, so the results of this research cannot be generalized. And although the data analyzed are of a quantitative nature, it is necessary to consider the performance of students throughout the development of a structured project as a didactic sequence must be analyzed qualitatively. As 92.1% of the students got more than 60% of the questions right, and 50% of the students had a performance above 90%, this indicates that they somehow managed to understand the video in English to answer the questions.

Finally, after applying the English language assessment activities, proposed for high school students, sewing a didactic sequence to a pedagogy of projects, it can be said that this combination successfully culminated during the emergency remote teaching period. It may be that the elaboration of a project linked to a didactic sequence gives work to the teacher, as it is a differentiated teaching methodology and in which the teacher participates as a mediator of the teaching and learning process, however, the pandemic context allowed putting into practice this way of teaching in which the student needs to act more autonomously and independently. In fact, the online teaching platforms that were used during the pandemic served as a great laboratory, in which there were successful experiences and experiences that indicated the need for reformulation, either in the way of teaching or in the way of evaluating.

ABSTRACT

The following study aimed to describe the etiologies and the respective clinical picture of syncope. Syncope is classified as a symptom of loss of consciousness due to reduced cerebral blood flow, secondary to an etiology. Such an event is often confused with other conditions associated with loss of knowledge, although to diagnose syncope it is necessary to rule out other alterations. Syncope is a condition whose pathophysiology is the Vasconstriction of blood in the brain, but it has several causes such as neuromediated, orthostatic, cardiac, cerebrovascular, and even idiopathic, resulting in different clinical conditions and complications, but the same outcome. Such an event needs to be investigated and detected immediately, by clinical history, physical examination, and complementary.

Keywords: syncope, symptom, hypoperfusion.
Random. This one event It is considered one recurrent emergency in health posts. The condition can often be confused with other findings and be mishandled or even remain undiagnosed (GNAN, 2019).

From an epidemiological perspective, syncope has a bimodal incidence, that is, it has a peak in late adolescence to early adulthood, with a focus on vasovagal presentation, followed by another peak in the third age, with a raise high post you 70 years old. emphasizing, what if treats in a problem common, with predominance around in 20% gives population in general (MORAG, 2021).

The following study aimed to describe the etiologies and the respective clinical gives syncope.

2 METHODOLOGY

It is in a study qualitative gives revision narrative in literature, made to discuss the particularities attributed to syncope. It consists of a extensive literature review, together with a flexible and replicable methodology at the level of reproduction in Dice and answers quantitative for questions specific. This one he was based on the platforms of SciELO, Pubmed, LILACS, Virtual Library in Health, PubMed, Google Scholar and other relevant scientific literature with the theme in the period of June 2022, using the following descriptors: Syncope, Cerebral hypofusion and Clinical Picture, in a combined or isolated form without delimiting a break temporal.

In total, 50 articles were found in Portuguese and English. The criteria in inclusion were you most current, to possess at expressions used in the searches at the title or keywords, or have it explicit in the abstract that the text relates to the association of the mechanisms related to the framework syncope, the data based on evidence and what had a clear and direct language. The discarded articles did not have the criterion in inclusion established, and/or presented duplicity, in addition at dissertations and theses and others studies without relevance to objective proposed. After have been restored target information, the reading of titles and abstracts was initially conducted, with intense exclusion in publications in this stage. Posteriorly, he was effective the reading complete of the 25 texts. As an axis of analysis, we initially sought to classify the studies how much at particularities gives sampling, grouping those ones whose samples are about you agents causal and O painting clinical of stricken. THE leave so, continued with The analysis gives reasoning theoretical From studies, well as The Note of features general From articles, such as O year in Publication and language, followed in their goals. Finally, there was an appreciation of the applied methodology, results obtained and discussion. Specifically, for to analyze The production scientific identified, if used specific quantitative and/or qualitative data processing techniques, by having been made to analysis in each one of the texts.

3 RESULTS AND DISCUSSION

The search of the articles that supported this article detected 250 references to respect of main considerations clinics about The syncope in the bases in Dice mentioned, of which 25 publications were included in the present review. Between the selected studies, 20 are theoretical, 4 are case studies and 1
presents a study cross. There was a prevalence of publications in English, representing 84%, followed by the language Portuguese 9.6% and Spanish.

THE syncope is one condition only and has as pathophysiology The reduction of flow in blood at the space brain. This one restricted flow he can to be regional, through gives vasoconstriction or systemic due to hypotension. Due to the numerous etiologies, but for if the state of syncope is confirmed, there must be no causes of loss of consciousness such as a pseudosyncope, convulsive states and traumatic brain injury. Furthermore, for syncope occurs, an extension of at least 10 seconds of cessation is essential total blood flow or nutrient delivery, either to the cerebral cortex how much for O system in activation reticulate of trunk encephalic, or one reduction perfusional around 35% The 50% (CELESTINO, 2018).

Syncope is generally not a cause for alarm and is benign and may have several triggers what correspond The range age. O risk high in syncope in patients seniors, if he must mainly by abnormalities related The age and at illnesses what affect the ability to react to basal stress that under normal conditions do not would result at syncope. Furthermore, it is correlated The one exponential rate in recurrence, and it evolves according to the age group. Therefore, the most potential risk factor is already a previous episode occurred (NUNES, 2018).

Reflex, neuromediated or neurocardiogenic stimuli are the most seen across all age groups, causing vasovagal syncope, characterized by autonomic dysfunction, ephemeral and abrupt loss of consciousness, with full recovery, spontaneous and does not indicate any underlying disease, resulting from fear, anxiety or odors unwanted. Furthermore, as variance gives syncope vasovagal has O type situational which occurs by exacerbation of the reaction to vasovagal stimuli such as coughing, sneezing, urination, defecation, swallowing and eye pressure, leading to loss of consciousness (BRIGNOLE, 2020).

finds in hypersensitivity of breast carotid, occurs most in seniors, usually caused fur use in necklaces or ties tight, mobilization abrupt with the neck and the simple mobility of the neck results in loss of consciousness. That mechanism is rare and leads to bradycardia and reduced blood pressure resulting from exaggerated reaction From receivers located at the pair in carotid of neck what causes O electrical reflex brake cardiac action (NUNES, 2020).

The so-called case of orthostatic or postural hypotension is the abrupt decline of blood pressure in the orthostatic position, more common in the elderly, post-prandial, in situations in hypovolemia, sympathectomy, acts iatrogenic as The improper administration of drugs, involvement by nervous system dysfunction autonomous, correlation to some pathology such as diabetic neuropathy or idiopathic. Situation resulting from reduced venous return and non-compensation for reflection sympathetic autonomous (ROCHA, 2019).

Factors of cardiac origin represent 1% of cases in young patients, are closely associated with architectural failures of the heart such as aortic stenosis, valvular heart disease, atrial myxoma and acute myocardial infarction. Noting that despite being the rarest source of syncope, is consistent with the doubled
potential for mortality. Furthermore, the occurrence of arrhythmias, pulmonary embolism and heart failure congestive predisposes to development of this (CELESTINO, 2018).

The triggering of syncope certainly occurs with the association of several factors, such as medications that culminate in the reduction of blood pressure, due to the mechanism in vasodilation or hypovolemia, in special class in diuretics, O stimulation, volume depletion, exemplified by the occurrence of hemorrhage, inadequate fluid, diarrhea, emesis, pulmonary pathologies that lead to a shortage of oxygen cerebral and factors environmental as stress thermal (OAK, 2022).

Syncope episodes usually occur in the absence of symptoms of splurge, during physical exertion and in the supine position. Noting that cases of syncope from physical activity, it is essential to carry out the differential diagnosis of a classic triad, the approach of a tachycardia from ventricles, common the ischemia heart, The cardiomyopathy hypertrophic obstructive, The which compose potential cause in death fulminant in youth athletes and aortic retraction prevalent in the geriatric group (ROCK, 2021).

At pathologies cerebrovascular no are The cause base gives occurrence in syncope. At the however, The ischemia vertebrobasilar It is one potential etiology, per to be in charge for the watering the trunk brain, fur narrowing of carotid bilateral per consequent low overall flow and blood extravasation in the subarachnoid region (VELTEN, 2019). THE syncope no constitutes one emergency clinic, but O deficit in detection It is prevalent, required The Association gives story clinic, exam physicist and electrocardiogram. THE syncope usually to be in resolution own and fast, highlighting what The syncope cardiology generally entails prognosis with most complications. At the Emergency Room, to if admit a patient suspect in syncope, The conduct initial It is delete The cause heart. This one process he can to be done per quite gives analysis comparative gives syncope in origin heart or not. THE syncope heart affect with larger predominance O sex masculine, range age higher The 60 years old, heart diseases preexisting, historic familiar, tests cardiovascular changed and syncope during activities physical and at position supine. THE syncope in origin no heart attacks most you young people, without manifestation in pathologies heart, occurs most at position in orthostasis, triggers and recurrent (OAK, 2022).

To complement the clinical data obtained, regardless of the cause of syncope, an echocardiogram is requested, in addition to some indications such as recurrence, single episodes of physical injury, and diagnostic exclusion indicate O test gives slope, found in bases meteorological The effectiveness in tomography computerized, electroneuromyography and evaluation in dysautonomia and against in exams normal and absence of alterations can be considered the idiopathic cause event (OLIVEIRA, 2018).

3 CONCLUSION
In view of the collection of information, it can be concluded that syncope is a condition simple, common and what no It is considered one emergency clinic. At the comes, is fundamental a detailed
anamnesis, a thorough physical examination and the complementation with exams for if unravel The cause, O painting clinical, O diagnosis differential and the handling adequate.

CHAPTER 86

Perspective on Biotechnology Transfer in Brazil in ICT: a case of a “Spin-off” in the Brazilian Amazon Region

ABSTRACT

The origins of modern biotechnology date back to the sixties and early seventies in academic laboratories in the US and Europe. In these laboratories, the development of new biotechnological products emerged as a result of technological and scientific advances that used innovation and technology transfer in everyday research. In this context, it is clear that universities and research institutes have played a crucial role in the development of technological innovations, especially in the large area of biotechnology. Potential solutions to some of the global challenges faced by society are provided largely as a result of academic and laboratory research, whether by universities, "Spin-offs", research institutes and technology-based "Startups". This article aims to outline an overview of Science and Technology Institutions-ICTs and demonstrate the transfer of technology, through spin-off, in the area of biotechnology in the Amazon, aligned with the perspective of innovation in technologies and green patents. It analyzes the Science and Technology Legal Framework, which allows the use of resources to make innovative activities more flexible and the introduction of a new culture and advances in innovation in the Institution. It mentions the importance of the Amazon biome for the environmental health of the planet and the use of Intellectual Property, in the protection of the innovation of products and services generated in the research. Finally, it reports the case of a biotechnology spin-off in the adoption of practices favorable to sustainable technology and the search, learning and implementation of this technology for the market.

Keywords: Technology Transfer; Spin-off; Green Technology; ICTs; Innovation.

1 INTRODUCTION

Biotechnology is referred to as one of the enabling and key technologies of the 21st century, having the potential to offer, for example, solutions to health and resource-based problems facing the world, such as unmet medical needs and dependence on fossil fuels. Therefore, it is easy to understand that the relevance of biotechnology is even more unique if we consider that the modern biotechnology industry is only a quarter of a century old.
Another sensitive point in this discussion addresses the concept that the strategic practice of innovation is essential for research and for biotechnology-based companies. Such biotechnological innovations often have a higher level of innovation compared to other industries. Due to this relatively high level of innovation, there is greater uncertainty about whether these innovations will make it to the markets. A major difference lies in the fact that academic research is a crucial source of innovation for the biotechnology industry. Universities and research institutes have played a crucial role in the development of technological innovations. Innovation and technology transfer are effective for the development of biotechnology, as they provide potential solutions to some of the current challenges faced by global society.

The fantastic biodiversity of the Amazon arouses the interest of the entire world scientific community, in this way the Amazonian flora and fauna can create productive processes or even develop revolutionary substances for different applications. These processes must be aligned with the sustainability of the planet, so marked by the constant disrespect for the environment and biodiversity, already visible in climate change and consequent accidents in nature. In this sense, a more eloquent attitude of public policies becomes necessary, enforcing the existing laws, which defend biodiversity interests for the survival, with quality, of future generations, as well as the awareness of the importance of knowledge, coming from Universities and Federal Institutes, to conduct research with the development of new sustainable processes and products, which provide the technological transfer of a solution for society. The Institution of Science and Technology - ICTs, which include Universities and Federal Institutes of Education, Science and Technology - IFs, are no longer just generators of knowledge and basic research, but instead contribute with solutions for society, through of spin-offs, which we can conceptualize as nascent companies, based on technological research, which will be able to exploit this technology, generate intellectual property for the Institution and transfer the technology to society. And this was regulated by Law 13.242/2016, called Legal Framework for Innovation and Industrial Property Law No. 9.279, of 05.14.1996, which regulates rights and obligations related to industrial property.

Pinsky and Kruglianskas (2017) report that the concept of sustainability-oriented innovation is comprehensive and receives several denominations in the literature, such as sustainable, green, eco or environmental innovation. The research of the aforementioned authors considers the concept of eco-innovation, which was developed based on the Organization for Economic Cooperation and Development (OECD) definition of innovation.

In this sense, the spin-offs that work in the biotechnology area, mainly in the Amazon, can contribute with a research project, within the Universities or Federal Institutes, for the development of products with green technology and consequent protection of the product, through of green patents. For Santos et al (2017), green patents are patents focused on green technologies, that is, patents that relate to technologies that mitigate climate change, those that include reducing carbon emission and pollution, increasing energy efficiency and of resources and reducing the loss of biodiversity and ecosystems.
According to Richter (2014), green patents are important for the dissemination and use of new technology, as well as its effects on sustainability. The author states that the pilot program "Green Patents" was created in 2012 through Resolution PR 283/2012 of the National Institute of Industrial Property - INPI, in line with public policies related to combating climate change in the form of Law 12187/2009, which established the National Policy on Climate Change - PNMC. She also states that the advantage in the agility of granting green patents is the fact that their holders make the new technology available on the market also in less time than usual, considering the environmental appeal and the pressing need for new technologies.

Thus, it is important to consider which parameters contribute to the success of Science and Technology Institutions-ICTs that can generate spin-offs with green technology, to generate environmental sustainability, as well as the perspectives of protection and technology transfer arising from the development of biotechnological activities in the Amazon, thus constituting a valuable opportunity to understand this universe and its challenges.

2 PURPOSE

Demonstrate that Science and Technology Institutions-ICTs can generate spin-offs with green technology and the perspectives of protection and transfer of this technology, arising from the development of biotechnological activities in the Amazon.

3 METHODOLOGY

This article is structured under the exploratory and bibliographic method, developed based on a literature review, using secondary data. It contextualizes Amazonian biodiversity, presents the panorama of Science and Technology Institutions-ICTs, the Legal Framework for Innovation and the case of an academic spin-off in the area of biotechnology, generated in an ICT, and its motivation for the discovery of a product with green technology and the transfer of this technology to society.

4 THEORETICAL REVIEW

4.1 AMAZON BIODIVERSITY

The Amazon comprises one of the largest and most diverse biomes on the planet Figure 1) containing a rich biodiversity of fauna and flora with a high degree of endemism. In an area of almost four thousand km², it integrates eight Brazilian states and 125 federal conservation units (ICMBIO, 2021).
According to Franco (2013), in the scientific literature, the interchangeable terms biological diversity and biodiversity emerged to address issues related to the fundamental themes of ecology and evolutionary biology, related to the diversity of species and the environments that serve as their basis. Support, at the same time that they are supported by it and that are, at the same time, the stage and the result – always unfinished – of the evolutionary process.

The biodiversity of the Amazon, according to the MCTI (2021), is gigantic and this exceptional variety of life plays a fundamental role in the functioning of ecosystems and, ultimately, for human well-being. Its importance is recognized worldwide, occupying a prominent place in the international scenario. Unfortunately, threats to this rich biodiversity are growing. However, highlights MCTI, deforestation and forest fires have increased in recent years. Illegal logging always predominates over legal management. Hydroelectric plants and mining promote drastic socio-environmental changes. To top it off, climate change trumps all these problems. One of the main ones, emphasizes the MCTI, is the disruption of a web of biological processes and interactions essential for environmental and human health. For example, the reduction in the diversity of slow-growing trees leads to a lower capacity to absorb carbon from the atmosphere, contributing to worsening global climate change. The loss of biodiversity also compromises the potential for its sustainable use and prosperity for local and other populations around the world through the use of bioproducts in industries (MCTI, 2021).

However, when debating the role of ICT under the dynamics of globalization, it is imperative to make a critical assessment of current advances and challenges, but also of the ingrained dilemmas that lead to possible setbacks in research and the emergence of spin-offs, in order to propose sustainable solutions. Therefore, it is necessary to recognize that there is an immense demand to guide development with inclusion and reduction of social inequalities, expanding actions in the field of sustainability and socio-environmental responsibility.
4.2 SCIENCE AND TECHNOLOGY INSTITUTION-ICT AND THE LEGAL FRAMEWORK FOR INNOVATION

In contemporary debates, Chaves and Araújo (2020) point to the strategic relevance and commitment of Science, Technology and Innovation - ST&I to the establishment of innovation habitats as important bases for the development of society with sustainability. Still, in the authors’ view, the performance of Science and Technology Institutions-ICTs is perceived as strategic for advancing the process of society's development. However, this statement mixes a complexity of challenges and dilemmas for the generation of spin-offs.

13,243 /2016, regulated by Decree 9,283/2018 and called Legal Framework for Innovation (amends Law 10,973/2014), in its Art. with a view to technological training, the achievement of technological autonomy and the development of the country's national and regional production system, pursuant to arts. 23, 24, 167, 200, 213, 218, 219 and 219-A of the Federal Constitution.

Defines the Scientific, Technological and Innovation Institution (ICT) as a body or entity of the direct or indirect public administration or a non-profit legal entity governed by private law legally constituted under Brazilian law, with headquarters and jurisdiction in the country, which includes in its mission institutional or in its social or statutory objective basic or applied research of a scientific or technological nature or the development of new products, services or processes.

Among the permissions granted by the Legal Framework for Innovation, there are:

- Promotion of cooperation and interaction between public entities, between the public and private sectors and between companies;
- Stimulation of innovation activity in Scientific, Technological and Innovation Institutions (ICTs) and in companies, including for the attraction, constitution and installation of research, development and innovation centers and technology parks and poles in the country;
- Encouraging the creation of favorable environments for innovation and technology transfer activities;
- Promotion and continuity of scientific and technological training and qualification processes;

In this universe, points out SEBRAE (2022), the approved law seeks to encourage the development of the sector through three main axes: it allows the integration of private companies into the public research system; the simplification of administrative, personnel and financial processes in public research institutions and the decentralization of the promotion of the development of ST&I sectors in the States and Municipalities. stands out to be It is important to note that the changes brought by Law No. 13,243/2016 have the potential to integrate research, the market and the public sector, and also to transform the scientific knowledge produced in the country into innovative products and services for society.

Corroborating the previous statements, Goulart (2022), in a recent lecture at INPA, explained that the Brazilian Legal Framework allows for a series of flexible measures for innovation and spin-off development, but the internalization of these measures in the university is complex, given that the autonomy they have and the non-use of the solutions mentioned. He explains that in other countries universities are
partners in spin-offs, receiving royalties, but these opportunities, allowed by the Legal Framework, are not absorbed by universities. It explains that the R&D must be validated by regulatory agencies and form strategic partnerships to achieve scalability or license the technology to be commercialized and obtain product certification.

Therefore, in this sense, ICTs still have the possibility of implementing business incubators (to support spin-off and startup management) and Technological Innovation Centers (NIT), to support the Innovation and Intellectual Property policy at the Institution, among other areas, biotechnology, with a focus on environmental sustainability.

4.3 ABOUT ECO-INNOVATION / GREEN TECHNOLOGY / GREEN PATENT

Green technology starts from a concept that seeks to determine a sustainable production process, applying good techniques in order to cause less possible impact on the environment. Eco-innovation, according to Schneider (2020), is part of a sustainable and innovation-based development process. The author mentions that eco-innovation is closely linked to a variety of related concepts, such as eco-efficiency, ecological design and sustainable design. Therefore, it is possible to verify the existence of gaps between each of these concepts, as well as, such gaps could and should be filled to unify them in a single movement strong enough to create a new trend/ ecological order, both in the technological dimension and in the social dimension, whose priority is sustainable development. On the other hand, Schneider (2020) states that eco-innovation represents a fundamental opportunity to overcome global sustainability challenges and a business opportunity that can make the Brazilian economy even stronger and more competitive in the future, as it is a new business approach that promotes sustainability over a long period of time, the entire life cycle of a product, in addition to increasing the company's performance and competitiveness. A new management approach to sustainability.

In this trend, the “Green Patents” program, promoted in Brazil by the National Institute of Industrial Property (INPI-BR), has as main objective to gather and accelerate the examination of patent applications that contemplate innovations related to the environment and at the same time identify new technologies for sustainable development, on the other hand, makes it possible to obtain a letter patent with a reduction of up to 90% of the normal examination period (RICHTER, 2014). This measure encourages researchers to seek protection for their innovative technologies.

For Santos and Martinez (2021), although the process of development, diffusion and implementation of green technologies is complex and multidisciplinary, one thing is clear: a fundamental first step in the process of green innovation is taken when the available green technologies are known, followed by the identification of the main actors in this large “cluster”. Thus, the authors clarify that with the provision of such knowledge about Industrial Property, scientists, engineers, policy makers and industry stakeholders can plan more effectively research and development activities for environmentally sound
technologies (EST’s), forging strategic partnerships and delivering more effective technology transfers as needed.

According to Santos and Martinez (2021), much information currently available in the world about new green technologies can only be found by reading patent documents. They also state that since the 1970s, many scientists and researchers, entrepreneurs and industrialists, have discussed side by side with heads of state in a major world conference organized by the United Nations (UN) to address issues related to environmental degradation, as well as how to point out real alternatives on how to improve man’s relations with the Environment. For Fanhaimpork et al (2022), describing and defining these green technologies constitutes a challenge for anyone seeking to file a patent application.

Currently, the Sustainable Development Goals (SDGs) propose the 2030 Agenda for global development for the next 9 years, but there is still much to discuss about the real actions that are being carried out to improve the life of the planet and allow a healthy world for the next generations. According to the SDGs, the 17 Goals based on 169 goals are the steps identified to guarantee a fairer, more dignified, more inclusive and sustainable world where it proposes the eradication of poverty and hunger to gender equality and quality health, from clean water and sanitation to decent work and economic growth, from reducing inequalities to quality education, from renewable energy to climate action. This agenda reflects the balance between the following 05 (five) principles: (i) people; (ii) planet; (iii) peace; (iv) partnerships; and, (v) prosperity that are presented as pillars of this global strategy.

4.4 BIOTECHNOLOGY SPIN-OFF

Biotechnology can be understood as the application of science and technology to living organisms, as well as their parts, products and models, to alter living or non-living materials with a focus on generating knowledge, goods and services. And in this context, Bioeconomy focuses on putting into practice biotechnological applications in the set of economic activities of production, promotion of production, distribution and consumption of goods and services from socio-biodiversity resources (SECTI-SEDECTI, 2022).

According to CNI (2013), Bioeconomy emerges as a result of a revolution of applied innovations in the field of biological sciences. It is directly linked to the invention, development and use of biological products and processes in the areas of human health, agricultural and livestock productivity, as well as biotechnology.

- offs are companies generated from a research project developed within universities or Federal Institutes. According to Amaral (2021), they have information difficulties in the area of business management, from the development of marketing plans, strategic partnerships, sales and financial management, since most managers of this type of company come from academia and do not have training or experience in business management.
Biotechnology is a relatively new area and the entrepreneur, in general, is a researcher, who concentrates the main source of information within the institution as a university project and the information he has is strongly located in knowledge and technology involved in the development of the product, scientific research results. However, for Amaral (2021) The biggest challenge for biotechnology companies is to transform their business into a business model that is efficient and is an interface between the technology developed and the creation of economic value. Taking this statement into account, one observes the difficulty of a spin-off in transferring its technology to society and many open their own businesses, when possible.

Therefore, spin-offs that work in the area of biotechnology, especially those that operate in the Amazon, have an enormous possibility of generating innovation with a focus on sustainable technology for the transfer of this technology to society and the subsistence of future generations with quality of life. It is important to recognize the central role of academies, notes Chaves and Araújo (2020) as producers and depositories of knowledge and trainer of technical skills, and this training points out Lasmar (2005), refers to the accumulation of knowledge and skills by individuals and organizations, from learning processes. In this aspect, the importance of the knowledge generated by the ICT for the creation of spin-offs is fundamental. The more knowledge is involved in the design of products and services, the greater their value in the market and the consequent added value of innovation in the company.

However, in the trajectory of the entrepreneurial vocation, Kupor (2019) observes that the most important thing for an entrepreneur, even with hard work and daily difficulties, is to maintain the hope of achieving success.

It was reported by Professor Ernesto Goulart, researcher at the Center for the Study of Human Genome and Stem Cells at USP, São Paulo-SP, at the “4th International Conference on Innovative Processes in the Amazon” “Academic Spin-off” (Palestra), at the Institute of Pesquisas da Amazônia-INPA, in Manaus-AM, June 14, 2022, that the research journey in search of something promising, innovative, until it becomes a marketable product is a challenge in Universities, as there are also problems and peculiarities of the innovation process in Brazil, since it has large amounts of patents deposited, but in the 57th position in the world innovation rank. It mentions that the patent application is not an indicator of innovation, as this indicator is measured by Technology Transfer-TT, which in Brazil are limited. He explains that this situation occurs because the innovation process in Science and Technology Institutions-ICTs is closed, inside the institution and with the imposition of limits and restrictions on its internal intellectual capital. It explains that spin-off has to think about intellectual property-IP every day, with everything mapped, to avoid failure, being extremely important to delve into this theme.

For Carayannis et al. (2012), the development of an innovation must take into account the pluralism of sources of knowledge, such as traditional knowledge that comes from the practices and modus vivendi of traditional populations composed of quilombolas, riverine people, various indigenous ethnicities, among
others, whose main characteristics are orality and ancestry that provide important information for research and production of scientific knowledge.

In this context, the production of specialized knowledge, the production of social technologies, the increment of innovative inputs, products and services represents a field and a domain that has only just begun its pioneering in the region (CHAVES, 2012).

Thus, from this perspective, new horizons, new contours, contents and forms emerge, gaining scope and expectations of generating spin-off in biotechnology, protecting this technology and transferring it to society. It remains clear that there is a need for effort to expand the implementation of innovation practices, arising from technological research in biotechnology, through spin-off and its access to the market.

5 AMAZÔNICA SPIN-OFF CASE: PORÃ PRODUCTS DA AMAZÔNIA

The study carried out by the Center for Orchestration of Innovations COI (2022), points out that the five main scientific areas that appeared for the total of 1070 publications found in the search, according to the classification by categories of the Web of Science, were: plant sciences; environmental Sciences; food science and technology; ecology and molecular biochemistry. The following case used some of the areas cited by the IOC. The study results from the experience report presented by an IFAM researcher and co-author of the work.

Porã Produtos da Amazônia is a spin off originated from the Federal Institute of Education, Science and Technology of Amazonas-IFAM, founded in 2017, with the objective of bringing to the market a technological innovation differential associated with the phytopharmaceuticals, cosmetics and functional foods segment, based on the benefits arising from the inclusion in their products of essential oils found in plants from the biodiversity of the Amazon. These benefits consist of offering the market products without preservatives, without added sugar, without lactose, thus providing an improvement in the quality of life and that benefit the body, in addition, functional foods help to slow down the evolution of diseases such as diabetes or cancer. In addition, they also help to mitigate health problems, such as intestinal constipation, contributing with their bioactive compounds, which have proven activity in various types of treatments, also improving physical conditioning.

5.1 HISTORY

The idea arose when an IFAM researcher discovered that the diagnosis of hypothyroidism and type 2 diabetes and the need for people with this type of disease not to have adequate and tasty food to minimize the effects of diets prescribed by nutritionists, always with a routine and proposal for food reeducation, in a lifestyle change. The products on the market were horrible and unpleasant for the consumption of those who are under this type of treatment.
From there, he started to make some simple recipes at home and take them to be tasted in the department of the Department of Chemistry, Food and Environment - DQA, of IFAM, aiming to find a solution that would benefit this public.

5.2 DISCOVERING THE BENEFITS OF BIODIVERSITY

The tasting of differentiated recipes was well accepted at the Institution and from that moment on, the idea arose of starting research in the Food Laboratory of the Specialization in Food Technology course, where he had the opportunity to learn and discover the universe of the world of plants and their essences or rather their essential oils.

In 2015, I was already aware that products for people being treated for chronic diseases, such as diabetes (they had an inflamed body and altered taste due to the pathology), so it was necessary that there were products on the market that had taste, appearance and, mainly, were absent from preservatives, which could contribute to acting on energy deficits suffered by these people, in addition to providing therapeutic food comfort.

The first research came from the specialization with *Ocium gratissium essential oil* in tambaqui meatballs, under the guidance of two researchers from IFAM.

In the meantime, he started courses on Bakery with the use of Non-Conventional Food Plants (PANC), as well as research on the reuse of malt bagasse and brewer's yeast, originated from the production of artisanal pineapple beer by two more IFAM researchers, contributing with the reuse of malt.

The research at IFAM ended up interacting in a way that the waste was always used, so much so that in 2015 the idea of research for the production of flour from fruits, seeds, tubers, originating from the Amazonian biodiversity, always with the environmental awareness of the production of closed cycle, that is, total reuse of food, taking all the usual care of food safety and sanitary control, collaborating with sustainability.

The first breads were prepared and tested, based on the nutritional balance of each fruit, seed or tuber of açaí, aracá-boi, peach palm, bacaba, cupuaçu (pulp and almond), purple yam, gizzard yam, Brazil nut, babassu nuts, manioc, pequi, piquiá, uixi, camu-camu, acerola, buriti, among others, which are Amazonian plants and fruits, with some of the results presented as shown in figures 1 to 4.
The development team was formed by highly specialized professionals, in several knowledge segments (Bioprocesses, Design, Logistics, Information Technology and Process Management), due to the scope of the enterprise involving a complex context of activities, such as: Extractivism, agronomy family, training of manpower and Chemistry, with a view to serving both the national and international market. This provides a value chain for the product of Amazonian biodiversity. The spin-off, derived from research carried out at the IFAM Food Technology Laboratory and using green technology, has 5 types of gluten-free flour mix for breads, cakes and cookies, all with functional taste action and pleasant and different appearance. The company produces its own banana peel-based yeast, which in the absence of raw material from craft brewery waste (yeast and malt bagasse) meets current demand. Figures 05 and 06 show more products manufactured from green technology.
In particular, the spin-off presents innovation routes since its conception, since the raw materials have characteristics that allow the development of a huge range of products, with different applications, until then little or nothing presented to the consumer market. Finally, another important aspect deals with the business model, which is premised on preserving the forest, sustainable development and valuing the culture of traditional peoples.

5.3 THE TECHNOLOGY

The project aimed to identify biopharmacological substances from the extracts of plants: Alfavaca (Ocimum basilicum), Crajiru (Arrabidaea chica) and (Curcuma) curcuma longa L, as well as to produce an ethanolic extract, with a certain concentration and to test antibacterial activity using culture, for the growth of gram-positive and gram-negative bacteria. The dry extract was also produced, from the maceration and drying of leaves, rhizomes and branches, for drying in an oven and subsequent crushing. After the extraction and purification of essential oils, the purified substances are engineered through Spray Dryer and nano encapsulation processes, for use in bioproducts (Phytotherapics, cosmetics and functional foods).

In conclusion, the company is studying an outsourcing strategy, establishing partnerships with companies in the scientific, industrial and commercial segments to enable a greater number of product options, thus making it possible to expand its operations in the phytopharmaceuticals, functional foods and cosmetics market and providing the technology protection, through the Technological Innovation Nucleus-NIT.

6 FINAL CONSIDERATIONS

This study sought to demonstrate that Science and Technology Institutions-ICTs can generate spin-offs with green technology, transfer this technology from biotechnological activities. It is understood that the dialogue between academia and researchers can create possibilities to promote various actions that can contribute to sustainable development and combat threats to this rich biodiversity. The ICT has a whole legal framework to start a support process in the creation of spin-offs, protect the product and transfer the
technology, it is enough to internalize Law 13.243/2016, in order to socialize its knowledge and transform it into an innovative and sustainable solution for society, as well as the Industrial Property Law No. 9.279, of 05.14.1996, which regulates rights and obligations related to industrial property. The case of Porã Produtos da Amazônia, a spin-off generated in IFAM laboratories using green technology, is an example of how the knowledge provided by Universities and Federal Institutes can contribute to the future of the planet.

The benefit of accelerating the examination of patent applications, which contemplate innovations related to the environment, enabling agility in granting green patents at the INPI, should encourage the application for the filing of patents arising from green technologies and collaborate for innovations in the market. Thus, the feasibility of investing in spin-offs in the bio-business area, contributing to the health of the planet, makes it possible to see a future of opportunities that must be taken advantage of in the Amazon region. There is immense potential for the production, processing, commercialization and consumption of products from biodiversity, which generates expectations to develop solutions to stimulate the production chain and the development of the Amazon Region, which serves to strengthen the path of development with social inclusion from the perspective of sustainability and respect for the environment. Therefore, these opportunities can be used to strengthen applied research and technology transfer from ICT to society, generating innovations.

One can also prove the possibility of creating a spin-off in ICT, through the case of Porã Produtos da Amazônia, which from a public need met a great demand, using biodiversity to create innovative products with green technology, developing a value chain. It is worth mentioning that the spin-off was supported by the AYTY-Incubator of Companies of the IFAM, in several capacities, from understanding its Business Model (CANVAS) to the elaboration of its Business Plan.

Therefore, it is evident the importance that knowledge has in promoting entrepreneurship, in this way, it becomes necessary for Educational Institutions (ICTs) to use available resources to present solutions and generate biotechnology spin-offs. This means a new procedure and a new culture at all levels of the Institution. Furthermore, in Brazil, especially in the Amazon, which is rich in biodiversity, research seeds are already sprouting in the ICT scientific community, mainly in green technologies. There is a strong coexistence with traditional communities and the appeal of forest preservation is evident, as it directly affects the future of the next generations.

The spin-off can still count on the support of the NIT, for the due protection of its creation, at the National Institute of Industrial Property-INPI. You can also count on the support of a business incubator to support your journey to market. Therefore, the prospects for research in ICTs to transform themselves into innovative and sustainable products, through a biotechnology spin-off, among other areas, are in place, it is enough to be practiced, as the legal framework, through the Legal Framework for Innovation and demands are made.

ABSTRACT
OBJECTIVE: To evaluate the epidemiological-clinical profile of patients affected by acute febrile illness in a city in northeastern Brazil.
METHODOLOGY: Descriptive, cross-sectional retrospective study with patients infected by DENV in the city of Picos-PI. The collection was provided by an employee of the epidemiological surveillance center of the Municipal Health Department of the municipality. Data was extracted by the Notification System for Notifiable Aggravations - Online (SINAN-online) in the years 2020 and 2021.
RESULT: In the studied period, 442 cases of dengue were reported. With the emphasis on the female population (in 2020), and a prevalence of the white population (50%, in 2020) and mixed race (72%, in 2021), most of the diagnosed patients had the 1st to 4th incomplete grade of elementary school (4.23%).
CONCLUSION: It was found that there was a drop in the number of notifications in the period studied, due to the COVID-19 pandemic in 2020 and 2021. The present study used a secondary source of information from the public health service, which makes it susceptible to inconsistencies, and further studies on the subject may be necessary.

Keywords: Dengue; Epidemiological Profile; arboviruses

1 INTRODUCTION

Dengue is an arbovirus, caused by the DENV virus, an RNA virus that belongs to the Flaviviridae family, of the Flavivirus genus, has four known serotypes (DENV 1; DENV 2; DENV 3; DENV 4), which are antigenically distinct, however serologically associated, and cause a systemic, febrile and acute disease, with a wide spectrum of symptoms (GUEDES; ROCHA, 2019).

Its transmission occurs by the bite of female mosquitoes of the species, to a lesser extent, Aedes albopictus and Aedes aegypti, the latter being the vector responsible for transmission in Brazil. After inoculation, the virus undergoes an incubation period of 4 to 10 days in humans, until the appearance of the first symptoms, which are generally debilitating but self-limiting, since most patients have a benign course, evolving with remission of symptoms and recovery, however a part of patients can progress to severe forms, including death (BRASIL, 2009).

The disease has three clinical phases: febrile, critical and recovery. The first manifestation of the febrile phase is high fever (39°C to 40°C), with an abrupt onset, associated with headache, adynamia, myalgias, arthralgias and retro-orbital pain. There may also be a rash with or without pruritus, anorexia, nausea, vomiting and non-voluminous diarrhea, in general most patients recover gradually and return to daily life (BRASIL, 2016).
The critical phase may be present in some patients and begins with the defervescence of fever, between the third and seventh day of the onset of the disease, accompanied by the emergence of alarm signs, which indicate a worsening of the clinical condition and can lead the patient to death, reason for the adoption of different measures of clinical management and observation in these cases. In the third and final phase, recovery, there is an improvement in the general condition of the patient, a reduction in symptoms and hemodynamic stabilization (BRASIL, 2016).

Currently being one of the most important arboviruses in Brazil and in the world, dengue has a high incidence in tropical and underdeveloped countries, whose environmental conditions favor the proliferation of the mosquito, due to its climatic, environmental and social characteristics (WHO, 2022). Transmission in Brazil started at the end of the 19th century, the first known case occurred in the city of Curitiba - PR, with the first clinical and laboratory notification only in 1981 in Boa Vista - RR with the isolation of DEN - 1 and DEN - 4 serotypes (FIOCRUZ). Since its introduction, the virus has been a major national concern, causing epidemics in all Brazilian regions.

The emerging condition, categorized as the main arbovirus disease known in the country, is consolidated in an epidemic situation, as shown by data published in the epidemiological bulletin for the 2020s (979,764 cases, incidence of 466.2 cases per 100,000 inhabitants) and 2021. (534,743 cases, incidence of 250.7 cases per 100,000 inhabitants), where the Midwest region led the ranking in the two referred years with 1,200 cases per 100,000 inhabitants in 2020 and 616.8 cases per 100,000 inhabitants in 2021, in the first year, the Northeast region ranked 4th with 261.5 cases per 100,000 inhabitants and 2nd place in 2021 with 115.4 cases per 100,000 inhabitants. Such data confirm the Northeast region as one of the main areas affected by arboviruses.

In view of the above, it is pertinent to seek and characterize the most affected population and draw a clinical-epidemiological profile of the disease in the region, which is still poorly studied. Such knowledge will facilitate the identification of adequate preventive and therapeutic measures that must be implemented to meet the population defined as a risk and thus provide a better quality of life and health for them. Therefore, the general objective of the study was to verify the epidemiological-clinical profile of patients affected by acute febrile illness in a city in northeastern Brazil, describing its distribution and general characteristics of the cases.

2 METHODOLOGY:

The study is descriptive, cross-sectional retrospective, with patients infected by DENV, in the city of Picos - PI. Located in the central-south region, the city has 577,284 km², a hot/dry climate and is considered a strong commercial hub and a reference in the macro-region. The population is 78,627 inhabitants, with an estimated population density of 137.30 inhab/km² (IBGE, 2021).
The data were extracted by an employee of the Epidemiological Surveillance Center of the Municipal Health Department of the municipality, secondary data, consisting of identification data and classification items from the records, based on the SINAN’s own dengue and chikungunya investigation form, these forms they are standardized and incorporate relevant data about the disease, the affected patient, clinical and laboratory information, as well as alarm signals and important complementary information. Of the dengue and chikungunya cases, only confirmed dengue cases were considered, by clinical-epidemiological and laboratory criteria (Hilab Remote Laboratory Test of Dengue NS1 and by IgM serology), notified in the Information System of Notifiable Diseases-Online (SINAN-Online), from January/2020 to December/2021 in Picos-Piauí.

The incidence coefficient (CI) of dengue was calculated per 1,000 inhabitants, using the population residing in Picos in the last year of 2021 as the denominator, according to data available from the SUS Department of Informatics (BRASIL, 2022).

Then the information provided was tabulated in Microsoft Excel spreadsheets (2019), from which it was possible to build tables and graphs to clearly demonstrate the municipal epidemiological situation regarding the theme.

All research followed the rules established by Resolution No. 466/2012 of the National Health Council.

3 RESULTS:

Of the total measured in the sample, 72 suspected cases of dengue were reported in 2020, of these 14 were confirmed, in 2021, 370 cases were reported and that year 297 were confirmed. In the two years surveyed, the female population was the most affected, leading, in the first year, 10 of the 14 diagnosed cases; in the following year with 174 cases (51 cases more than the male population), as shown in image 1. Of the total number of confirmed cases in both years, only 08 pregnant women were affected, all in 2021.
In 2020, the white population occupied 50% of the diagnoses, followed by the brown color (36%), in the following year the brown population led the ranking with 72%, followed by the white population (24%), in terms of education, in 2020 the most of the diagnosed patients had incomplete 1st to 4th grade of elementary school (4.23%), as shown in table 1.

The cases were confirmed by laboratory and clinical epidemiological criteria, with IgM serology being the most used of the laboratory tests, of those confirmed, all evolved to cure; in 2020, 2 hospitalizations were reported, in 2021 the number increased to 34, with a greater number of dengue with warning signs and 3 cases of severe disease, as shown in table 1.
TABLE 1: Characteristics of dengue cases reported in the city of Picos-PI in the years 2020 and 2021.

The individuals analyzed in consecutive years (2020 and 2021) obtained, after clinical evaluation, the following classification of symptoms:

Figure 2: Main symptoms of dengue in 2020-2021

Fever
Myalgia
Cephalalgia
Rash
Vomit
Nausea
Backache
Conjunctivitis
Arthritis
Arthralgia
Petechia
Leukopenia
Tourniquet test
Retro-orbital pain

4 DISCUSSION

Between 2019 and 2020, dengue proved to be a disease with very striking characteristics, it predominated in the Midwest region, with 920.4 cases/100,000 inhabitants, which concentrates the main urban centers in Brazil with Goiânia. and Brasília occupying the top of the ranking in number of cases, reinforcing the theory that the mosquito that transmits the disease has a preference for urban environments, which has a welcoming sociodemographic structure for its reproduction, with poor sanitation in areas of social vulnerability and tropical climate, increasing its reproduction and consequently the number of infections (BRASIL, 2020).

The Northeast is in third place with 261.5 cases/100 thousand inhabitants, with a semi-arid climate and prevalence of a less favored economic class with low education, which already has a greater propensity to spread dengue cases, due to the lack of adequate water drainage, common in areas of poverty. This
situation is confirmed on a chronological scale, considering that between 2008 and 2017 there were 963,862 deaths, second only to the Southeast region (NORÓES et al., 2021).

When analyzing the notifications of dengue cases in the year 2020 and 2021 in the city of Picos, there was a significant increase between the years (difference of 283 cases). Analogous to these data, the Ministry of Health presented in its epidemiological bulletin a unanimous decrease across the country, where there was a drop in probable cases of dengue in 2020 compared to 2019 (Brasil, 2020). This decline can be explained by the expansion of actions aimed at fighting Covid-19, which caused the delay in the underreporting of arboviruses, by the lower demand for health services due to the fear of the infectivity of the SARS-Cov-2 virus, or even even due to the clinical similarity with some of the symptoms of dengue and Covid, which may have made it difficult to close the diagnosis (DE SOUSA et al., 2022).

Regarding sociodemographic conditions, in relation to sex, a remarkable prevalence of the female public was observed, representing more than half of the cases in 2020 and surpassing the male sex in 2021, a result compatible with other northeastern states in different years, as in Maranhão, where women accounted for 65% of cases of dengue infection in the state (2017) and in the state of Ceará, which had a higher proportion of women with the disease, with a variation of 5% to 10% more female cases with dengue between 2017 and 2020. However, in 2013 and 2015, the State of Bahia observed an inversion in this pattern, where the highest prevalence of dengue infectivity occurred in males (COSTA et. al, 2019). & VERA et.al, 2020.

The supposed predilection for women may be related to the frequency of this public in a peridomiciliary environment, where the outbreaks are more commonly found, and also to the greater demand of this public for health services, making the diagnosis more frequent and easier compared to the male population that presents greater resistance to this search. However, dengue is not directly related to sex, and for this reason there may be differences in results with other studies (COSTA et.al, 2019 & VERA et.al, 2020)

As for the variable referring to the number of pregnant women affected by dengue, the municipality of Piauí reported only 08 cases of dengue in pregnant women in the years 2020 and 2021, representing only 2.57% of the total confirmed cases in the two years. birth et. al., 2017 notes the occurrence of more than 40,000 confirmations of dengue diagnoses in pregnant women in Brazil between 2007 and 2015, also stating that in that period the lethality of pregnant women with arbovirus exceeded the number of deaths of women in non-pregnant childbearing age, also classifying the third trimester as the one with the highest risk of complications such as preeclampsia, eclampsia, hemorrhage and maternal death. In reference to cases confirmed by clinical criteria, in pregnant women, the risk of death increases by three times; being eight times higher in the case of laboratory confirmed cases (Fiocruz, 2018).

There is a prevalence of dengue cases in the mixed-race and white population. In agreement with Oliveira et. al., 2020, which points out the races mentioned above as the majority in the diagnoses of acute febrile illness in the State of Maranhão. Also in agreement with the results of the research carried out by
the authors, in the Northeast region, between January 2008 and December 2017, the mixed race remains the most affected by acute febrile illness, with about 14.3 million diagnosed in that same period. time interval, the white race was the second most affected, with 2.2 million confirmed cases (Norões et al., 2020). According to Pereira et. al., 2008 – the greater involvement of whites and browns can be explained by the fact that they are more susceptible to illness by the flavivirus under study, with blacks being more resistant to the installation of the virus and the development of the pathology.

The clinical presentation of dengue symptoms is variable, however, there is a consistent line of thought among researchers, that the first symptom to manifest is a fever above 39°C with an abrupt onset and the presence of a macula-papular rash in the region. of the trunk. These are the classic symptoms for the early identification and treatment of dengue. In classic dengue, the importance of recognizing the symptoms and signs that point to an evolution of the disease is also emphasized, these are abdominal pain, hypothermia of sudden onset between the third and seventh day and the reduction in the level of consciousness.

As for education, the data denoted the prevalence in people who have an education level from the 1st to the 4th year of incomplete elementary school and complete high school, this result may be related to the reduced knowledge regarding prevention and care with dengue, considering that the lower the level of education of a population, the less knowledge about the aspects of the disease (CUNHA, 2012). In addition, a considerable percentage was presented in the municipality of Picos in the following categories: Not applicable (29% and 6.60%) and ignored (7% and 17%), in 2020 and 2021 respectively, a result also evidenced in a study carried out in the State of Pernambuco, representing 68.9% of blank or ignored fills (2015 – 2020). (DE LIMA FILHO et.al, 2022). This non-completion makes it difficult to delineate this variable, since this notification can improve the understanding of the epidemiological profile to promote disease prevention and control measures. This point demonstrates a necessary agenda for the discussion of health professionals and managers (VERA et.al, 2020).

5 FINAL CONSIDERATIONS

Considering the epidemiology of dengue in Brazil in recent years, and the drop in the number of notifications for dengue in 2020 and 2021, the hypothesis of a possible underreporting of dengue cases due to the COVID-19 pandemic is raised. In addition, the actions of dengue control programs during the period carried out in the region should be analyzed. Both variables are important for a more concrete assessment related to the decrease in dengue cases.

Furthermore, it is noteworthy that the present study had as a source of information, secondary data from the public health service, susceptible to inconsistencies, requiring further studies on the subject to assess possible divergences.

ABSTRACT
This work describes the implantation of free geo technologies, using free and open-source software, to disseminate the geospatial information of the Bahia Water and Sanitation Company (EMBASA). EMBASA is the concessionaire responsible for basic sanitation in the State of Bahia. This article also describes, besides implantation, an analysis of the saved costs by the company over the years.

Keywords: geotechnologies, free software, basic sanitation.

1 INTRODUCTION

Geotechnology is a type of information technology, which works with data geographic and technologies correlated with This one type in given away. Among at geotechnologies, the Geographic Information Systems (GIS), the in management in banks in Data Geographical (SGBD), O Global Positioning System (GPS), the Georadar and the orthophotos (Aragon & Campos, 2009).

Lately, at geotechnologies has awakened much interest of companies, what manage infrastructure. This is because they allow the manipulation of information spaces aimed at tackling complex demands that involve geographic coordinates (Martin, 2019) (Aragon, 2020).

In the context of geotechnologies, GIS stands out. This special type of system of information allows the spatial view of the information associated with the databases geographic. A GIS can be applied in several analyzes contemplating demands operational, tactics and strategic (CHAMBER, 1996).

Despite the known benefits from a GIS implementation, the The implementation process of this type of system involves high costs of licensing software , demanding of organizations to need in hiring in consulting specialized services (Aragon, 2020). As a result, few companies are able to implement a GIS in set with your area of technology gives information. Aiming mitigate you high costs in licensing, one alternative It is O use and adoption in software free (SOFTWARE FREE, 2022).
it is understood per software free, all program in computer what allows O your use unrestricted. O software free he must to allow, also, what O your code source be open. This one type in software, generally, It is sustained per several developers scattered in several countries (Aragon & fields, 2009) (Martin, 2019).

In this context, this article describes the implementation of free geotechnologies, in in particular, GIS and DBMS based on free and open software allowing the company save on software license costs. This article describes the process of implantation in one company of sanitation basic of state gives Bahia in Brazil.

2 MATERIALS AND METHODS

In the first phase of the project, a survey was carried out on which best free, open and free technologies that were available and with a community active. Have a community of developers keeping the project free software active and up-to-date is something fundamental for the choice. In this research, priority was given to software that did not require licensing costs (FREE SOFTWARE, 2022) (DAVIS, 2007). This was a criterion established for the implementation of geotechnologies in the projects of the company EMBASA, which was used as a case study of this job. Therefore, technologies what, although free, demanded any value for use were 2.1 DISCARDED.

Among the technologies studied, the GeoMoose environment was adopted with the MapServer map server, QGIS and the PostGIS Database (GEOMOOSE, 2022) (QGIS, 2022). It was noticed what these technologies are free, open, without costcom license and robust. It was observed with the research, that they are used in several large companies, especially QGIS (ARAGÃO and CAMPOS, 2009) (Martin, 2019). Finally, the costs of licenses of proprietary software were surveyed aiming estimate the value saved by the company to to adopt software free.

3 RESULTS

The adoption of free software for the implantation of geotechnologies in the EMBASA made the geographic data more accessible per a larger number of users (EMBASA, 2022). It is implementation allowed democratizing the use in systems in information geographic arriving The users experts and no experts. At gestures commercial and operational, for example, have been improved. These will be described below. improvements.

Company managers can use geographic data in the geographic information to visualize consumers and their correlated data. Consumers can be spatially grouped according to their type (residential, industrial or large consumer). This can be arranged in the form of thematic maps, that allow the use in Colors aiming to filter spatially the consumers.
Figure 1 shows an example of a thematic map. In this figure, the user can view the inhabited, under construction, uninhabited properties, among others, according to the legend that can also be seen in Figure 1. In this way, it is possible to perceive concentration of inhabited properties in certain parts of the city and prioritize the supply in these regions. As a background on the map, you can view the orthophotos of County, this It is, images georeferenced, O what check larger wealth in detail in analysis geographic.

Figure 1: view of a thematic map from properties

UMF property Situation
Habitated
Construction
Inhabited
Ceased Construction
Demolished
Temporary Occupation
Ruins.
Terrain

Figure 2 shows the same map as Figure 1, but with an operational view. In Figure 2, the drinking water distribution networks can be visualized in blue. In addition Furthermore, by clicking on each line in blue, the user will be able to access operational data of networks of water supply as diameter, material and extension.
Figures 1 and 2 show the GIS screens based on free geotechnologies and free. No there was none cost with O licensing of software for O development of these systems. Two examples of use can be seen that allow better management commercial and company operating.

Geotechnologies help managers in decision making. they can do analysis spatial complex involving questions as: Where they are concentrates my consumers? Where is my water supply network infrastructure and sanitary sewage? The use of a GIS tool is essential to respond to questions like these. Tabular data without an associated spatial view is not enough to answer The these questions, that involve the aspect geographical.

Currently, the geographic information systems implemented at EMBASA have 1706 registered users, which represent almost 40% of the employees of company (Figure 3). Therefore, The company allows what 1706 users use at geotechnologies without any costs with license in software .

Figure 3 – Screen of the system that controls the number of users of EMBASA’s geotechnologies.

If the company wants to add new users over time and meet all The force in job gives company, no there is none off-side, then all at technologies are based free. Therefore, it is concluded that the adoption of free software allows to the project be scalable.
For it is made comparative, case were adopted a software owner, what has a cost in lathe in 100 dollars to year, per license, this it is, per user, the company it would have what deal with a cost of approx. 170,600 dollars per annum. The project is implemented since 2007 and the projection of the economy is of 2,559,000 dollars during these years old. This value saved he can to be directed for the update of park technological, as well as for others demands of the area in technology.

3 CONCLUSIONS

The implantation of geotechnologies described in this article allowed the development of geotechnological solutions that serve users without adding costs for the company. It is worth noting that the technologies described in this article were based on software free, open and free.

It is concluded that, as it is based on free and free technologies, the project enabled significant savings for the company. Furthermore, these technologies can be personalized for others contexts, making the project scalable from a technical and functional point of view. The following future work is pointed out: the realization analysis to study whether the technologies described in this article allow the expansion of functionalities without adding complexity in development.

ABSTRACT
The objective of this article is to carry out a critical analysis of the information management process based on the case of the “Brazilian terrorists”, which took place in parallel with the preparations for the Rio 2016 Olympic Games. The article aims to analyze the conduct of Brazilian authorities to protect their interests without affecting the relationship of trust with society, mainly through planning for the treatment and dissemination of information.

Keywords: Communication. Information management. Network society. Crisis management. Information.

1 INTRODUCTION
The concept of information defended by BARRETO apud XAVIER and COSTA (2010) is defined as “a significant structure with competence and intention to generate knowledge in the individual and in his group, enabling his development and well-being”. This view corroborates the ideology in which information fulfills a physicalist bias, in the sense of information as a thing (information-as-think) by Buckland; a cognitivist bias, recognizing the importance of the individual and his psychic interaction in managing information and generating knowledge; and its social bias, which assesses the environment in which the knowing individual interacts.

SILVA and JUSTAMAND (2021) remind us that the coexistence with information through the media is an intrinsic process and serves as an extension of our senses. “We have moved from a community society, in which everyone knows each other and knows the information among themselves, to a joint-stock company”. This stage we are in, for the authors, is conditioned by urbanization and the process of massification of the media, which produce information and tend to guide themes of common interest.

It is inferred, then, that this process - the production of information and, therefore, of knowledge and its dissemination - has a natural flow, which often occurs in the unconscious of everyday social life. However, there is a condition that it be handled by whoever, having privileged access to certain information, cuts it off and promotes partial access.
Managing this flow is a major challenge in our age. Scholars note that since the 20th century, with the strengthening and rapid dissemination of Digital Information and Communication Technologies (ICTs), there has been the possibility of a disorderly production and dissemination of an exponential amount of new content. This factor generates an overload of information, which makes it difficult to handle the so-called “strategic” information.

Such reflection becomes even more relevant when communicating – which for CASTELLS (2015) is to share meaning through the exchange of information – in crisis situations, which put the image of corporations and organizations at risk in society. In a hypothetical condition – as illustrated in the image above – that would involve the Institute for Energy and Nuclear Research (IPEN) in Brazil, what information should be brought to the public to maintain order and stability without exposing information considered critical by the institution?

Seeking this forecast involves a series of variables that go through economic interests, social stability and maintenance of credibility, variables that do not allow impromptu actions in the treatment of information and in its management. For this article, we seek to cut an episode of recent Brazilian history, in order to analyze the communication strategies adopted with the public and their implications.

2 OBJECTIVE

To make a critical analysis of information management during the Rio 2016 Olympic Games by the Brazilian State. To analyze, based on what was published in the media, the actions carried out during the “Brazilian terrorists” episode, based on concepts and recommendations from manuals in the area, especially from the IAEA, and from the Law on Access to Information in Brazil. Propose actions that bring improvements in the management of information in crisis.
3 METHODOLOGY

The proposal of the article will be made in the model of a case study, with a direct approach and bibliographic base. Such choice is justified in the intention of registering, examining and correlating facts or phenomena. For this, concepts of information management guides and other documents in the area will be opposed to the statements and behaviors of the authorities and others involved in the case under analysis, seeking to counter this communication reaction to the theoretical aspects of information management and the guidelines perceived in the manuals.

4 DISCUSSION

In 2009, Brazil won the right to host the Games of the XXXI Olympiad, a competition that would take place for the first time in South America. Among the many preparations to promote the sporting event were security-related measures. This topic gained greater relevance months before the start of the Rio 2016 Games, due to terrorist attacks that took place on the European continent, especially in France and Belgium.

The occurrences opened precedents for the inference that the Olympics were a potential target of this type of action, combining the global context of the attacks with an increase in the adhesion of Brazilians to the ideology of the Islamic State. In April 2016, the Brazilian Intelligence Agency (Abin) confirmed that the risk of attacks in the country had increased due to migratory facilities and the increased use of the internet as a mechanism for action. The Agency also confirmed the authenticity of a profile on a social network where Frenchman Maxime Hauchard, a member of the Islamic State, said that Brazil would be the organization's next target.

On the first day of July of that year, Abin's concern was no longer with attacks of great sophistication and logistical complexity, but with the so-called “lone wolves” 1. At the time, the Agency indicated that it was focused on monitoring individuals who showed radicalization behavior by ideologically aligning themselves with the Islamic State. The disclosure was also supported by the discovery of a communication channel in Portuguese for the exchange of information about the terrorist group in a messaging application, this factor being interpreted “as a door for Brazilians to be radicalized”.

At the same time, a consulting firm specializing in actions by extremist groups on the internet reported that the Islamic State (IS) and other jihadist groups were inciting their followers to promote terror in Rio de Janeiro. They offered specific advice on how to attack using drones with small explosives, traffic accidents or through the use of poisons and medicines.

The fact that Abin exposed this data generated strong criticism from the Secretary of Public Security of Rio de Janeiro at the time, José Mariano Beltrame. “When we have investigations of important things to do, we don't talk. People show results. In my view, it should not have either confirmed or disconfirmed.”

1 A “lone wolf” is a terrorist who acts alone, at the time and place he deems convenient.
The lack of consensus was not only in the handling of disclosures between Brazilian authorities involved in security issues. On July 8, 2016, the then Defense Minister declared that “no intelligence agency in the world has traced the possibility of a terrorist attack during the Olympics”, contradicting the reports and information released by Abin.

The contradiction gained new life when an official report by the French government's intelligence agency disclosed that the Islamic State terrorist faction had planned attacks on the French delegation during the Games. Reported by the press in July, the information had been given by General Cristophe Gomart in May, during the session of a parliamentary commission. According to him, there were indications that a Brazilian could have been behind the planning of these attacks, and the identity of this individual was not clear.

Almost thirty days earlier, Veja magazine had already named one of the priority targets of Brazilian surveillance in the fight against the threat of terrorism in the national territory. It was Ismail Abdul Jabbar Al-Brazilī – or, simply, “The Brazilian”. According to the report, he was one of those responsible for supplying the propaganda channel with texts in Portuguese (released by Abin days later), in addition to being a Brazilian fighter for IS. The report also included excerpts from a reserved report authored by Abin and distributed to the authorities involved in the Games’ security scheme.

Figure 2 - Copy of Abin's report published by Veja Magazine in 2016

The IS supporters in Brazil have been adopting new online security measures that make it difficult to monitor them. It might mean that the execution of a concrete act of terrorism in the country is being discussed or planned. (Unify this word when referring to “Brazil”, with capital or small initial.) This process is similar to the actions adopted by the Salafi community in different moments and countries where terrorist attacks occurred. This way the Rio 2016 games establish a factor of high attractivity for the actions of terrorist groups in Brazil. An attack scenario like Paris, which use improvised guns and bombs and happen simultaneously at different points of the city represents great responsibility and demands investigation and coordinated actions by companies and agencies present in the security context. The dissemination of radical Salafi ideology among Brazilians allied to the legal and operational limitations in monitoring suspects and the difficulty in neutralizing preparatory acts of terrorism point to an unprecedented increase in the probability of attacks occurring throughout 2016 in Brazil, especially due to the Rio 2016 game.
On the 21st of July another state authority enters the scene. The then Minister of Justice, Alexandre de Moraes, announced that the Federal Police had launched Operation Hashtag, carried out simultaneously in 10 Brazilian states. It resulted in the arrest of 10 Brazilians suspected of preparing terrorist acts for execution during the Olympics.

According to him, the intelligence service proved that the arrested group went from simple comments on messaging apps to, in fact, "preparatory acts" for the attack. At the time, the minister did not detail what exactly supported this certification. He also stated that the members had sworn an oath of loyalty to IS over the internet, that the group had exchanged messages commemorating attacks in France and the United States and that one of them had contacted a website in Paraguay to purchase an AK 47 rifle.

Commenting on the arrests, the then Defense Minister, Raul Jungmann, said that the group of prisoners was amateur and that they had no direct contact with IS. According to him, they were people with no tradition for the practice of terrorism and without any evidence that could be used as preparation or history of action. Even so, he stated that the group would have to pay a very high price, “because a preparatory act can be up to eight years in prison. For terrorism you go up to 30 years in jail. The penalties are tough. And here, a warning to anyone who wants to follow this path: we are monitoring, especially social networks, all of them, in this regard”.

On July 22, an 11th suspect turned himself in to police, who confirmed they had received an FBI alert about suspects who were detained in Brazil. In common, they all had a devotion to the Islamic religion and the use of false names on the internet, in addition to the fact that some of them knew each other, which could reinforce the thesis of a possible articulation for carrying out a terrorist action.

On the same day, Sheikh Ahmad Al-Khatib was coerced by the Federal Police to testify about his proximity to two of the arrested suspects who had been his employees in the past. Owner of a furniture factory and responsible for the NGO Núcleo Islâmico Livro Aberto, he and his family had cell phones, computers and tablets confiscated by the police. In his words, the two suspects were Islamic State sympathizers, but he was skeptical of the possibility of both participating in terrorism. For him, the action of the police was hasty. “If they were called to testify, they would go of their own free will,” he said.

An analysis of the information management procedures adopted by the State bodies that were related to the event and their possible alignment with the theoretical ideal of communication indicate that controversies marked this process. One of them is the fact that the Minister of Justice called a press
conference to detail an operation that was under judicial secrecy. Apparently, the disclosure of the arrests was made at an inappropriate time.

“Started 15 days before the start of the Games, and a week after the attacks in Nice, France, with extensive news coverage, Operation Hashtag found public opinion already sensitized to the topic of terrorism” stressed JORDÃO (2017). Furthermore, the typification of the crime presented had very fragile bases that were not confirmed. JORDÃO recalls that one of the evidences for the arrests was the attempt to buy a rifle by one of the suspects.

The evidence, it turned out later, referred to an email actually sent to a store in Paraguay, but in 2015, and not on the eve of the Olympics, as Moraes suggested. The purchase did not materialize. The minister would rush once again to the press conference by wrongly attributing the leadership of the alleged cell to a suspect detained in Paraná, Levi Ribeiro Fernandes de Jesus, 21 years old – a fact that was not proven in the PF investigations.

The operation also had three ostensible phases in the month of August, during the Games, and away from the press spotlight. In total, another 15 people had temporary arrest decreed, of which eight were denounced by the Federal Public Ministry (MPF) and became defendants. The thesis that there was a planned attack on the Olympics, however, was never confirmed.

The MPF prosecutor, Rafael Miron, recalls that there were exchanges of messages and a very strong intention to do so, but no facts. “In reality, conversations mostly revolve around discussions about IS, commemorations of attacks in Europe and effective methods of communication.”

The complaint signed by the prosecutor contains several images and more than 60 excerpts of dialogues or sentences extracted from the conversations intercepted between the group of suspects, seven of which contain some kind of mention of the Olympic Games. The most extreme of them points to the intention to contaminate Rio de Janeiro's water resources.

When arrested, these Brazilians suspected of terrorism did not carry chemical materials, explosives or weapons. Eight of them were denounced by the Federal Public Ministry (MPF) based on articles 3 and 5 of the Anti-Terrorism Law. Leonid El Kadre de Melo was the only one to answer for the fifth article (carrying out preparatory acts of terrorism), in addition to being appointed – after Levi Ribeiro – as the leader of the group. Leonid was the oldest of the group and the only one with a criminal record (he served time for murder). He was on parole and was with his brother, Valdir Pereira da Rocha, when they were both arrested.

---

survey carried out by JORDÃO (2017) indicates that “the idea of an attack that would poison the waters of Rio is, to say the least, unreal. The Guandu Water Treatment Station, located in Nova Iguaçu (RJ), is responsible for supplying 85% of the water in the city of Rio de Janeiro, serving 9 million locals. From there, 3.6 billion liters of water come out per day. Poisoning a source of this magnitude would require, according to experts consulted by Pública, 90,000 liters of chemical solution capable of causing toxicity, or something like six medium-sized water trucks”.

Leonid’s temporary detention \(^4\) was revoked in September 2016, after the Federal Public Ministry deemed his participation in the episodes secondary. His brother Valdir was not so lucky. An inquiry by the Civil Police of Mato Grosso indicates that he was beaten to death by about 20 inmates at the Várzea Grande Public Prison. The reason for the lynching was “the fact that he was a terrorist”, a condition not accepted by the “code of ethics” of the criminal world.

5 CONCLUSION

The case of Brazilian “terrorists” shows a series of dissonances when we analyze the information management process in opposition to theoretical assumptions. One may question, for example, the responsibility of the authorities when coining the term “terrorism” to name those still suspected of a crime that, in the course of the facts, was not confirmed. In doing so, considering that at the time of the announcement there was still an investigation in progress and under judicial secrecy, there is an anticipation of fundamental steps to maintain transparency (in the sense that the information disclosed is true) and openness (in the meaning to reveal only what is essential).

By opting for early disclosure, the principle of maintaining a sense of social stability was put at risk, as the possibility of panic in the population was increased. The promotion that Brazilians were aligned with terrorist groups and with the possibility of carrying out extreme acts – although this possibility was far from happening in practice –, may also have impacted the decision of foreigners to go to Rio de Janeiro to follow the games.

Although at the time the mayor of the city, Eduardo Paes, had a positive assessment of this factor with data that pointed to the visit of 1.17 million tourists, 410 thousand from abroad, a report by Euromonitor shows that these numbers were timid\(^5\). The observation is that the major sporting events in Brazil (the 2014 World Cup and the 2016 Olympics) did not place the country on the Latin American tourism route. There are certainly many factors that can influence this issue and the feeling of security is inevitably relevant.

Finally, the disclosure by the authorities that there were “terrorists” in Brazil, even if their methods were ineffective in carrying out extremist acts, could create a problem that does not exist insofar as it programmed the communication network of the society and generated a new node of influence. People

\(^4\) In 2017, “Leonid El Kadre de Melo was convicted under Article 5 of the Anti-Terrorism Law, referring to ‘recruitment for the purpose of committing acts of terrorism’. He was sentenced to 15 years, 10 months and 5 days in prison, the longest sentence of all. Recruitment, according to the judge, took place through virtual means, and in ‘the frequency with which he addressed others and his frequent insistence that they form a terrorist cell in the state of Mato Grosso’. He was charged with the crime of recruiting ‘encouraging, recruiting’, ‘individuals and organizing people with the purpose of forming an ISIS action group in Brazil to carry out acts of terrorism’. In his sentence, the judge notes that this type of crime (recruitment) is of ‘anticipated consummation’, that is, it is not necessary to ‘effectively go to the place where they were called’”. In addition to him, eight other defendants were convicted on the basis of article 3 for “promotion of terrorism” and “criminal association”.

\(^5\) According to the report, Brazil had a “modest” annual growth of 3% in the number of foreign arrivals between 2012 and 2017, against almost 6% in Costa Rica, 8% in Mexico and 10% in Chile and Colombia.
seeking notoriety, unhappy or otherwise, could be influenced by media coverage and be induced to commit crimes that perhaps were not even planned.

The conduct of this case also shows that there is no more room for improvisation in communication policies. The establishment of the network society makes it clear that the information management process needs to be professionalized by the authorities, bodies, and entities that need to be prepared to protect their assets, their power, and their ability to influence their partners and society.

If the culture used to be reactive, of action after the establishment of the critical fact and its consequences, the current panorama of a society that is quickly permeated by the speed of flow of information, requires that these actors (authorities, companies, and public entities) are previously prepared to condition their processes and establish doctrines that are capable of pragmatizing the methods to be used and protecting their image and reputation.

History demonstrates that the Olympics took place in Rio without any act of terrorism. An analysis of the way in which the information was managed, however, indicates that there is an opportunity to re-evaluate the communication and publicity procedures of sensitive factors related to crisis situations.

ABSTRACT
Contemporary society is increasingly being marked by discourses on the environment, sustainability and the need for sustainable and ecologically correct consumption. For this discourse, organic food has gained more prominence in the Brazilian and world scenario. With the growing demand for these products, the changes arise on the packaging. Knowing that the world's plastic industry has been increasing, causing serious environmental problems due to its inability to biodegrade; the use of renewable resources has been exploited, which can reduce waste disposal costs. Consequently, the development of biodegradable materials of organic base emerge as an alternative to this and packaging. Therefore, this study aims to present a narrative bibliographic survey addressing the theme related to organic food and biodegradable and organic packaging. For the narrative review, research was conducted in databases such as: SCIELO, Science Direct, PubMed and national and international websites related to the theme. Based on the study, among the alternatives for the production of an organic-based film, starch is one of the bases that are researched and considered a good substitute for traditional packaging. However, there is a need to add a plasticizer in its formulation, logo, the incorporation of a natural stiffing pla, which may be organic, should be in vestigada by future research. This organic-based material can be used in different food products.

Keywords: organic food; alternative packaging; organic packaging; sustainability; sustainable consumption.

1 INTRODUCTION

"Organic farming" (or "organic" or "ecological" agriculture is a complete system approach based on a set of processes that result in a sustainable ecosystem, safe food, good nutrition, animal welfare and social justice (IFOAM, 2009).

A food is considered organic when it is produced in an environment based on agroecological production processes that make responsible use of soil, water, air and other natural resources, while also respecting social and cultural relations. Differing from the conventional by the absence of pesticide residues keeping the soil healthy and observing the controllable levels of pests to increase their crops (Boobalan et al., 2016).

The consumption of organic food has been proposed as a way to a more sustainable society. As a result, the purchase and consumption of organic food has been increasing worldwide. According to (FiBL and IFOAM, 2022), the organic market in the world expanded from 15.1 billion euros in 2000 to 120.6 billion in 2020 (Dorce et al., 2021).

The packaging in its context and functions is of great importance to organic foods mainly, both in transportation and in its protection against contaminant agents, and it is an integral part of this growing...
demand and has been exerting great changes in industries. Organic products have in their concept the concern of reducing the impact of their production on the environment, porém, it is known that the composition of traditional packaging, are not mostly sustainable (Boobalan et al., 2016).

In the daily life of the population, disposable plastic materials, such as plastic bags, among others, for packaging for food use are in every corner of society and become important and indispensable items. However, due to the non-biodegradability of most of these plastic products, since they are discarded at random, they will cause environmental pollution being a short- and long-term concern, also known as "white pollution". Therefore, more and more countries are restricting the use of non-biodegradable disposable plastic products (Dai et al., 2019).

In recent years studies on biodegradable and edible films, such as protein, lipid and polysaccharides, are being carried out. In particular, starch has been the focus of a series of investigations because it is biodegradable, renewable, low cost, edible in nature and with wide availability (Cui et al., 2021; Gutiérrez et al., 2015).

Starches have the ability to form transparent and odorless films with good barrier to oxygen, which is extremely beneficial for food preservation. Of the starches, cassava starch stands out, because it is a very common raw material, besides having reduced cost and has wide availability. When compared to other starches, their extraction generates fewer impurities, which improves extraction efficiency (Caetano et al., 2018; Li et al., 2020) Thus, a bibliographic narrative survey was carried out, in which it has the purpose of describing and punctuating biodegradable materials that can be organically based as a packaging alternative for food products.

2 METHODOLOGY

The review was carried out through a narrative bibliographic survey. Narrative review articles are publications with the purpose of describing and discussing the state of the art of a given subject. Given the scope of the theme and the difficulty in establishing a precise research question, the narrative review was used because it allowed an expanded discussion (Lopes et al., 2022; Martinelli et al., 2019).

For the research, a survey of scientific articles in the literature was conducted through online databases: Scopus, Science Direct, Scientific Electronic Library Online (SCIELO), PubMed Central (PMC), national and international sites with reference to organic foods, websites of Brazilian government agencies and Brazilian Agricultural Research Company (Embrapa).

The search of the articles for review was carried out by combining the terms: organic food, organic agriculture, biodegradable material, film and starch-based coating and demand for organic foods. The inclusion criteria defined for the selection of articles were: publications in Portuguese and English, which portrayed the theme related to organic products and biodegradable packaging. There were no specific dates for searching, so archives published and indexed were obtained in the databases between 2005 and 2022,
totaling 166 articles and after reading the manuscripts 94 were excluded for not meeting the purpose of the research, as exemplified in Figure 1.

3 ORGANIC FOOD PRODUCTION

Organic agriculture was driven by movements at the end of the 19th century that opposed traditional food production systems and the environmental damage they brought. Thus generating the beginning of a chain for a healthy diet and a better quality of life (Moraes, 2017).

According to IFOAM (International Federation of Organic Agriculture Movements), organic farming is a production system that sustains the health of soils, ecosystems and people. Combining tradition, innovation and science. Its role ranges from production, processing, distribution, to consumption. It thus guarantees the sustainability and health of the ecosystems and organisms that compose it (IFOAM, 2020; Moraes, 2017).

According to its definition, organic farming is one of the alternatives for the production of a safe food within the standard of food safety, and also of food safety. The international standard in organically produced foods comes from the "Codex Alimentarius", originated from the United Nations Food and Agriculture Organization (Efing et al., 2019).

In the literature, several definitions of organic foods are found, among which are presented as: "Foods considered organic are those produced in an environment where agroecological principles are used as the basis of the production process, contemplating the responsible use of soil, water, air and other natural resources" (Boobalan et al., 2016). Under Brazilian legislation, an organic food, fresh or processed, is one derived from an organic system of agricultural production or a sustainable extractive process, being not yet harmful to the local ecosystem (BRASIL, 2020).

Currently in the world, there is a growing demand and acceptance for organic products, mainly due to the harms that pesticide residues and chemical fertilizers can cause to the health of the consumer in the food chain, paving the way for awareness of the use of these chemical agents the addition of preservatives during the manufacture of food by companies (Boobalan et al., 2020; F. Silva et al., 2016).

According to the Research Institute of Organic Agriculture (RIBL), an independent European non-profit institution, data from the 2018 organic world production from 178 countries show that the sector occupies 71 million hectares (Table 1), about 1.2% of the world's producing areas. The market is led by the United States, both in exports (£2.9 billion), imports (£1.8 billion) and sales (£40 billion), followed by Germany (£10 billion), France (£9 billion), China (£8 billion) in sales (RIBL, 2020).

South America has a total of 8 million hectares, with Brazil touted as the leader of the organic market, but in an extension of land destined for organic agriculture, the country is in third place in the region, followed by Argentina and Uruguay (FIBL, 2020).

The country with the highest number of organic producers is India (835,000), according to Bruno et al. (2019). While in South America the largest number of organic producers is concentrated in Peru.
4 LEGISLATION FOR ORGANIC PRODUCTS

The first movements of organic certifications took place in Europe in the 1920s, where the Demeter system of biodynamic organic products was created, whose seal is found to this day (ABD, 2021; Moraes, 2017).

In Brazil, the certification follows the line defined by the Ministry of Agriculture and Livestock (MAPA), being recognized by IFOAM. Its culture and commercialization of organic products began in 2003, however, its regulation occurred only on December 27, 2007 with the publication of decree No. 6,323 (BRASIL, 2020).

Based on Law No. 10,831 of December 23, 2003, all those who intend to market organic products in Brazil must have registration with MAPA, more specifically through the Brazilian Organic Compliance Assessment System (SisOrg). The law established the use of the SisOrg seal for certified products. It is defined, therefore, that certification can be carried out in three ways: by audit, by participatory guarantee system, and by social control in direct sales (BRASIL, 2020).

Abroad, the international body that accredits the certifiers is IFOAM, which is the international federation that brings together the various movements related to organic agriculture.

The labeling in Brazil, specified as organic, is regulated by federal law no. 10,831 of 2003. In 2007, Decree No. 6,323 established the rules of certification and supervision.

Through Article 119 of Annex I of Normative Instruction No. 19 of 2009, MAPA in Brazil established for the domestic market that organic quality information must be stamped on the front of the label, with specific terms for "Organic" or "organic product" for those with 95% or more of organic ingredients; and "product with organic ingredients" for products with 70% to 95% of organic ingredients, among more variants, when with less than 70% of organic ingredients can not have any expression to organic quality (BRASIL, 2020).

The production, processing, labelling and marketing of organic products, for example, in the European Union are governed by Reg. 834 of 2007 and its implementing regulation - Reg.889 of 2008, which covers primary or processed products of plant or animal origin; in the United States, they are governed by the USDA-NOP (National Organic Program), section 205 (7 CFR 205), Japan, the legislation governed by jas (Japan Agricultural Standards), while in China it is governed by the National Regulation of the Republic of China for organic products (Ecocert, 2020).

5 CONSUMER PERCEPTION

Since the growing demand for organic crops in the world, through the sale of large retailers, as well as creation of its own brand for organic, at least two barrea have been removed for their consumption: high price and low availability. The consumer reacted positively to the spread of organic products. Its
characteristics meet the needs of more naturalness and sustainability, demonstrating more respect for animal welfare, and giving importance to human and cultural values (Carfora et al., 2019).

According to literature, it is unanimous to verify the main perceptions of consumers regarding organic foods. The main drivers of buying and consumption are due to the fact that they are said to be healthy and less harmful to the environment than conventional foods and promote support to the local economy and the community (Dorce et al., 2021).

Trust between the consumer and food is a factor that can be added as a buying motivator. The organic product is made through process certification. Trust in the certification system is critical to the integrity of organics. Thus, trust becomes loyalty to the brand, so the consumer has a greater willingness to pay for the product (Carfora et al., 2019; Castaldo et al., 2009; Menozzi et al., 2015; Pivato et al., 2012).

Koklic et al. (2019), through their study, pointed out areas that can directly shape the intention to purchase organic products: attitudes towards the consumption of organic foods, past consumption and personal norms. That is, the consumer's intention to buy organic food becomes stronger with more positive attitudes, an increase in the frequency of organic food consumption in the past and stronger personal standards. In addition to the study of past behavior being an important predictor of future actions and intentions, directly affecting the norms and personal attitudes regarding the purchase of organic. Moral influences influence the intentions of buying, for example, environmental concern exerts an effect via moral or personal norm.

Lamonaca et al. (2022) in their research, cited other characteristics as intention to purchase organic products, such as nutritional information on the packaging, sympathy through a label with carbon footprint and organic and quality labels.

6 ALTERNATIVE PACKAGING FOR ORGANIC AND CONVENTIONAL FOODS

It is a fact that packaging can influence the impression of consumer taste, generating emotional responses and predisposing the same to buy the product. It presents itself as an integral part of a system. In the literature, three functions for traditional packaging are covered: (1) containment and handling, (2) protection and preservation and (3) information and communication (Becker et al., 2011; van Herpen et al., 2016). Traditionally, plastics, papers, glass and metal containers have been used to pack food. However, when performing these functions generates a cost, both monetary of the packaging material itself and the environmental load that it causes (Amin et al., 2021; Roper et al., 2013).

According to the IFOAM principle, the packaging of organic products should have minimal impacts on food or the environment. As a recommendation, these should be packed in reusable, recyclable, recycled or biodegradable packaging when possible (IFOAM, 2009).

Retailers' preference is common in marketing organic products in plastic bags, so that they can be clearly distinguished from conventionally grown ones and ensure that the consumer buys the product at the correct price. In addition, some supermarkets also prefer plastic bags to ensure the organic integrity of the
product. The organic claim is, in fact, about how the product is grown, however, supermarkets are responsible for maintaining the separation between organic and conventional. Violation of regulations in place to protect this problem can result in severe fines to the retailer (Dole, 2020).

However, in a study conducted in Europe, researchers concluded that removing the primary packaging (plastic packaging) of organic fruits and vegetables would be a promising intervention in attempts to increase sales of organic vegetables, since it would fit better with the environmental image of the product (Van Herpen et al., 2016).

Alternatively, great advances in the packaging area have come since its creation in the 18th century, among them are biodegradable packaging, which can be active and intelligent.

In the literature, several studies developing and applying different types of biodegradable packaging can be found. Produced from renewable sources, such as starch, protein, lipids and developed from agro-industrial waste, as unused parts of fruits and vegetables, which have bioactive compounds and that can provide interaction with the packaged product, bringing additional advantages in food preservation (Miglioranza et al., 2021)

Biodegradable films arise due to environmental concerns and the need to protect consumer health. Through biomaterias (natural materials) of food quality, these packages can extend the life of the product acting as a selective barrier against moisture and oxygen. They reduce lipid oxidation by controlling oxygen transmission and synthesis of volatile compounds, factors responsible for the production of unwanted odors and flavors (Amin et al., 2021; Enujiugha et al., 2018).

To control food quality and improve food safety standards, i.e. expand the functionality of biodegradable packaging, bioactive and functional substances such as antimicrobials, antioxidants, vitamins, flavonoids, etc. can be incorporated. Thus, these materials can be used as carriers of bioactive compounds, increasing the nutritional value of food products or to extend the shelf life of the packaged product (Lu et al., 2019; Salgado et al., 2015).

To this type of packaging, Glicerine et al. (2021), conceptualize as active packaging, where there is a system in which the packaging, product and environment actively interact prolonging the shelf life and or increasing the safety and sensory properties of food products during storage.

Miglioranza et al. (2021), compared the application of a biodegradable film, based on grape seed flour extract and PVA (Polyvinyl alcohol), as a packaging for dehydrated fruits, using raisins of the crimson variety without seeds, with conventional poly film (ethylene) packaging, obtaining higher phenolic contents and antioxidant activity for raisins packed with biodegradable film after 182 days of storage.

Motta et al. (2020) developed films based on non-ionic, cationic and anionic starches incorporated with the cationic surfactant LAE, aiming to provide an alternative to extend the shelf life of food products.

Nakashima et al. (2016), studied the development of collagen-based films with concentrations of clay, plasticizer and essential oil of clove on the characteristics of color, opacity, tensile strength, solubility, water vapor permeability and film thickness. Concluding that collagen films obtained good mechanical
properties, adequate visual appearance and easy handling, as well as low permeability to water vapor and solubility in water. The addition of essential oil was effective in the structure of the film, improving the appearance and handling.

Costa et al. (2020) developed and characterized edible films produced by polymerblends, composed of natural polysaccharides, aiming at their use as edible coatings for fruits. Polymeric films from Quitosana, Pectina, Cassava Starch, Chisan + Pectina, Chitosana + Cassava Starch, Pectina + Cassava Starch and Chitosana + Pectina + Cassava Starch were developed.

### 7 STARCH-BASED PACKAGING MATERIALS

Renewable raw materials such as polysaccharides (starch, pectin, alginate, carboxymethylcellulose and chitosan), proteins (wheat gluten, whey protein isolate, caseinate and soy protein) and lipids (waxes and fatty acids) or a combination of these have been studied to prepare biodegradable edible films and coating. However, several studies report that polysaccharides from different sources are promising materials for the preparation of films and coatings with bespoke behavior, considering that they are natural, non-toxic and biodegradable polymers (Enujiugha et al., 2018; Guimarães et al., 2020; Schmid et al., 2018).

Starch has been reported as a cheap material, besides having excellent film forming capacity (Hassan et al., 2018; Kang et al., 2020).

It is a polymer that occurs widely in plants such as potatoes, corn, rice and cassava. In all these plants, starch is produced in the form of granules, which vary in size and composition depending on the plant. In general it is formed by two types of glucose polymers: amylose and amylopectin, with different structures and functionality. The proportion between amylose and amylopectin is variable with the botanical source, conferring specific characteristics to the starch paste. In food use, both fractions are readily hydrolyzed in acetal bonding by enzymes (Chandra et al., 1998).

Starch films are one of the most effective biodegradable packaging materials in terms of performance, adaptability, processability and cost. Through the composition of starch, amylose and amylopectin, effects on the formation and properties of film occur. The linear structure of amylose promotes high-level hydrogen, through the bond between its molecules forms a crystalline structure. Amylose chains are relatively long linear chains, this allows a better interaction between polymer chains due to better approximation or accommodation of chains. While amylopectin chains result in films with weak and brittle characteristics due to intermolecular bonds disadvantaged by the existence of short chains and branches (Jha, 2020; Suh et al., 2020).

However, starch films have some limitations, such as strong hydrophilic behavior, which makes high sensitivity contact to moisture and low mechanical properties (Jha, 2020).

Aiming to serve the consumer in the search for improvement of quality, safety and the extension of shelf life of the product, biodegradable materials based on starch has been studied for the food industry as packaging materials (Table 2).
Several studies have been conducted to analyze the properties of starch films produced from different botanical sources, such as corn, wheat, cassava, yams and potatoes (Cui et al., 2021; Galdeano et al., 2009).

Among the starches of various botanical sources, cassava starch stands out for being an excellent raw material for the production of biodegradable materials and is useful for industrial applications. When compared to other starches, it is easily extracted, resulting in a white product without the need to use bleaching agents. Most of the granules are rounded, with the flat surface on one side and a cavity on the other. According to the variety and the harvest period exhibit great variation in their size (5 to 40 μm) (Chollakup et al., 2020; Dai et al., 2019).

In addition to being biodegradable, films and coatings produced from cassava starch are odorless, tasteless, colorless and non-toxic. Furthermore, the films have good mold resistance and permeability, are flexible and extensible materials of homogeneous and smooth surfaces. The production of films from the starch is based on its gelatinization, which occurs above and at 70°C, followed by cooling (Cortés-Rodríguez et al., 2020; Dai et al., 2019; Lim et al., 2020; Luchese et al., 2021; Suh et al., 2020). However, pure starch films have more fragile mechanical properties, consequently it is necessary to use additives, such as plasticizers, to improve their characteristics (Chen et al., 2019).

Plasticizers are additives necessary for the manufacture of films, such as starches, because films that comprise only starch are rigid, brittle and inflexible. Generally glycerol and sorbitol are used as plasticizers. These improve the flexibility of starch film by reducing the hydrogen bond between macromolecules and increasing intermolecular spacing between chains (Lim et al., 2020).

Although hydrophilic compounds, such as polyols (glycerol and sorbitol), are commonly used in starch films, some sugars, amino acids, carbamides and fatty acids can also be used (Maniglia et al., 2019). In the literature can be found studies with the development of starch-based films and different plasticizers, as exemplified in Table 2.

8 NATURAL PLASTICIZER TRENDS

As the alternative packaging industry grows, the proportion of demand for new plasticizers also increases. Since the use of phthalates (the most used nowadays), has been questioned due to toxicity problems, which are related to the migration of these compounds. Therefore, alternatives to traditional plasticizers are sought, which come from biological sources and that meet requirements such as low toxicity, low migration and biodegradability (Liu et al., 2020; Rocha, 2019; Vieira et al., 2011).

In the search for new biodegradable packages of natural and organic source, the option of sugars, honey and lipids can be studied.

Sugar is a generic term for edible candied carbohydrates, mainly sucrose, lactose and fructose. It is produced by all chlorophyll vegetables, through photosynthesis. Of the different types of sugar, brown, organic or not, stands out, once produced from sugarcane, does not go through any kind of refinement.
process, so there is no chemical additive in its composition. Thus maintaining its nutritional quality, vitamins and minerals (Bettani et al., 2014).

The use of sucrose as a plasticizer is recommended in cassava starch films and may increase elongation at rupture, however crystallinity has been observed during storage, changing the material from malleable to brittle (Veiga-Santos et al., 2007). For example, Santos (2004), observed crystallization after 10 days of storage in films based on cassava starch and sucrose as plasticizer. It is then indicated to use a wetting as propylene glycol to avoid crystallization of the films. If sucrose is added to the filmogenic solution, all granules should be completely homogenized so that there are no crystallization nuclei, affecting the final structure of the eriais mat along the stocking.

Honey, considered a natural product, is composed predominantly of sugars such as fructose and glucose, in addition to enzymes, minerals, organic acids, hydrocarbons, amino acids, B vitamins, vitamins (C, D and E), antioxidants, water and substances that give it aroma and flavor, being a replacing resource of sugars (Garcia et al., 2018; M. G. C. da Silva et al., 2018). As for the possibility of using organic honey, it would qualify as a product free from undesirable chemical and biological contamination. In literature, several studies addressing antioxidant properties (Beiranvand et al., 2020; Gonzalez-Ceballos et al., 2020) and honey antimicrobial (Alvarez-Suarez et al., 2010; Estevinho et al., 2008).

Santagata et al. (2018), for example, used pectin-honey coating in dehydrated fruits (apple, melon, mango and pineapple) to explore the antimicrobial activity of mel. However, there are still no studies as a possible contribution to plasticization.

Lipids are compounds that originate from natural sources such as animals, insects and plants, the diversity of lipid functional groups is composed of phospholipids, phosphatides, mono, di and triglycerides, terpenes, cerebrosides, fatty alcohol and fatty acids. In films and coatings lipids can provide some characteristics such as brightness, minimizes moisture loss and alters packaging complexity (Mohamed et al., 2020). Biological-based plasticizers can be obtained from plant or animal sources, in this set are oils obtained from agricultural plant sources, by-products of them, or even from residues. Vegetable oils, as well as coconut oil, appear in this group as highly available, low-cost, non-toxic alternatives from renewable and non-volatile sources (Liu et al., 2020; Rocha, 2019).

Coconut oil is useful in several sectors, such as food, pharmaceutical, cosmetic and also in biofuels, since there is the presence of methyl esters present in the oil. In packaging research, it is evaluated as antioxidant and antimicrobial, since it contains polyphenols in its composition, and can inhibit oxidation. In addition to having a free fatty acid content of less than 0.1%, fatty acids with a normal distribution of the carbon chain and a reasonable composition of saturated and unsaturated fatty acids. The addition of coconut oil can reduce water permeability in films and food coating (Fangfang et al., 2020; Neto et al., 2020). As for the possibility of this also having influence on the mechanical characteristics of films has not been reported.
It is important to highlight that a good plasticizer usually provides high plasticization in low concentration and promotes rapid diffusion and interaction; while its efficiency is defined as the amount of plasticizer required to produce the desired properties of the film. Therefore, to optimize the properties of final use of the materials, it is important to study the effect of plasticizer concentration on mechanical resistance. (Versino et al., 2019).

9 FINAL CONSIDERATIONS

This article surveyed the concept and increased demand for organic foods, addressing traditional packaging and alternatives for food products. Being able to develop biodegradable organic materials closing the cycle of the chain of food and organic products.

Many studies show increased consumer awareness of products that meet environmental protection, health and food safety. Given environmental protection, biodegradable packaging based on natural resources has received considerable attention.

Busing an organic packaging has the possibility of using an organic starch as raw material for its production. This is a base of low ash, besides abundant, biodegradable and even edible. And emphasizing that all the insums used in the production of this packaging are of organic origin, it makes the concept of this packaging more challenging.

Future research is necessary, both bibliographical and experimental, where the objective is to study the possibility of incorporating natural and organic plasticizers into a filmogenic solution in order to obtain organic and biodegradable base materials. Going according to the ideology of organic foods and this material can be used for other products.

CHAPTER 91

The management by competencies as a differential in the professional acting

Ana Cristina Brandao Ribeiro Silva
Horizon College
Federal District
http://lattes.cnpq.br/4304322128169522

ABSTRACT
The main objective of this work is to describe qualitatively the actions indicated to implementing the management by competence, also discussing its combination with the management by performance. It also looks forward to observing the management by competence relation with the process of technical and behavioral development of professionals into the institutional guidelines, identifying what are the necessary competencies and career anchors for the organization to reach advantage in the labor market, and discussing that the executive secretary has a relevant role in this implementation process. The analysis of the results points mainly to the effective participation of the executive secretariat professional in the application of the model, as well as the relation of the career anchors with the competencies demanded by the organizations.

Keywords: Management by competencies. Executive secretariat. Professional anchors. Technology

1 INTRODUCTION

Competency management is related to the concern with the performance of professionals aimed at achieving the company's objectives, with a bias towards the selection, retention and performance of employees. Carbon et. al., (2009) point out that organizations have used this model to achieve their organizational goals. On the other hand, Strauhs (2012) emphasizes that this model promotes the development of the necessary skills for the position or function that the professional will occupy. In turn, Carbone (2009) indicates that if actions with this purpose are not implemented, the tendency will be to increase the existing gaps. This is a key element that should not be restricted to specific units on the respective subject.

In this way, considering the hierarchy established in the units, the leaders of the area can exercise this management of competences with the professionals who are under their supervision, and the steps involved can be rethought and redirected considering the differences and challenges of each sector, taking into account since each one of them has its specificities, and they need actions and decisions according to their administrative, business and managerial demands.

The new technologies must be included in the action plan developed by the area's management, seeking new knowledge that can introduce professional performances appropriate to the complexity of the environment and the organization's decision levels. In addition, it is necessary to assess which skills should be required of professionals in order to understand how they contribute to the organization through their experience and knowledge. In this perspective, it is important to define what type of evaluation will be demanded from the employee, because, if it is for performance, it is the work itself, according to the results achieved. On the other hand, if it is by competences, the organization will be able to measure with greater
particularity the individual competences inherent to the position or function that the professional will occupy.

Brandão and Guimarães (2001) present distinctions and particularities between performance management and competence management, observing situations with the mixture between these two elements, performance and competences. This combination can present a competitive advantage for the organization by indicating the core competencies that can provide a high level of company capacity to differentiate itself in the business world. Management based on the competencies of individuals contributes to the development of attributions, promoting an increase in productivity and performance. Carbon et. al., (2009) draws attention to the importance of objectivity and clarity in the description of the survey of the skills used, in such a way as to avoid mistaken indications by employees that do not represent their real performance capacity. In this direction, it is understood that when delegating activities according to the appropriate competencies for each function or position, the probability of achieving organizational results is evident.

In this way, given the peculiarity of each individual who plays a certain role, this sum of management by performance and management by competence not only helps to monitor people’s results in relation to work, but also to boost and retain them, in the company, as catalysts of excellent results. In this bias, it is worth emphasizing that the manager has the fundamental attribution to identify the competences of his team members, mainly referring to technical and practical knowledge, skills with innovative attitudes. So, it is considered in this discussion that the executive secretary with his multiple competences, can be one of the collaborators of the process, and a differential in the organization.

The process of analyzing the professional’s competences must be planned, because, otherwise, it may cause inconvenience due to him taking on positions or functions contrary to his ability and technical, cognitive, among others, which may impair the progress of activities, and on the other hand, difficult to adjust. However, it is important that the organization provides a favorable environment for the performance of skills, and understands the differences in positions among its employees, especially in relation to customs, cultures and ideologies, in such a way as to understand that divergences of ideas are healthy. for the benefit of the organization, it is more necessary to monitor and promote actions that can provide integration between them. However, it is necessary to verify if the professionals’ goals are aligned with the company’s goals, aiming to guide them in the ideal direction if they are in disharmony with the institutional strategic guideline.

In this scenario, Silva (2010) indicates that the characteristics of the executive secretary regarding negotiation and interpersonal relationships minimize conflicts and generate harmony between managers and professionals in the organization. The author emphasizes that the ability to innovate, transform, act on changes and support the decision-making process of this professional is part of the organizational context. Otherwise Silva (2021, p.3130), indicates the need for the secretary to be “(…) connective, positioning himself and generating collective results, solving problems and not only identifying necessary skills, but
tuning them”. Thus, this professional is considered a differential in the process of management by competences, with the necessary conditions to develop activities that require negotiation, communication, integration, flexibility, innovation and organization.

On the other hand, the assessment of which skills are necessary for the actions are essential for excellence in the performance of activities, and in this context, this professional passes through several sectors that demand the respective actions, which need the support of an integrating element, with the other professionals. Lessa; Shell (2015, p.134) indicate that the executive secretary currently holds relevant positions in companies, such as: “(…) assistance to the executive in decision-making and service approvals, improvements in the overall performance of the organization, modernization of systems and information flows.” These authors point out management tools that can be used by the secretarial professional in order to identify problems and promote solutions in such a way as to support the executive in decision making. One of them is the Deming Cycle, PDCA - planning, development, coordination, evaluation, which is indirectly indicated in Figure 1, which presents the scheme of the competency management model, from another perspective, referring to the process to be implemented.

Therefore, it is stated that the executive secretary can carry out activities that are in his/her profile of advisor, manager, consultant, entrepreneur, accompanying and supporting the implementation of this model with actions to achieve organizational goals. With this perspective, it is worth noting that the middle area, generally, the radius of action of this professional, has the same degree of relevance, importance and demand of the final areas, since they are responsible for providing the necessary conditions for the performance of the end activities of organizations.

Although each professional is unique in their skills, it is important to note that the actions and development of work and activities must lead to a single direction, achieving the organization’s objectives.

2 EXECUTIVE SECRETARY, ORGANIZATIONAL AND PROFESSIONAL PERFORMANCE STRATEGY

The competencies identified and valued according to each position or function cannot remain static, it is necessary to reformulate and with that look for others that can feed back the organizational competencies. Mussak (2010) characterizes the need to understand which areas are adherent to the person. On the other hand, it emphasizes the aspects of the environment and value to be present in the actions in such a way that the cycle is completed.

In this model, competency management follows a direction with a view to mapping, evaluating and developing the tripod of competencies (individual, collective, organizational), developing a mapping with the survey of the needs of the sectors of the organization, so that they can develop and train the professionals and teams in order to achieve their general and specific results.

Silva (2009) reinforces that people management is a central part of an organization, but faces challenges such as competency management discussed in this chapter. The central cell is the professional
in the face of changes and transformations. In this scenario, people management drives “(...) companies to invest in their intellectual capital through strategies that provide satisfaction to their employees in order to encourage individuals to add value to the organization.” (SILVA, 2009, p.173)

In view of this, a reinterpretation of the Competency Model was produced in which Carbone et. al., (2009) explains that it is about the performance of individual and personal skills in such a way as to create and maintain organizational skills in order to achieve organizational goals.

Figure 1. Reinterpretation of the Competency-Based Management Model

ANALYSIS OF STEPS

Figure 1 - demonstrates the essential steps for a Competency Management model accompanied by actions and strategic perspectives indicated by the organization on its institutional guideline. The re-reading of the model was based on Guimarães et. al., (2001) apud Carbone , et. al., (2009) but with the inclusion of technological and innovation aspects. It is a dynamic and flexible scheme, which primarily looks at the organizational strategy plan, including the organizational mission, vision, goals and objectives. From this objective, it analyzes the competences demanded by the organization, inserting the technological and innovative ones, and with that the personal, technical, technological and individual competences of the collaborators are raised. Thus, it is possible to carry out the construction and integration of internal and external, individual, collective and organizational competencies shown in Figure 2 below.

Figure 2 - Actions for Internal and External Competencies

Source: Own authorship.
Therefore, it is possible to set goals, thinking about innovations and performance indicators. In this perspective, the current competencies are found, as well as the existing gaps related to the lack of competencies that are demanded by the organization, but are not developed. In this final phase, evaluation, monitoring, adjustments are applied to correct possible gaps, analytically returning to the initial stage, passing through all other stages, if necessary.

In view of the diagnosis of the gaps found, the action plan helps to identify internal and external competencies through selection and recruitment in order to minimize the deficit found in the mapping carried out. In this perspective, Carbone et. al., (2009) in which he indicates that the purpose of mapping is to identify those gaps that prevent the institutional strategy from being implemented. Thus, it is possible to produce action plans and establish goals, innovations and performance indicators that will promote the reduction of errors. Strategic integration with management takes place with the alignment of individual, collective and organizational competencies.

After completing all the steps, it is important to assess whether the process was developed without failures or whether there is a need for adjustments in relation to the results achieved and the desired ones, in order to correct eventual failures in the route. The implementation of a competency-based management model requires complex and difficult steps to execute, with challenges that profoundly impact the entire chain of people in the company, even if senior management provides the necessary means and support at all stages of implementation.

Competency management requires a robust and in-depth analysis with the support of management tools, for example, PDCA of the competencies demanded by the organization cited by many authors in the area. In this idea, the area of people management, planning and logistics plays an important role in this competency-based management model, as it helps to facilitate the indication of the organizational strategy together with the model implementation team.

In any case, the participation of senior management is essential for the deliberation of the appropriate models and the resources or means necessary for processing and executing the plan. In this way, it is possible to get involved in the other hierarchical levels (VIEIRA, 2003). After all, resistance may arise due to the fears of employees, and they need institutional support and incentives from managers for the full development of the aforementioned competency management plan aligned with performance management.

2. 1 IMPLEMENTATION OF MANAGEMENT BY COMPETENCES WITH THE SUPPORT OF THE SECRETARY.

The implementation of the competency-based management model can be carried out with the support and participation of the executive secretary based on their technical and experiential knowledge of the company in which they operate. First, through the understanding of the referred management, the knowledge acquired in the academic world, and through research on the subject. Second, because the
professional has access to all hierarchical levels and in the company’s units, as stated by Coutinho (2018), “(...) the executive secretariat manages to cover all sectors of the organization, knowing their positive and negative points, contributions and deficiencies, which makes it able to make the connection between them when necessary (...)”.

As this type of management is based on mapping, assessment, development and monitoring, it is possible for the secretary to contribute to the survey of the skills that the organization needs to monitor the market, as well as to collaborate in the development of the process of selection and recruitment of professionals, that can contribute to the goals of organizations. In addition, it can verify whether the selected professionals were assigned to the units based on their skills, including suggesting training and development necessary for the improvement of each one of them.

In this way, as a transforming agent it causes specific changes in the environment, in the sense of moving the actions of individuals towards the implementation of the management model. In turn, during the process, you will come across stable, reactive, proactive, creative, exploratory behaviors, which require relational and social skills to consider and agree on conflicts when necessary. Under such a scenario, each level, unit, professional has its role in the respective implementation, as this process may represent a threat to professionals who already work in the organization, and those who will join can become challenging to face unexpected situations, in this aspect the secretary has ability to face similar challenges.

According to Takeuchi and Nonaka (2008, p.122) Moving away from known habits can seem very risky.” On the other hand, the authors call attention to tacit knowledge, which in turn are part of professional competences, which are complex to identify, considering that they are subjective, and permeated by customs, beliefs, mental maps, among others, which are included the cognitive dimension of the person. In this perspective, it is worth noting that the executive secretary and the managers also influence the implementation process, and therefore they must rethink their behaviors, attitudes and interpersonal relationships. Considering that learning and knowledge are important to contribute to the development of activities and the achievement of the objectives proposed by the organization, understanding the performance of each element of this competency-based management model process is necessary to take advantage of and direct the role of each of them.

Therefore, in table 1, below, the steps are shown, as well as the performance of the implementation team, the executive secretary, and senior management, in this complex process that seeks competitive advantage by inserting the culture of innovation with broad approaches, aiming to ensure the maintenance of the company in the face of the dynamic and unstable market that imposes on organizations the promotion of actions that keep reviewing their methods and generating organizational competences.

In this perspective, an important issue is inserted in competencies, which it is believed can be added to competency management. These are the career anchors that were discussed by Schein (1978, 1996), based on the study he carried out with some students, observing that as the individual goes through evolutionary career phases, he gets to know himself better, being able to identify clearly what he really does with mastery and satisfaction. Considering that the author indicates skills, values, attitudes in this process, it is possible to insert these dimensions in the work of training people to improve management by competences. For, mapping has the role of providing moments with employees in order to use management tools that can contribute to this action, such as: design thinking, SWOT matrix, among other management tools.

From the perspective of Schein (1996), with the addition mentioned by him, of the anchors, service and dedication to a cause, pure challenge and lifestyle, it can be inferred that from the recognition of these elements, it is possible for the individual to make choices career successes. In this bias, the process of mapping competencies can follow this conception of which career anchors each professional recognizes to have.

Therefore, understanding each one of them, their meaning and context, is to be able to understand which ones can provide their well-being and what is required in their function or activity, and contribute to
the decision on the adequate capacity of the individual in the units, projects or activities that need to be developed, executed, produced. The delegation of competence combined with the professional's vision of what he likes to develop can guarantee the retention of knowledge and allow the collaboration of intellectual capital to innovate on the company's processes and business.

in Chart 2, which shows that professional anchors are linked to social, technical, individual and organizational skills, as creativity, innovation, complex activities, interpersonal and group relationships, concern for the neighbors and society, as well as functional stability.

In this perspective, each career anchor indicated by Schein (1978,1996) is presented, based on the respective author, and on the perception of the author of this chapter, in which it can be observed that for each anchor there are several competencies related and inserted both in the organizational context and in the individual and personal context of the employee, as well as the type of profession that is linked to their meanings.

Source: Adapted from Schein (1978, 1996).
Considering the dimensions of competencies found in Schein's (1978, 1996) career anchors, one more anchor is included, the technological one, which can be understood as acting in digital activities and technological solutions. It is also inferred that this technological anchor can be considered as the activities related to the actions of information and knowledge management, as well as information technology, in which the professional will be able to recognize his performance in the systematization of processes, innovation of the business with digital transformation and disruption, artificial intelligence, among others. In fact, these perceptions are still being studied and researched by this author with a bias towards professional competences based on the reflection of the anchors presented by Schein (1978, 1996).

The essence of this thinking is anchored in innovation as a differentiating element in current organizations, given that the technological revolution promotes complexity, challenging goals and, at the same time, administrative and business modernization on a large scale. In this way, we dare to discuss this anchor that is currently demanded and indispensable by all companies, in view of the digital world that is increasingly accelerated due to the demands driven by the competitive market and require complex skills in the universe of disruption and digital transformation, which are aimed at actions that depend on people's approach and technological feasibility.

Thus, it is worth noting that software, programs, platforms are part of the strategies and solutions of organizations to achieve their goals with market competitiveness. In this way, innovation is considered to be present in this space, which is built through the creativity and entrepreneurship of its employees. On the other hand, it is worth mentioning that ABES (2018) apud Parada; Golin (2018), reports the high number of software developed in the country. Given that, Stop; Golin (2018) emphasize that from this perspective, innovations increase, and the trend is the evolution of the information technology market. Okano et. al., (2019) in turn notes that in the face of these changes, processes will be modified, and consequently new actions and models will be needed, as well as investment flows based on market and customer demands. In this bias, the digital element should be inserted into the company's internal perception related to all business and service approaches.

Companies and people are increasingly dependent on the support of digital resources, considering that it significantly reduces the time and costs involved for some activities, such as: meetings through videoconferences, communication by corporate digital groups, among others. In these scenarios, technological tools are necessary in the management processes, in any direction. One example is competency mapping, which sometimes requires software capable of storing large data to monitor indicators. So, having a qualified professional or knowledgeable about these technologies, and hiring an information technology development area, who can understand what the management area needs to be able to develop a system for this activity considered essential for the company is essential.

In the evaluation process, the respective professional anchors are very important to identify the professional's list of competencies, but with guidance on what is really important to perform and develop. Thus, it is possible to adjust the number of people according to the positions or functions that require...
activities that employees do not recognize themselves doing. These are situations that need to be analyzed, as well as procedures, processes, or competencies that were not properly planned or used.

On the other hand, it is the opportunity to evaluate, identify and record tacit knowledge, which has not been recorded and can contribute to the organization, as it is often not used because the lack of knowledge of this domain is not documented, as well as the professional's ability to other areas that have not yet been tried or performed. Strauhs (2012) emphasizes that generating knowledge increases productivity and efficiency in companies. In addition to observing that competency management combined with knowledge management by some companies, confirmed better performance in performance.

In this scenario, the importance of the competence mapping process is highlighted, from the performance evaluation combined with competence evaluation, considering that its absence may cause intangible damages to the company. Thus, Chiavenato's (2009, p. 247-248) understanding of the advantages of performance evaluation stands out, which identifies “(...) problems of supervision of personnel, integration, from the employee to the organization or to the position he occupies, dissonances, wastage of employees with higher potential than what is required by the position, motivation, etc.”

Thus, it is understood, when an employee spends more time to perform an activity than another could spend less time, it is a loss that occurs due to the waste of time. On the other hand, when exercising a competence that is not within its domain, a negative or unexpected result may occur for the organization. Thus, this process of analyzing competencies according to activities, positions and functions must be continued in the organization that intends to achieve its objectives without fail and with excellent results. However, it requires careful analysis and action to avoid praising employees at the expense of others with different abilities. In addition, it is important to have a problem-solving proposition in which the executive secretary can indicate actions that other employees can improve their skills and acquire others. On the other hand, promote actions to raise awareness, disseminate and share knowledge.

It is important to highlight the difference between training (to apply knowledge immediately) and development (provides learning generating new skills) commented by Chiavenato (2004). In this bias, it is observed that even the training methods must be analyzed in order to choose the types that are coherent with the demands and needs found in the organization. Knowledge management is a key element in this process, as it requires the sharing of experiences as well as learning. Given this, Strauhs (2012) indicates that it directs the appropriate and efficient way to identify the existing knowledge in the company. Thus, the promotion of events, in which each employee can share information with other colleagues, is a way of disseminating new knowledge, and building organizational and collective competences, which are built from individual competences. According to Strauhs (2012), the manager must have mastery over the knowledge management process, considering that he can modify the internal actions of the professionals. In addition, it is possible to more accurately detect the trends that each employee has in relation to services.

This exchange of knowledge must be monitored in order to balance it with coordination by managers responsible for the respective process. Well, it is a very complex process that requires good guidance to
avoid misguided views and actions about errors and failures of employees. In addition, the entire process must be based on the strategic objective of the organization, so it is necessary to effectively follow the steps to verify that no changes have occurred during the implementation.

3 THE EXECUTIVE SECRETARY AND THE CHALLENGES IN SUPPORTING THE IMPLEMENTATION OF MANAGEMENT BY COMPETENCES.

The challenges for implementing competency management are extensive and complex to overcome, as they directly impact the actions that must be carried out. In view of this, the executive secretary, with his ability to share and act in various activities and units, will be able to contribute at the strategic level in such a way as to disseminate his support in this endeavor. In addition to being the intermediary between the implementation team and senior management, which will provide all the necessary inputs and surroundings for the feasibility of the execution. It can also demystify the idea that customs and values are permanent, indicating that they can be remodeled according to each situation and moment. On the other hand, it can contribute to raising awareness about the importance of the respective mapping, considering that according to Leme (2005) it is necessary to have intense awareness about the new model in the organization. In this perspective, the thinking of D’elia and Camargo (2013) is presented, on the integration of the secretariat with the sectors for the development of processes.

The secretarial professional inserted in the process symbolizes that the strategic level is in accordance with the actions for implementation. However, a robust investment is required for this type of model. Barbosa (2008) mentions the difficulty of obtaining unrestricted support from senior management, given the need for large investment in the strategies that must be implemented during the process. Thus, it is important that the strategic level formally indicates how much and when it intends to invest in the respective action. On the other hand, it is necessary to align all management levels of the company, and the professionals qualified for such action.

The executive secretary, as a member of this team, must recognize which are his/her competencies that will be able to collaborate in the referred process of implementation of the competency management. The alignment between the strategic guideline and the competencies that can be used and developed is a great challenge to breaking the existing paradigms and culture. In turn, it is important to reiterate that employees have support from the strategic level, aiming at actions that encourage the desire to collaborate with the institution and develop good works. In this way, people management plays an essential role in the process, as it will outline policies aimed at the integration of ideas and support between units. In this vein, it is worth noting that the model discussed in this chapter was considering its breadth, the competencies developed and managed by organizations, “(...) scarce, valuable, difficult and costly elements and imitation and replacement”. (CARBONE et al, p.33).
4 STUDY METHODOLOGY

This research had a qualitative approach, with an exploratory bias, through a review of books, studies, and works on the subject. This section presents the methodological procedures used, and the limitations of the method used.

Considering that the main objective of this research was to qualitatively discuss the actions for the implementation of management by competencies with the participation of the executive secretary, examined by the theoretical structure pointed out, which permeate the reflections. It was decided on the qualitative research method, of an exploratory nature, which is considered more suitable for the intended analysis, in which Flick (2009) confirms that qualitative research is based on multiple theories with discussion methods. On the other hand, Gil (2008) points out that exploratory research provides a holistic view of a given subject, and qualitative analysis is based on interpretation.

From this perspective, the research was planned in stages. As for the means of investigation, a bibliographic survey was carried out based on the selection of studies based on the keywords, considering that they are indicative of the subject, and through qualitative procedures with an interpretative bias. From the qualitative approaches, we opted for the discussion around the subject based on the researched authors, through the interpretative analysis of the author of this study. Cervo and Bervian (2007) understand the possibility for the researcher to analyze and correlate facts or phenomena without handling data.

As for the limitations of the method, we can mention the analyzes performed by this researcher, which are subjective and subject to other perceptions and understandings. However, it is a study that encourages new research on the subject aiming at the dissemination of knowledge and participation and secretarial practice in the competence management process.

5 FINAL CONSIDERATIONS

The study shows that management by competencies added to management by performance, and aligned with actions inherent to knowledge management, observing important aspects to its implementation, which provide the identification of individual competencies that can generate organizational competencies, and consequently, integrated in them to the actions to achieve organizational objectives. In addition, it points out the need to analyze the ideal position of the professional in the organization, in such a way that it can create relevant capacities for the solution of the organization's problems. Thus, added to the self-knowledge of the internal or external collaborator regarding their professional anchors, it can contribute to the analysis of the best capacity of the professional in the position or function. On the other hand, the view of the authors who discuss this subject corroborates the propositions that drove this study.

It is also worth mentioning the evidence pointed out about the performance and effective participation of the executive secretary in the context of the implementation process of the respective
competency management model with the support of other management dimensions mentioned during the study.

However, despite having been demonstrated through the literature in the area, that the implementation of management by competencies together with management by performance, subsidized by actions of knowledge management, can provide the transformation desired by organizations regarding the achievement of their objectives with the development and adequate positioning of the competences of its collaborators, it is understood as a limitation of the research, that the respective result has not been demonstrated in practice.

Therefore, in addition to analyzing the subject from the perspective of the theory of the authors of the area, as carried out in this study, further studies are indicated aiming at deepening of the aforementioned theme to investigate the relevance of the participation of the executive secretary professional in specific contexts with the application of a case study that offers several possibilities of techniques aiming at a survey on the perception of the secretaries and managers responsible for the implementation of this type of model in organizations with experience in the subject, and that have in their staff the respective professional acting.

ABSTRACT

Folic acid supplementation to prevent neural tube closure defects is recommended as part of prenatal care. The guidelines recommend administering 400μg daily of FA, and this dose cannot exceed 1000μg daily. However, it is not uncommon to encounter cases in which the intake of FA exceeds the recommended doses, which is a worrying reality since the effects resulting from the chronic use of high doses of this vitamin are not yet fully understood. A broad analysis of the literature pertinent to this theme from the last 10 years, was verified and 09 articles were selected. Some of the harms that may be associated with excess FA in prenatal care include increased risk of developing childhood asthma, as well as upper airway infections and wheezing; exacerbation of B12 deficiency; fetal growth impairment; influence on brain development (autism); allergic reactions (eczema); cancer promotion (breast tumor and colorectal adenoma); increased insulin resistance in children; and risk of gestational diabetes. This study warns about the importance of the adequacy of the SUS in providing FA tablets at the appropriate dose for pregnant women since the tablets offered by SUS are at a dose of 5mg, which is approximately 10 times higher than recommended.

Keywords: Folic acid, Dietary supplementation, Prenatal

1 INTRODUCTION

Folic acid (FA) plays an important role in nucleotide synthesis and DNA replication, and its deficiency primarily affects rapidly dividing tissues (ULRICH and POTTER, 2006). FA deficiency in fetuses is associated with a variety of disorders, including defects in neural tube formation, resulting in fatal anencephaly or spina bifida, with varying degrees of impairment (BURDGE and LILLYCROP, 2012). In pregnant women, it can lead to anemia, since the demand for folic acid increases during pregnancy (BRASIL, 2013).

Folate is directly related to the prevention of neural tube defects, as well as the prevention of other diseases such as cardiovascular problems, Alzheimer's disease, some types of cancer, among others. Several studies have shown that this vitamin can help in decreasing plasma homocysteine concentrations, reducing acute myocardial infarction and cerebrovascular diseases. Folate deficiency can be caused by different conditions, such as a low folate diet or decreased absorption, for example, from alcoholism. Certain
condition such as pregnancy or cancer result in increased rates of cell division and metabolism, implying an increase in the body's demand for folate. Some medications can also contribute to this deficiency, such as trimethoprim, methotrexate, anticonvulsants and birth control pills. A folate-deficient diet can lead to the development of megaloblastic anemia after four months, in addition to potassium deficiency (ALABURDA and SHUNDO, 2007).

Supplementation with FA is a strategy for the prevention or treatment of developmental defects. Therefore, supplementation in pregnant women is related to the search for reducing the incidence of neural tube defect (NTD), which is the most common congenital malformation during pregnancy. The supplementation of PA during pregnancy was initially proposed in 1964, with this objective (BURDGE and LILLYCROP, 2012).

Several countries have regulated PA supplementation 3 months before conception and during the first trimester of pregnancy with a dose of 400µg daily, which can be increased to 5mg daily if the woman has a previous history of having a child with this malformation (BURDGE and LILLYCROP, 2012). Since the implementation of fortification, the number of NTDs has decreased significantly (MURRAY; SMITH and JADAVJI, 2018).

According to the Brazilian Ministry of Health, folic acid supplementation to prevent neural tube malclosure is recommended as part of prenatal care and should be started in the preconception period, at least 30 days before the date on which it is planned to become pregnant, and maintained throughout pregnancy (BRASIL, 2013). In Brazil, until 2012, the daily use of 5mg of folic acid was recommended until the end of pregnancy. However, currently, the guidelines emphasize that 400 µg of folic acid daily should be administered to all women until the end of pregnancy, and this dose cannot exceed 1000 µg daily (BRAZIL, 2013). However, it is not uncommon to come across cases where folic acid intake exceeds recommended doses. Therefore, both mother and fetus are exposed to excessive doses of folic acid, which is a worrying reality, since the effects resulting from the chronic use of high doses of this vitamin are still not fully understood (ULRICH and POTTER, 2006).

Higher doses of PA are recommended in some special situations, such as: women with diabetes (VALENTIN et al., 2018), epilepsy (BJORK et al., 2018) and a history of NTD (ASADI-POOVA, 2015). In these cases, it is recommended to take a daily dose of 5000µg of PA (NAVARRETE-MUÑOZ et al., 2015). Obese women also need higher doses of PA supplement. Association guidelines in the UK, Australia and New Zealand advise a higher dose of PA for obese women, while in the US and Canada the guidelines do not make a recommendation on this matter. Interestingly, in the US, fortification of foods with folate is mandatory, while in the UK, Ireland and other European countries it is voluntary. The recommendation for obese women in Ireland is a dose of 5mg per day, which is available on prescription, although there is little evidence in the literature to justify this specific dose (O’MALLEY et al., 2018).
Epidemiological studies have shown that a significant number of women who supplemented with PA during pregnancy exceeded the tolerable limit recommended by the Brazilian Ministry of Health of 1,000μg/day (HOYO et al., 2011; WEST et al., 2012).

The clinical significance of chronic or high intake of PA is not well established. Therefore, concern has arisen regarding the potential health effects, as in addition to fortified products, there is also widespread use of supplementation, including vitamins used in prenatal care, as well as energy drinks that are fortified with various vitamins. High intake of supplemented PA, along with food fortification, resulted in elevated red blood cell folate values among pregnant women and women of reproductive age (LAMERS et al., 2018).

Results from several studies suggest that FA supplementation can induce aberrant patterns of DNA methylation, and mechanically play a role in carcinogenesis (ULRICH and POTTER, 2006; BARUA; KUIZON and JUNAID, 2014). However, a meta-analysis performed with 50,000 individuals evaluated the effects of PA and demonstrated that PA supplementation does not substantially increase or decrease the incidence of cancer (VOLLSET et al., 2013). Furthermore, supplementation with AF-containing prenatal multivitamins has been seen to be associated with a significant protective effect in pediatric cancers such as: leukemia, pediatric brain tumors, and neuroblastoma (SINGER et al., 2016).

Although controversial, over-supplementation is involved in certain chronic diseases and does not reduce cardiovascular disease (SAUER; MASON & CHOI, 2009). Furthermore, acute folate intake also results in downregulation of folate transporters in the kidney, causing a dysregulation in the process of renal folate uptake (THAKUR et al., 2014). Several randomized and observational studies have suggested that maternal multivitamin intake with AF during pregnancy may modulate pregnancy-related outcomes (TIMMERMANS et al., 2009; CATOV et al., 2009; CATOV et al., 2011) including outcome in offspring development.

In order to evaluate publications related to folic acid supplementation during pregnancy and possible consequences associated with excess folic acid, a comprehensive review of the literature relevant to this topic was performed. Given that there is no benefit from an intake of PA above the recommended dose, the current dose of PA from supplements offered by the SUS should be reassessed.

2 METHODOLOGY

A systematic review study was performed based on the preferred criteria. reporting items for systematic reviews and meta-analyses (PRISM), in October 2020, using the following MeSH descriptors (https://decs.bvsalud.org/) associated: “folic acid” AND “dietary supplementation” AND “prenatal”. Research from meta-analyses, systematic reviews, original studies and clinical guidelines were selected. The searches were performed by the VHL (http://brasil.bvs.br/) in the MEDLINE (https://medlineplus.gov/) and LILACS (https://lilacs.bvsalud.org/) databases, in publications of the last 10 years, in Portuguese and English.
2.1 INCLUSION AND EXCLUSION CRITERIA

Studies of pregnant or preconception women and children whose maternal supplementation with folic acid during pregnancy was known were included. The intervention evaluated was the effects of excessive folic acid supplementation during pregnancy.

Studies with animal models, duplicate articles, incomplete texts, and those not available in full online, as well as opinion articles and articles that deviated from the proposed theme were excluded.

2.2 DATA EXTRACTION AND RISK OF BIAS

The following data were extracted from each study: authors and year; study design; sample size; objective; effects of excess folic acid. The title and abstract of each search result were screened by two reviewers who independently applied the same inclusion and exclusion criteria. There was no dissent.

3 RESULTS

A total of 520 articles were found in the VHL (03/10/2020) when the descriptors “folic acid” AND “dietary supplementation” AND “prenatal” were used in association. After inserting the following filters: articles from MEDLINE and LILACS, in Portuguese and English, full articles and articles from the last 10 years, as well as the main subjects: folic acid, prenatal care and nutritional supplements, a total of 258 articles were selected for reading titles and abstracts.

After reading the title and abstracts, 221 articles that did not describe excess folic acid were excluded. And later another 14 articles were excluded because they were studies with animal models. A total of 23 references were selected for full-text evaluation, with 9 articles being selected that described the consequences of excessive PA during pregnancy.

The flowchart for the search strategy is shown in Figure 1, and the selected articles are shown in Table 1.

4 DISCUSSION

Several studies agree with regard to the ideal dose of folic acid that should be used in supplementation during pregnancy (ULRICH and POTTER, 2006; HOYO et al., 2011; BURDGE and LILLYCROP, 2012). The WHO and the Ministry of Health (BRASIL, 2013) recommend a daily dose of 400 micrograms in order to avoid complications such as neural tube malformation, low birth weight and anemia during pregnancy. However, the Ministry of Health recommends different doses: 400µg/day for pregnant women, 1000µg/day in special situations during pregnancy – multiple pregnancy and 5mg/day for epileptic pregnant women (BRASIL, 2013).

The large number of pregnant women using high doses of PA may be related to medical reasons, as women with diabetes, epilepsy or a history of NTDs before pregnancy are recommended to take doses of 5mg/day (NAVARRETE-MUÑOZ et al., 2015). There are also reports of increased doses of PA as prevention of oral clefts (WEHBY et al., 2012). The use of these high doses of PA are unnecessarily continued after the third month of pregnancy (NAVARRETE-MUÑOZ et al., 2015).

The guidelines of some countries, such as Ireland, advise a higher dose of PA for obese women (5mg/day), although there is no evidence in the literature to justify this dose. It has been observed in studies that obese pregnant women have a lower level of maternal folic acid and vitamin B12 than women with a normal BMI (O’MALLEY et al., 2018; WEN et al., 2018). The authors also guide vitamin B12 supplementation in obese women to prevent NCDs.

To determine the effectiveness of high-dose folic acid for preventing preeclampsia in women with at least one pre-existing risk factor: hypertension, gestational diabetes (type 1 or 2), or a body mass index ≥35, a double-blind, multicenter, randomized controlled trial in 2464 pregnant women between 2011 and 2015 (1144 for the folic acid group and 1157 for the placebo group). Women were randomly assigned to receive either high-dose daily folic acid (four 1.0 mg oral tablets) or placebo between eight weeks and 16 weeks' gestation until the end of pregnancy. Folic acid supplementation at 4.0 mg/day in the first trimester did not prevent preeclampsia in women at high risk for this condition (WEN et al., 2018).

A study among pregnant women in Spain showed that the majority of women did not follow the recommendations of 400µg/day of PA during pregnancy, using doses below or above the recommendation. More than half of the women used low doses of PA in the first and second period of pregnancy, due to previous pregnancy, smoking, alcohol consumption, unplanned pregnancy and no history of miscarriage. While 29% and 17% took high doses of PA, in the first and second period of pregnancy respectively, due to alcohol consumption, unplanned pregnancy and history of miscarriage. Public health strategies should be designed to raise awareness of the appropriate perception of PA use and to encourage healthcare professionals to avoid using PA dosages above or below current recommendations. (NAVARRETE-MUÑOZ et al., 2015).

The considerable number of women who do not use PA can be explained in part by the fact that they were not aware of being pregnant and therefore were not informed of the benefits of PA in early
principles and concepts for development in nowadays society: Excessive supplementation with folic acid during prenatal care: literature review

pregnancy. However, when women are aware of pregnancy and the benefits of PA, they increase PA use, particularly in the second and third month of pregnancy (NAVARRETE-MUÑOZ et al., 2015).

AF is already added to foods for fortification in addition to the naturally occurring folate in foods. Thus, if FA supplements are also taken during pregnancy, the mother and fetus may be exposed to FA in excess of the recommended upper tolerable limit of 1,000µg/day for adult pregnant women. In the SUS, the dose of PA provided to the population of pregnant women is one tablet containing 5mg. This dose is above the dose recommended by the Ministry of Health of 400µg/day. Which exceeds the tolerable upper limit by 5 times. Thus, given the possibility of harm and the lack of proof of its efficiency when used in high doses, it is necessary to review the indication of excessive doses, especially those above 1,000µg/day.

For a better understanding of the effect of PA supplementation on pregnant women, we systematically reviewed the recent literature (2010-2020) in order to assess the health outcome of newborns and pregnant women. The limited number of studies included in this review, as well as the heterogeneity of their methodologies (Table 2), are the main limitations of this work. The literature review was difficult due to the inconsistent application of the term supplementation, which does not indicate high doses of PA consumption, and the application of the term “high”, which has different interpretations.

Of the 23 pre-selected studies, only 09 were included in the review, as they met the inclusion criteria, the other 14 studies did not report the effects of excess folic acid, therefore they were not included at the end of the review.

Of the 09 selected studies, 03 studies (DUNSTAN et al., 2012; VALERA-GRAN et al., 2017; HUANG et al., 2019) are prospective studies and 01 study (PARR et al., 2017) is a cohort study; these study models present better levels of scientific evidence. Four studies were selected (BARUA; KUIZON and JUNAID, 2014; ASADI-POOVA, 2015; MURRAY; SMITH and JADAVJI, 2018; VALENTIN et al., 2018) of literature review and 01 Workshop (LAMERS et al., 2018) between countries.

Two studies were excluded (HOYO et al., 2011; NAVARRETE-MUÑOZ et al., 2015), as they only describe which population ingests high doses of PA. Two randomized controlled trials (WEHBY et al., 2012; BORTOLUS et al., 2014) were excluded. These studies have a strong power of experimentation, but they are not yet finalized. Most studies (SAUER; MASON and CHOI, 2009; PAPADOPOULOU et al., 2013; CZEIZEL; VERECZKEY and SZABÓ, 2015; SINGER et al., 2016; SCHMIDT et al., 2017; ALFONSO et al., 2018; GOODRICH et al., 2018) describe only the benefits of PA intake. Two other studies recommend high doses (HUHTA and LINASK, 2015; BJØRK et al., 2018), for preventing heart
problems, and two other studies (O’MALLEY et al., 2018; WEN et al., 2018) demonstrate that higher doses for obese women do not show great results.

4.1 EFFECTS OF EXCESS FOLIC ACID

Regarding the abusive use of folic acid, there is great uncertainty among the authors about the potential harmful effects that this vitamin could have on the health of the mother and the fetus when in excess. Some of the harm that may be associated with this excess are an increased risk of developing childhood asthma (PARR et al., 2017; LAMERS et al., 2018; VALENTIN et al., 2018) and the risk of upper airway infections and wheezing (PARR et al., 2017) in early childhood. In addition, studies indicate that excess folic acid promotes dysregulation of the process of renal folate uptake (BARUA; KUIZON and JUNAID, 2014).

The high concentration of folate after fortifications may be influencing other normal biological processes, such as: aberrant patterns of DNA methylation (BARUA; KUIZON and JUNAID, 2014) and masking maternal vitamin B12 deficiency. Vitamin B12 deficiency is associated with impaired fetal growth (LAMERS et al., 2018) and irreversible neurological damage if not correctly diagnosed and treated (ASADI-POOVA, 2015; VALERA-GRAN et al., 2017).

Excessive PA during preconception has also been associated with behavioral problems in children (VALERA-GRAN et al., 2017). The study by Valera-Gran et al., 2017, suggests that the ingestion of high doses of PA can cause neurocognitive problems; and corroborating with other studies, it can cause autism (LAMERS et al., 2018; MURRAY; SMITH and JADAVJI, 2018).

Other theoretical risks are allergic reactions and eczema (DUNSTAN et al., 2012) as well as carcinogenic effects, since PA supplementation can increase the speed of proliferation of pre-neoplastic cells and subclinical cancers in pregnant women (BARUA; KUIZON and JUNAID, 2014; VALENTIN et al., 2018).

More recent studies demonstrate changes in the pubertal stage in children aged 13.5 years; increased insulin resistance at 9.5 years and 13.5 years (MURRAY; SMITH and JADAVJI, 2018); change in lipid profile in the second trimester and risk of gestational diabetes (HUANG et al., 2019).

The main effects of excess folic acid after reviewing the literature are described in table 3.

Since folate levels can influence DNA methylation, further studies are needed in the future to explore the systemic differences in DNA methylation profile in relation to time and dosage of FA supplementation between different populations and between genders (BARUA; KUIZON and JUNAID, 2014).

Huang et al., 2019 showed that most women take PA for a longer period, instead of following the recommendations of taking 400µg/day of PA for 3 months before pregnancy until the end of the first trimester. It was observed that duration or different periods of FA supplementation are associated with a higher risk of gestational diabetes when FA was taken for more than 90 days. It was also observed in this study that non-supplementation with PA during the prenatal period is related to the incidence of gestational diabetes. Thus, not taking AF or taking AF for a longer duration may not be safe for pregnant women (HUANG et al., 2019).

The high intake of PA is related to Caucasian race, advanced maternal age and complete higher education (HOYO et al., 2011), as they represent greater resources for access to PA supplementation, suggesting the need for reeducation in the entire population about the use of AF currently recommended.

Concern about the appropriate dose and potential side effects is still a matter of debate. As maternal FA supplementation has the potential to induce epigenetic effects in the offspring genome, which may vary with the individual's metabolic capacity, race, sex, geographic location or interactions with other nutrients, a possible reason for inconsistency between studies could be due to differences in the study design. In the future, there is definitely a global need for collaboration to accumulate scientific evidence from a clinical perspective, and to interpret these interventions and potential effects (BARUA; KUIZON and JUNAID, 2014).

4.2 CLINICAL CONSIDERATIONS

Folate deficiency, a treatable condition, remains a public health concern. It should be known to everyone that 400µg/day of PA initiated 4 weeks before and up to 12 weeks after conception is effective. The exception is made for women with diabetes, epilepsy and a history of defects in the formation of the neural tube, who are recommended to take a daily dose of 5mg.

The PA pills offered by the SUS characterize an overdose. That is, the recommended dose is 400µg/day, and the currently offered dose of 5mg/day is approximately 10 times higher than recommended. Therefore, the adequacy of the SUS in providing pills in adequate doses is important.

5 CONCLUSION

The data presented in this review show that women of childbearing age should use with caution and not exceed the Ministry of Health's recommended daily intake of folic acid, as there is considerable
evidence that excess folic acid can lead to potential adverse effects for both mother and for the fetus. The dangers of high levels of folic acid, whether obtained through supplementation or naturally, are still not well understood. Therefore, additional studies are needed to determine the most effective dose of folic acid, the upper limit of folic acid intake, and the timing of folic acid supplementation.

Public health strategies should be devised to raise awareness of folic acid use in pregnancy and encourage healthcare professionals to avoid using folic acid dosages above current recommendations.

ABSTRACT
Bioethics has the function of ensuring the well-being of people, guaranteeing and avoiding possible damages that may occur to their interests, and providing the professional and those who are served by him, the right to respect and will, respecting their beliefs and values. Objective: to highlight the bioethical principles and their application against Hepatitis B virus infection in the light of the literature. Methods: This is a review of mixed studies, published on the bases of the National Library of Medicine (PUBMED), Latin American and Caribbean Literature on Health Sciences (LILACS), and Scientific Electronic Library Online (SCIELO), in the chronological period between 2012 to 2022. Results: It was evidenced that chronic HBV infection is the main cause of Liver Cirrhosis and hepatocellular carcinoma and that vaccination is an effective way to change this scenario. The vaccine contemplates the bioethical principle of justice and scientific evidence supports beneficence, however, adverse effects interfere with non-maleficence. However, side effects result in conflicts involving the principle of non-maleficence. These consequences are intensified when they are associated with individual and/or collective factors, which can interfere with the individual's autonomy in adhering to such a prevention measure. Conclusion: The treatment and prevention of Hepatitis B should be widely discussed in association with bioethical principles, developing health actions that can guarantee the individual the principles of autonomy, beneficence, non-maleficence, and justice.

Keywords: Bioethics; Infection; Hepatitis B.
harmful to the future development of the humanity and for the maintenance of conditions in gives population (Zanella, 2018).

It can be understood as a means capable of ethically valuing and legitimizing human actions that may have an irreversible impact on the life events of the population, intending to resolve existing conflicts and moral dilemmas in the relationships and interactions between institutions, teams and environments, especially those related to the health of individuals (Schram, 2017).

Among the principles of bioethics are the principles of beneficence and non-maleficence, linked to actions that are capable of to promote good and avoid evil, the principle of autonomy, considering the patient as an active subject in the process therapeutic, and the principle of justice, related with the equality in treatment between you subjects (Drummond, 2017).

Faced with the problem of Hepatitis B virus (HBV) infection, this fact represents an important problem of public health, since it has already been able to infect approximately 2 billion people worldwide, being that around 350 million people with the disease progressed to Liver Cirrhosis and Hepatocellular Carcinoma, in addition to be responsible for about 1 million deaths per year and due to the complexity of treatment and follow-up, That question he can compromise at questions bioethics required for the case (Trepus, et al., 2014).

For O confrontation of that problem, The Assembly world gives Health adopted The first Strategy Global of Sector of Health on Viral Hepatitis, for the period 2016-2021. The strategy was aimed at eliminating hepatitis as a problem in health public. At the however currently at goals global defined for reduce at new infections per hepatitis viral in 90% and reduce at deaths attributable to hepatitis viral in 65% until 2030 (Hsu, & Chang, 2019).

In Brazil, during the period from 1999 to 2020, they were registered in the Information System of Notifiable Diseases (SINAN) 254,389 confirmed cases of hepatitis B (HB), being 34.2% in the Southeast region, followed by the South regions (31.8%), North (14.7%), Northeast (10.3%) and Central-West (9.0%). In this period, the highest detection rate was observed in 2011 (8.4 cases for 100 thousand population) and The smaller in 2020 (2.9 cases for 100 thousand population. It was evidenced predominance at the genre male (54.8%), age group from 25 to 44 years (49.0% of cases), self-declared brown color (42.7%) and in people who had in between the 5th and The 8th grade incomplete (17.0%). THE chronic form was found in 72.9% (Brazil, 2021).

Currently, vaccination against HBV is the most effective way to prevent infection, so it is used worldwide and facing the association as the principles of bioethics, where an important relationship of the bioethical principle of justice is evidenced, related to the right to access immunobiologicals. However, the adverse effects of the vaccine, arouses conflicts between the bioethical principles of beneficence and non-maleficence, which can intensify when associated with personal factors, relatives and/or community (Sugarman et al. 2017).
In this sense, HBV B infection assumes a relevant public health issue, requiring studies that present up-to-date data on the infection, clinical forms and complications, in order to intensify the actions of prevention and improve therapeutic strategies, associating them with the contemplation of bioethical principles, which must be addressed and insured to individuals (Hsu & Chang, 2019).

In this way, to highlight the bioethical principles and their application against Hepatitis B virus infection in the light of the literature.

2 METHODOLOGY

This is a systematic literature review study, carried out through a bibliographic survey using if data from secondary sources. Systematic review is a research modality, which follows specific protocols and seeks give some logic to a great corpus documentary (Galvão & Ricarte, 2019).

The guiding question adopted for this study was what is the application of the bioethical principles of autonomy, justice, beneficence and no maleficence in front of control of infection fur virus gives Hepatitis B with emphasis on vaccination?

The steps taken to put this review into operation were: 1.choice of the guiding question; 2- selection of studies composed the sample based on the inclusion and exclusion criteria of the research; 3- establishment of information that will be captured and classification of studies; 4- Analytical judgment of the articles included in the review; 5- critical analysis of included articles and discussion of results; 6- report of the review and synthesis of the information acquired in the course of the other steps.

Data collection was carried out from May 1 to 30, 2022 and For the selection of articles, the following were used. following databases: National Library of Medicine (PUBMED), Latin American and Caribbean Literature in Sciences of Health (LILACS) and Scientific electronic library online (SCIELO), using you descriptors/Mesh: hepatitis, infection, bioethics at the period chronological understood in between 2012 to 2022.

The inclusion criteria used were: available electronically for free, articles published in the Portuguese and English, full text with abstracts available and published in the last 10 years (2012 to 2022).

The criteria for exclusion were as follows: articles that did not answer the guiding question of the research and that they were duplicated in the many different bases of data.

After applying the aforementioned criteria, a total of 103 articles were found. After reading the intact From articles were selected 10 studies what answered the question guiding gives search.

| Painted 1. Selection From articles included in the study. |
|-----------------|----------------|----------------|----------------|----------------|----------------|
| 1st Search:    | Criterion 01   | Criterion 02   | Criterion 03   | Criterion 04   | Criterion n05  |
| Association From descriptors |                  |                  |                  |                  |                |
| TOTAL           |                  |                  |                  |                  |                |
After search, careful readings of the 10 selected publications were carried out to elaborate the present review. THE analysis From Dice he was carried out in form descriptive, proceeding The categorization From Dice extracted From studies selected in thematic groups, from the identification of variables of interest and key concepts, thus the Results were categorized in a table adjusted for this purpose containing the following items: author, year, journal of publication and title of the research, in order to provide a comparative analysis, so that they would enable The acquisition of answers to problem of study.

The research was not submitted to the local Research Ethics Committee (CEP), as it was a study based on sources. secondary and do not fall within the legislation of CONEP/MS, resolution 466/2012.

### 3 RESULTS

Table 2 shows the articles included in the sample that answered the guiding question proposed for the study, namely: what is the application of the bioethical principles of autonomy, justice, beneficence and non-maleficence in the face of infection control by the virus of hepatitis B with emphasis on vaccination?

Principles and Concepts for development in nowadays society: Bioethical principles and their application against Hepatitis B virus infection

The results shown in table 2 show that the 10 studies included in the sample were published in the years 2013 (2), 2015 (1), 2016 (1), 2017 (2), 2018 (2), 2019 (1) and 2021 (1). The studies were published in national and international journals and focused on thematic.

4 DISCUSSION

THE discussion constituted a corpus of study grouping you themes most addressed in the following categories: Epidemiological information of Hepatitis Virus Infection B and Bioethical Aspects applied against Infection by the Virus of Hepatitis B.

I- Information epidemiological gives infection by Virus gives Hepatitis B

It is estimated that approximately two billion individuals had previous contact with HBV and that the infection chronic disease affects approximately 350 million people worldwide, and may develop symptomatically, oligosymptomatic or asymptomatic, being the main cause of Liver Cirrhosis and Hepatocellular Carcinoma (HCC), in addition to in to be responsible 500,000–1,200,000 deaths per year in result in complications caused fur HBV, characterizing an important it's worrying problem of health public at the world (Trepus, et al., 2014).

According to the Ministry of Health (MS) 15% of the Brazilian population has previous contact with HBV, and about 1.5% are chronic carriers, most of whom are unaware of their carrier status, constituting an important factor in the virus spread. The occurrence of the disease may vary from region to region, according to the socio-economic situation. population, significantly affecting those who live in precarious and promiscuous situations (Brasil, 2010; Costa et al. al., 2013).

The epidemiology of this infection can be classified into three categories of endemicity: High, middle and low as the proportion of the population reacting to HBsAg. Data show that the Northern Region of Brazil is configured as the region with the highest prevalence of HBV infection, thus the Amazon is characterized by the region with the highest endemicity of the disease in the country, with the South region presenting the lowest prevalence, and the Central-West regions, North East and Southeast considered regions in prevalence intermediate (Nascimento, et al., 2012; Silva, et al., 2015).

In Brazil, there is an increasing trend of HBV towards the south/north regions, determining three patterns of distribution: high endemicity in the Amazon region, in some municipalities in Espírito Santo and in western Santa Catarina; intermediate endemicity, present in the northeast, midwest and southeast
regions; and low endemicity in the southern region of the country. A study carried out in the northern region, state of Acre, highlights the importance of horizontal transmission, such as dissemination and perpetuation of virus intradomiciliary (Lobato et al. 2006; Brazil, 2018).

The endemicity of HBV infection can be assessed by the prevalence of seropositivity of the markers serological tests, which indicate current or previous contact, and classifies it worldwide into three patterns: low (<1%), intermediate (1 to 5%) and high (>5%) endemicity. In regions with high endemicity, it is evident that perinatal and horizontal transmission are the most common forms of HBV infection, the latter being mainly in the first 5 years of life (Liaw & Chu, 2009; world Health Organization, 2009).

Thus, another study carried out in Acre, a region of high endemicity for the disease, showed that the reactivity to HBsAg and total anti-HBc in the population studied, showed a correlation with alcohol abuse, with the range older age, male gender, previous surgeries and the presence of tattoos were exclusively related to the larger reactivity to total anti-HBc (Silva et al., 2017).

The diagnosis of the disease includes examinations in a laboratory environment and rapid tests in order to characterize O infectious agent and your gravity disease and can be accomplished through serological tests that involve reactions immunological, which are able to determine the different phases of the infection classified as acute and chronic, immune or susceptible. The main serological markers related to HBV are Hepatitis B Surface Antigen (HBsAg), Total antibodies against Hepatitis B virus core (Anti-HBc) and Antibody against Hepatitis B Surface Antigen (Anti-HBs) (Brazil, 2009; Hermes Pardini, 2016).

Due to the severity of the problem, early diagnosis of the disease, rapid diagnosis of viral hepatitis and timely referral of infected people for treatment. Accurate and early diagnosis of these diseases allows an adequate treatment and directly impacts the quality of life of the individual, being still a powerful instrument in prevention in complications most frequent, as cirrhosis advanced and cancer hepatic (Brazil, 2016).

THE main form prophylactic for the combat the HBV and the vaccination what is it incorporated in the Brazil in nineteen ninety, initially for hyper-endemic regions, such as the Amazon region and from 1998 onwards it became universal at birth, being then incorporated progressively others tracks age up until what in 2016 all The population he was included regardless of age or risk factor, proving to be effective in preventing acute and chronic liver disease and its progression to cirrhosis and/or hepatocarcinoma is largely helpful in decreasing virus transmission. She must be administered at the neonate in the first 12-24 hours after O childbirth, or soon after to be exposed to virus, second the scheme vaccine two more applications are necessary within one month and six months after the first dose (Nunes, 2013; Brasil, 2014; Gomes, 2017).

In those countries what started in form routine The vaccination against O VHB since The decade in 80, you studies show changes in the endemicity profile of infection by this virus (Lok et al., 2016). In Brazil, the same trend is shown in works carried out) in the municipality of Lábrea, which show a reduction in the infection rate, which was 15.3% in 1988 to 3.7% in 1998, as well as in the state of Paraná, where a
study identified the impact of vaccination on reducing of the incidence of HB cases in the region, in the age group from 0 to 9 years, and confirmed the effectiveness of the vaccine as a measure of control of this grievance (Braga, et al., 2005; pudelco, et al., 2014).

It should be noted that children and adolescents represent a high risk group for infection by the HBV, mainly those of lesser purchasing power. In addition to vaccination programs against this infection, investment should be made in activities educational what address The importance in conclude O scheme proposed, in that sense reaffirms The importance in effectively develop immunization programs in schools, as the concentration of this population in the same place and period facilitates follow-up and control, thus ensuring the administration of the complete series of doses required for immunization against illness (Oliveira et al. 2007).

II - Aspects bioethics applied front The Infection by the virus gives Hepatitis B.

In a democratic and plural society, citizens can make independent choices, based on the correlation in between yours rights and duties. In this sense, The autonomy refers The perspective in what each to be human he must to be truly free. However, in our cultural universe, autonomy may not be limited to the patient, especially when treating them. whether of children, adolescents or other people with limited decision-making capacity, whose responsibility extends to others elements of the family, constituting the Autonomy Family (Nunes, 2017).

Sexually Transmitted Infections (STIs), including hepatitis B, are among the health problems that most afflict the world population, deserving the concern of health managers, since the times of ancient history. THE The individual's autonomy can make him susceptible to risky behavioral activities, such as early start of activity sexual intercourse, the promiscuity of partners and the sharing of personal objects, as well as intimate relationships without condoms. In order to intervene in these factors, the citizen must undergo guidance in public, academic and/or public health activities. family, making them aware of susceptible infections, as well as the perception of their responsibility as an “agent transmitter”. (NS, 2003).

Thus, evidence-based medicine (EBM) is based on the scientific literature of reference, which is based on the evaluation of different methodologies, resulting in the conscious and judicious use of the best existing evidence in clinical practice, that assists in decision making regarding a person's health care. However, EBM cannot interfere with the autonomy of patient after all the professional treats individuals and not illnesses (Nunes, 2017).

The HBV vaccine contemplates the bioethical principle of justice, associating itself with the doctrinal principles of the SUS (universality, completeness and equity). In addition from that, evidence scientific prove The efficiency gives said vaccine, exercising the bioethical principle of beneficence, however, does not rule out adverse effects, compromising the principle of non-maleficence. These conflicts can be associated with personal, family and/or community factors, which can interfere at autonomy of individual and/or responsible, influencing them The refusal of vaccine (Sugarman et al, 2017).
Compulsory immunization programs are morally justifiable, as vaccination is considered one of the more effective and cost-effective public health policies used in disease control and prevention, however, it is also one of the most controversial and controversial biomedical techniques, and can result in serious individual reactions. So being, becomes essential The Implementation in biopolitics compensatory, associated The reasoning bioethics, aiming promote a public awareness of moral responsibility, collective solidarity and justice social with children affected (Hsu & Chang, 2019; Lessa, 2013).

Per other side, for some authors, countries with laws proxies how much The use in vaccines as character mandatory, as is the case in Brazil, except for people with medical restrictions, may compromise the principle of autonomy, characterized as the respect for the subject's will, since the mandatory vaccination, deprives him of this right (Souza Of Jesus, et al., 2016).

Refusal of the vaccine by community members and/or religious leaders, requires an important approach from the Care Primary in Health (APS), then are trainers in opinion and influence negatively The autonomy gives person and/or responsible, consequently, if observe O increase at prevalence in infection fur HBV, making them susceptible The complications such as Liver Cirrhosis and Hepatocellular Carcinoma. Such situations decrease the patient's quality of life, so how, generate costs lofty to the public health (Hsu & Chang, 2019).

Although the autonomy of children and adolescents is recognized, they constitute a group that deserves attention. after all, they can use this principle in a wrong way, exposing themselves to risky situations that make them susceptible to HBV and others illnesses, in addition addition, some decisions depend of consensus of responsible, O which he can interfere accession gives vaccination (Shepard, et al., 2005).

Another principle of bioethics that may be compromised by the act of mass and/or mandatory vaccination is the of non-maleficence which means avoiding any type of risk, in relation to the safety of vaccine products, such as your correct application and storage, in addition to compromising the principle of justice which aims to resolve issues conflicts related to collective life, by having the imposition of collective benefit as argument for the levies individual (Souza Of Jesus, et al., 2016).

According to Lessa and Dórea (2013), principlist bioethics is not enough or sufficient to analyze the issues ethics associated at actions individual what has impact significant at health collective, as It is O case gives vaccination in pasta in children. conflicts in interests individual and collective, The distribution uneven in scratches versus benefits and The vulnerability of children open ways to the reflection ethics about the current Software of immunization .

Therefore, for bioethicists, the interest of collective health and the protection of the population must prevail over the autonomy of the individual, and it is up to health professionals to comply with the principles of beneficence and non-maleficence, since the cost/benefit of applying the vaccine is at stake, since, on the one hand, the aim is to prevent contagion and, on the other hand, to expose the patient to the side effects, and, from that, bioethics becomes inefficient for the critical analysis in this situation (Pereira, et al., 2018).
Therefore, HBV infection characterizes an important public health problem, which must be widely discussed in association with bioethical principles, developing health actions that can guarantee the autonomy of the individual and/or dependent, so as, exercise the beneficence, non-maleficence and justice (Gaze, et al., 2006).

On the other hand, with regard to access to immunizations, economic factors can be associated with non-compliance of a principle of bioethics which is that of justice, opening space for bioethical discussions on the social vulnerability of the greatest part of the population, who cannot afford these immunizations, when they are not available in the single system in health. (Moura, et al., 2021)

The benefits of vaccines for public health are indisputable, so bioethics can provide reflection and debate capable of understanding the complexity and conflict of the concrete reality so that the country moves towards a vaccination program that is not only ideal in its epidemiological, social, political and economic aspects, but also what be ethically acceptable, to avoid damage and sufferings in principle avoidable (Lessa & Schramm, 2015).

5 CONCLUSION

With this study, the information on the epidemiological and bioethical approach to the infection by the hepatitis B, recognizing that vaccination against HBV contemplates the bioethical principle of justice and, what evidence scientific studies prove the effectiveness of the aforementioned vaccine, exercising the bioethical principle of beneficence, however, the effects collateral, result in conflicts involving the principle of non-maleficence. These consequences are intensified when are associated with individual and/or collective factors, which may interfere with the individual’s autonomy in adhering to such a measure of prevention.

Therefore, The infection fur VHB represents a important problem in health public, needing in planning in health what intensify O investment in activities educational at Heads up Primary in Health, covering The discussion of bioethical principles, which can guarantee the autonomy of the individual and/or dependent, as well as exercise the beneficence, non-maleficence and justice.

In view of this, the authors suggest that further studies be carried out covering the topic in question, for greater comprehensiveness of results, as well as studies with other approaches for better dissemination of the theme, mainly among professionals of health.

ABSTRACT
With aging, diseases related to the musculoskeletal system tend to appear more frequently: arthritis, osteoarthritis, sarcopenia that result from changes in Activities of Daily Living (ADLs), complications in locomotion to death due to falls. According to DATASUS, hospitalizations and deaths in the elderly aged 60 years and over, in the period from January / 2008 - February / 2016, due to external causes of morbidity and mortality totaled 5,290, burdening public health costs and directly affecting the quality of life of individuals.

1 INTRODUCTION

With aging, diseases related to the musculoskeletal system tend to appear more frequently: arthritis, osteoarthritis, sarcopenia that result from changes in Activities of Daily Living (ADLs), complications in locomotion to death due to falls. According to DATASUS, hospitalizations and deaths in the elderly aged 60 years and over, in the period from January / 2008 - February / 2016, due to external causes of morbidity and mortality totaled 5,290, burdening public health costs and directly affecting the quality of life of individuals.

The elderly emerges from the moment when the organism enters the aging process, which is when physiological, morphological, and biochemical changes appear, also considering psychological changes when the human being adapts to new life situations (SANTOS, 2010).

Conceptualizing the elderly, we can have different points of view considering the location of where they are, whether in developed or developing countries. Thus, the United Nations (UN) conceptualizes the elderly, in Brazil, as being those who are 60 years old or more.

Quantifying in numbers, according to the Brazilian Institute of Geography and Statistics (IBGE, 2008) and considering the concept of elderly people by the UN, 11.3% of the Brazilian population is elderly, a number that according to statistics has tended to grow since 1999 to date the number has grown by more than 2%. Also, according to IBGE, the number of elderly women who have mobility problems (ability to walk 100 meters) is higher than that of elderly people, 15.9% against 10.9%, in compensation the life expectancy of elderly women is higher, 77 years against 69 of the elderly, which makes elderly women more susceptible to inability to move.

The practice of physical exercises can interfere with secondary aging factors, leading to healthy aging, with the advancement of technologies in the health area and the awareness of “good aging”, the elderly
population has been growing in the country, see data cited in the topic above, along with life expectancy, which leads to the need to be physically more active, to have greater independence in ADLs, and other daily activities, such as shopping, taking a walk, going to a doctor, among others (NEGRÃO; BARRETTO, 2010).

According to Moreira and Borges (2009), the regular practice of physical activities and the maintenance or acquisition of a good level of autonomy for the performance of activities of daily living, have an important relationship. They conclude that an active lifestyle can delay the impacts generated by the aging process. Keeping the elderly more independent in their daily activities

Recommendations for levels of physical activity according to the World Health Organization (WHO) for this public are 150 minutes of moderate aerobic activity or 75 minutes of vigorous aerobic activity, which can also be a combination of moderate and vigorous activities.

Of the most prevalent musculoskeletal pathologies in the elderly:

a) Musculoskeletal degenerative

According to Da Silva (2008), The concept of degenerative osteoarticular disease presupposes an abnormality in the hyaline cartilage, which determines symptoms of variable intensity and impaired function. The clinical picture is called arthrosis, osteoarthritis or, as it is currently preferred, osteoarthritis (OA). Still according to the author above, the main clinical manifestations are pain, joint stiffness and muscle edema. As for the place of manifestation, it differs between the sexes: among men it is more common in the hip region, in women it presents more frequently on hands, knees and feet.

b) Metabolic and musculoskeletal

Coelho (2009) reports that this pathological alteration affects the connective, muscular and bone tissues, generating several manifestations in the osteoarticular system. Among the cases of pain, the causes may not be exclusively due to wear and tear on the tissues that make up these joints and muscles, these can be triggered by systemic diseases (diseases that affect more than one organ or tissue) that manifest with osteoarticular symptoms. Among the metabolic ones that is most associated with the elderly is Diabetes Mellitus, considering the number of elderly people who have the disease.

c) Rheumatic musculoskeletal

Cecil (2011) points out that even though rheumatological diseases have quite different origins, the causes pointed out are frequent immunological disorders leading to local and systemic inflammation. According to Biasoli& Machado (2006), in rheumatological diseases, most complications occur in the joints, the primary joint injuries caused by rheumatism or secondary dysfunctions resulting from an abnormal effort in other structures can cause joint deformities, tendonitis, bursitis, etc. Among the most frequent pathologies, whether they are primary or secondary causes, are spinal dysfunction, osteoarthritis, osteoporosis, fibromyalgia, spondylitis syndromes, rheumatoid arthritis. In that regard

objective of the present study was to compare the prevalence of musculoskeletal symptoms between active and sedentary elderly women.
2 MATERIAL AND METHODS

2.1 STUDY SUBJECTS

The research was carried out with two groups of elderly women, one group composed of active women and the other composed of sedentary women. Both groups of elderly women are in the municipality of Feira de Santana - BA.

The selection criteria were:

a) Be elderly;
b) Female sex;

The option for the female sex was since most of the members of projects aimed at this age group are elderly. The age group used in the survey was 60 (sixty) years old or more, with reference to Law No. 10,741, of October 1, 2003, which in Article 1 establishes the Elderly Statute, aimed at regulating the rights of people aged equal to or greater than 60 (sixty) years.

Active elderly women

The active elderly women who took part in the research participated in a water aerobics group with a frequency of two weekly classes, with 60 minutes and should perform any other exercise of at least 30 minutes. In order to comply with the recommendations of the World Health Organization, which provides for 150 minutes of moderate aerobic activity.

Sedentary elderly women

We considered sedentary elderly women who did not comply with the minimum amount of weekly exercise recommended by WHO, which is 150 minutes / week of moderate aerobic exercise or 75 minutes / week of vigorous exercise. These were in an asylum, in which the observed activities were linked to ADLs or recreational activities such as sewing and reading.

Study location

The research was carried out in the municipality of Feira de Santana, Bahia. The questionnaire was applied to a group of elderly women participating in a community water aerobics project (Active Group) and elderly women in an asylum (Sedentary Group) in the city.

Data collect

A Nordic Musculoskeletal Questionnaire (QNSO) questionnaire was applied, a questionnaire that indicates where the individual felt pain or some type of discomfort (tingling, numbness).

Data analysis

Statistical analysis.

Data analysis was performed using descriptive statistics (mean ± SD), the level of significance was p <0.05 and the statistical package was Stata 10.0.

Ethical aspects
This project complied with Resolution 466/12 of the National Health Council. These data were collected after each volunteer signed a free and informed consent form and approval by the Ethics and Research Committee of the Brazilian College of Systemic Studies (CBES), protocol number 640. CAAE: 0249.0.402.000-09.

3 RESULTS

After data collection in the field, 19 eligible individuals were interviewed according to the inclusion criteria of the research. In the physically active group (n = 9) and in the sedentary group (n = 10).

Source: Own elaboration.

In table number 1, we can observe, among sedentary elderly women, that there is a significant number of elderly women who answered yes to pain, numbness or tingling in the last 12 months, with almost all of them showing some kind of discomfort in the knee, in contrast to elbows and neck were the ones that showed less signs of pain prevalence. The only anatomical region that when asked, there was no sign of musculoskeletal symptoms, was the ankle.

Among active elderly women, data for the last 12 months indicate that none of the anatomical regions exceeded 50%, but all of them were flagged with an indication of musculoskeletal symptoms. The greatest sign of pain, numbness or tingling was in the wrist / hand region and in the upper back with 44%.

Bringing the results of both groups for the last 7 days we can observe a drop in the indicative of musculoskeletal symptoms in both populations, however among the active ones we noticed a reduction of the indicated areas, having no indication of symptoms for neck, shoulders, wrists / hands and ankle. Among the sedentary ones, the mentioned areas remain, when compared to symptoms in the last 12 months, presenting only a reduction in the indicative if musculoskeletal symptoms.
When asked if in the past 12 months they consulted a health professional because of the musculoskeletal symptom indicated in the questionnaire, the index remains above 50%, when correlating the reported symptom and going to the doctor/physiotherapist, in the sedentary group. When we make the same correlation in the active group, we realize that the index is not significant.

4 DISCUSSION
Musculoskeletal and connective tissue diseases affect more than 520 thousand people over the age of 60, generating an expenditure of approximately R $ 733,000 (seven hundred and thirty-three thousand BRL), remaining on average of 8 days hospitalized, according to Datasus (2012). With the growing elderly population, costs tend to increase and facilities that are already insufficient to cover the entire population will become even scarcer. We can thus observe that the current model is inefficient and very expensive, as stated by Da Silveira et al (2013).

Despite not being a direct object of the research, costs with musculoskeletal diseases, in table 2 the sedentary group expresses results that are in line with what is presented in the literature, more than half of the elderly in this group, who indicated musculoskeletal symptoms, sought the service with complaints regarding these symptoms. According to Matsudo (2009), physically active elderly people have improved or maintained muscle mass, muscle strength and bone density, reduced risk of falls and injuries caused by falls and in therapeutic effects, exercise is effective in the treatment of osteoarthritis and in pain management, thus justifying the lower demand for doctors / physiotherapists by the active group.

Even being unable to diagnose the cause of the musculoskeletal symptoms indicated in the applied questionnaire, we found a study that approximates the result obtained in relation to the most affected area, Felipe and Zimmermann (2011) in their study demonstrate that the incidence of osteoarthritis in the knee was 50 %, in our study the incidence among sedentary women was 90% and 22% in the active group. Which also shows conformity with Da Silva (2008), where he mentions that the most affected parts in women are the hands, knees and feet, which can be associated with the type of physical and labor activity practiced.

The study by Campos et al (2012) is in line with the results obtained, even though the research had a younger population of both sexes, the most affected anatomical part was the hip and lower limbs in the sedentary group, which is possible to notice when we saw that the knees were the anatomical part that most indicated symptoms. Another finding made in the research by Campos et al (2012) is that the active group indicated a lower prevalence of musculoskeletal symptoms, in our study it was also observed that in all questions answered by both groups the indication of musculoskeletal symptoms, consultation with physiotherapists / doctors as a result of these symptoms and the suspension of daily activities was lower in active elderly women.

Bobbo et al (2018) in a study with elderly practitioners of Lian Gong and using the QNSO, it was found a very close number of pain reports between sedentary and active, however the active elderly showed a lesser commitment to perform ADLs as well as the reduction in daily use of medicines and a better perception of their own health. Andrade et al (2018) evaluated elderly people who practiced walking and an outdoor gym and found results that go in line with those we found, realizing that all participants obtained a high SF36 score as well as a positive perception of their health status.

When we report on ADLs and quality of life, we perceive a direct relationship with pain, as found by Dellaroza and Pimenta (2012) when 50% of the elderly who reported that pain interfered in their daily
life in a moderate or intense way which makes us correlate with results presented above, where only elderly women in GA presented impossibility to perform ADLs.

The importance of regular physical exercise is not limited to musculoskeletal symptoms, but to the health status of the elderly person in full Cosme et al (2008) states that elderly people submitted to physical exercise programs, in addition to improving physical capacities, mitigates physical losses aging process and improving the age x time of ADL execution, which was shown in Table 3, where we notice that the sedentary group appears with indications of interruption of ADLs due to musculoskeletal symptoms. Borges & Moreira (2009) affirm that there is a decline in functional capacity in active elderly people, but in a slower and less intense way, since in their studies there were no cases of dependence in ADLs.

The benefits brought by regular physical exercise are notorious, Matsudo (2009) lists five categories: anthropometric effects, metabolic effects, cognitive and psychosocial effects, effect on falls and therapeutic effect, all of which bring beneficial qualities to the health of the elderly individual. Esain (2018) observed the negative impacts of physical inactivity after 3 months in elderly people aged 65-90 years, demonstrating negative physical and psychological numbers, reaffirming the importance of physical exercise in physical functions and its impact on ADLs.

Taking into account the data from the National household sample survey continues (PNAD continues) (2017), we noticed an increase in the elderly population exceeding 30 million, when observing the data from VIGITEL (2018) we can see that most of these elderly people, around 60% of those over 65 years old, are in the overweight range, which can lead to overload and joint pain, reduced performance of ADLs and demand for health services, directly impacting quality of life. Lopes MA et al (2016) demonstrates the various causes that directly impact the adherence or not of physical activities, among them is over-protection of the family, carrying out daily activities and physical limitations due to illnesses.

Da Silveira (2013) indicates that health promotion, health education actions, disease prevention and retardation of diseases and weaknesses and the maintenance of independence and autonomy will enable a higher quality of life for the elderly. Due to the low number of active elderly women found to participate in the research and the difficulty in finding regular physical exercise groups for the elderly in the city where the research was carried out, there is a much more culture of treatment than prevention and promotion of health, which directly inferred from the results obtained, where we observed that when there is the presence of a preventive factor, the numbers of treatment or impediment to daily activities are reduced.

De Souza (2011), in his study, warns of diseases of the musculoskeletal system and connective tissue that appears as the second cause that most bothers the elderly, among those cited by the elderly are arthrosis, arthritis, rheumatism and spine disease, it is still a warning was raised about the growing of these diseases, becoming a public health problem. As the results show that the sedentary group has a higher prevalence of musculoskeletal symptoms, when compared to the group that is associated with physical exercise.
The National Health Promotion Policy (PNPS) of 2018, visualizing the importance of physical exercise and body practices, in article 10 defines priority themes for health promotion actions and in item III is:

III- bodily practices and physical activities, which includes promoting actions, counseling and dissemination of bodily practices and physical activities, encouraging the improvement of the conditions of public spaces, considering the local culture and incorporating games, games, popular dances, among other practices

Thus, compacting with what was observed in the result of the study, which points out that physical exercise is a variable to be considered in improving the quality of life and health levels, which ends up having an impact when we compare the difference in musculoskeletal symptoms indicated in the active group and sedentary.

5 CONCLUSION

We conclude that the present study is in agreement with the existing literature, demonstrating that the practice of regular physical exercise is an important variable to be considered in the context of the prevalence of musculoskeletal symptoms in elderly women in a more general way should be taken into account as an accessible factor and low cost for health promotion and prevention, especially in groups at risk, and thus can also be used as a policy to reduce public spending on health.
Principles and Concepts for development in nowadays society: Comparison between osteomuscular symptoms in active and sedentary elderly

ABSTRACT
The objective will be to analyze from the literature how the Peer Instruction (PI) technique can increase the performance and understanding of students in morphology classes. Qualitative, exploratory, and interventionist research. The research will be in the morphology classroom, at the Faculty of Medicine - Integrated University Center, Campo Mourão - PR. Students will be in the sixth period of medicine. The estimated sample will be 80 students. Initially, an expository class will be administered with the help of PowerPoint, and after applying questions based on clinical cases regarding the subject already taught, by the Socrative Student platform. Students will answer the multiple choice questions individually, after discussing among themselves why they chose this alternative without knowing the correct answer. The same will be reapplied to evaluate the income gain. Data collection will be carried out through a questionnaire. The questions will be open for participants to express themselves freely. For the analysis, the Iramuteq software will be used. The IP has been adopted as an alternative for collaborative learning, being considered a teaching method that aims at greater interaction between students during classroom discussions, providing a space for arguments and relationships between students. In this perspective, the diversity of results found shows that the IP is a highly recommended proposal, especially when seeking to engage the student in the learning process. It is believed that the PI can be a timely intervention to develop skills and abilities during morphology classes.

Keywords: Peer Instructions, Active Methodology, Teaching-Learning

1 INTRODUCTION
The active methodology has received considerable attention in recent years. It has attracted strong advocates, among them, teachers looking for alternatives to traditional teaching methods. This expression "active learning" is recognized as an approach to the classroom, where the teaching method is planned to teach students during the learning process, making it the main element in the search for knowledge, in contrast to traditional teaching, characterized by eminently exhibition classes. (Prince, 2004)

Currently, there is a growing active search, by educational institutions, for innovative methods in undergraduate courses, enabling students to develop a critical, reflective, and ethical pedagogical practice. Thus, there are several discussions about active methodologies that can encompass different practices, to increase the student's attention and curiosity to grant an essential learning (Garcia et al., 2019)

In observation of the teaching of higher education, Emmel and Krul (2017), in addition to seeking integration between teaching and teacher education, point out that university teaching and its domains are revealed in pedagogical relations and the problematization of practices. In order to increase engagement in knowledge, due to the exchange of experiences through the search for knowledge, sharing ideas among
peers, bringing the formation of a critical and reflective thought, considering divergent opinions. The active exchange of ideas in small groups in addition to increasing interest, also promotes critical thinking.

One of the alternatives used to try to change medical education has been the inclusion of Peer Instruction (PI) or Peer Instruction (Garcia et al., 2019). Peer Instruction has been adopted as an alternative for collaborative learning, which can be defined as instruction or peer learning, being considered a teaching method that aims at greater interaction between students during classroom discussions, providing the ability to actively engage students during the learning process, in addition to developing social and cognitive skills. (Crouch et al., 2001).

It is known that it is necessary to innovate in the teaching process – learning, so that it becomes more interactive, attractive and practical during learning, facilitating the acquisition of knowledge, involving the student in order to develop skills and reasoning. On the other hand, the student's perception has rarely been evaluated for the choice of the methodology to be applied.

In the course of medicine, the discipline of morphology is inserted from the first year, and until the fourth period this discipline has a more conceptual view and from this begins to have a focus with more problematizations, with the purpose of stimulating students to the intimate relationship between concepts and clinical practice so that there is understanding and connection of pathophysiology, diagnosis and therapy.

In view, considering that the formulation of hypotheses and problem solving is one of the competencies necessary for the graduate of the medical course, it is of paramount importance to evaluate the perception of the student in relation to the methodology applied in the teaching process - learning.

In the midst of the diversity of existing active methodologies, it is feasible to choose the most appropriate to the course stage. The use of problematization processes, case analyses and project-based learning provide better implications for training in more advanced stages of the course, while in the initial semesters demonstrations, classroom discussions, presentations, conceptual and mental schemes are more pertinent (Oliveira et al., n.d.)

Peer Instruction is an active teaching-learning methodology that helps teachers quantify, in real time, students' understanding and understanding of the topics presented in the classroom. Thus, both the student and the teacher will be able to obtain immediate feedback about the learning on a particular topic taught in class (Crouch et al., 2001).

This methodology, also known as Peer Instruction (IpP), which provides greater interactivity in the classroom, was developed by Professor of Physics Eric Mazur, Harvard University (Müller et al., 2017). Since its creation in the 1990s, IpC has been presenting relevance in the international teaching method due to its ability to facilitate development, cognitive skills and means of interaction, with a positive impact on the teaching-learning process (Müller et al., 2017; Crouch et al., 2001).

Brito & Campos, 2019 conducted a study in the area of Physical Education, in which a gain in income was observed after the application of the collaborative methodology – Peer Instruction. In the
authors’ perception, this satisfactory performance confirms the understanding of the concepts necessary for learning for the knowledge of a future professional, and it was also noted that this income is associated with collaborative participation in pairs.

As evidenced in the research dissertation of Meirelles, 2020, in the medical course, in the classes of Clinical and Therapeutic Skills at the Faculty of São Caetano do Sul, after the application of the collaborative methodology – Peer Instruction, there was a satisfactory performance and an improvement in the understanding of the concept after collaborative participation among peers.

This circumstance highlights the importance of health education actions as an integrative strategy of a collective knowledge that translates in the individual its autonomy and emancipation. (Machado et al., 2007).

Valente (2014), setting out examples of the introduction of Project-Based Learning (ABPP) and Problem-Based Learning (BPA) indicates difficulties in applying these methods, with numerous classes. These problems can be repaired with the introduction of Information and Communication Technologies (ITCs) in classrooms, configuring Hybrid Teaching (Blended Learning), that is, merging the online resource with face-to-face activities for the implementation of the active methodology (Brito & Campos, 2019).

In this perspective, it is believed that the collaborative strategy, called Peer Struction, may be a necessary intervention to develop skills and abilities during morphology classes. In this way, we will conduct this study, with the objective of analyzing how the IP technique can increase the performance and understanding of students during morphology classes.

2 METHODOLOGICAL PROCEDURE

Field research allows the understanding of how students in the sixth period of the morphology class will have a greater understanding of knowledge. application of the adapted Peer Instruction technique. On this type of research, Gonsalves (2001 apud Piana, 2009, p. 169) pronounces:

Field research is the type of research that aims to search for information directly with the population surveyed. It requires a more direct encounter from the researcher. In this case, the researcher needs to go to the space where the phenomenon occurs, or occurred and gather a set of information to be documented [...] 

The information will be collected using Google Forms, and the research subjects will be students of the sixth period of the morphology course, of the Medical Course of the Integrated University Center of the city of Campo Mourão - Paraná. With this in mind, the approach used will be qualitative:

Qualitative research answers very particular questions. She worries [...] about a level of reality that cannot be quantified. That is, it works with the universe of meanings, motives, aspirations, beliefs, values and attitudes, which corresponds to a deeper space of relationships, processes and phenomena that cannot be reduced to the operationalization of variables (Minayo, 1994 apud Chiapetti, 2010, p. 144).
This approach will be carried out from an exploratory perspective, with a view to closer approximation with the reality of the subject under study. According to Gil (2008, p. 27), "exploratory research is developed with the objective of providing an overview, of an approximate type, about a given fact".

When the researcher goes to the field, he has a personal perspective of the problem, as well as references from a theoretical survey conducted before his going. This brings it closer to the problem studied, giving it a foundation and sometimes completing existing gaps. However, when talking to the research subjects, the researcher's perspective is usually altered, forming a new vision or complementing the existing one.

In this sense, exploratory research often leads the researcher to the discovery of new approaches, perceptions and terminologies for him, contributing to his gradually his own way of thinking being modified. This means that it progressively adjusts its perceptions to the perception of the interviewees. In other words, he is able to control, almost imperceptibly, his personal bias (Piovesan et al., n.d 1995, p. 321).

The instrument used for data collection will be a questionnaire. According to Gil (2008, p.121), "one can define a questionnaire with the research technique composed of a set of questions that are submitted to people with the purpose of obtaining information about knowledge, beliefs, feelings, values [...]".

2.1 FIELD

This study will preferably be carried out in person, being transferred online through the Google Meet platform if a new government decree that does not authorize face-to-face meetings occurs. The research field will be in the morphology classroom once a week at the Faculty of Medicine - Integrated University Center, located in the city of Campo Mourão, Paraná.

2.2 SUBJECTS

The population will be students of the sixth period of the medical course enrolled regularly at the Integrated University Center, in the city of Campo Mourão, Paraná. The estimated sample number will be 80 students, however it will depend on the number of adherence to students who will fill out the Free and Informed Consent Form (TCLE), which will be delivered at the first meeting and will be filled out in person. Initially, an exhibition class with the aid of the power point will be administered, and subsequently applied questions based on clinical cases related to the subject already taught, by the Socrative Student platform. Students will answer multiple choice questions at first individually, and will be given time to discuss among them why they chose such an alternative without knowing the correct answer. They will be reapplied to assess the income gain.
2.3 PREPARATION OF THE INSTRUMENT

Data collection will be performed through a questionnaire elaborated by the researcher. The construction of this instrument followed some procedures, with a view to giving it greater reliability.

For the elaboration of the questions, the researcher based on the bibliographic reference. From it, the following themes were established, chosen to meet the research objectives: Thyroid Hormones, Hyperthyroidism and its Pathophysiology, Peer Instructions (Chart 1). Questions will be opened so that participants can express themselves freely, allowing a better exploration of the answers.

Table 1: Script of questions (Questions) organized from its themes and its objectives.

Source: Prepared by the author.

The exploratory study allows, therefore, to combine the advantages of obtaining the qualitative aspects of information with the possibility of quantifying it later. This association is carried out at
the level of complementarity, making it possible to broaden the understanding of the phenomenon under study (Piovesan et al., n.d; 1995, p. 322).

The questionnaires will be extracted from Google Forms and saved in Word, ensuring the registration of the information, to analyze the collected data.

2.4 ANALYSIS PROCEDURE

Once the Google Forms questionnaires have been extracted and converted into Word files, you will perform an analysis in which the data obtained and the theoretical framework collected were related. It is based on the methodology of content analysis, in which categories are created for data interpretation:

Content analysis is a technique of analysis of communications, which will analyze what was said in the interviews or observed by the researcher. In the analysis of the material, we seek to classify them into themes or categories that help in understanding what is behind the discourses. (Silva & Fossá, 2015, p. 2).

Thus, after the questionnaires will be saved, it will perform the exploration of the collected material. The text of the answers will be encoded, considering clippings of the text as units of record. According to Franco (2008), the units of record can be considered through words, themes, characters and/or items. After the design of the registration units, the "establishment of categories that differ thematically in the units of record (passage of raw data to organized data)" (Silva & Fossá, 2015, p. 4).

Thus, the text of the interviews is cut into units of record (words, sentences, paragraphs), grouped thematically into initial, intermediate and final categories, which allow inferences. Through this inductive or inferential process, we seek not only to understand the meaning of the interviewees' speech, but also to seek another meaning or another message through or with the first message. (Silva & Fossá 2015, p. 4).

The categories will be created after the interviews, because, in this way, they emerged based on the contents of the answers, discourses and analysis of the collected material (Franco, 2008).

The formulation of these categories follows the principles of mutual exclusion (between categories), homogeneity (within categories), pertinence in the transmitted message (non-distortion), fertility (for inferences) and objectivity (understanding and clarity). (Silva & Fossá 2015, p. 4).

In order to assist in the creation of registration units and, consequently, of categories, it will use the Iramuteq software, in which the obtained data were processed.

This computer program enables different types of textual data analysis, from very simple ones, such as basic lexicography (word frequency calculation), to multivariate analyses (descending hierarchical classification, similitude analyses). It organizes vocabulary distribution in an easily understandable and visually clear way (similarity analysis and word cloud). (Camargo & Justo, 2013a, p. 515).

The software offers five possibilities of analysis. In this research we intend to use the Descending Hierarchical Classification Method (CHD), which
3 RESULTS AND DISCUSSION

Active methodologies have received considerable attention in recent years. They have attracted strong advocates, among them teachers looking for alternatives to traditional teaching methods. This expression "active learning" is recognized as an approach to the classroom, where the teaching method is planned to teach students during the learning process, making it the main element in the search for knowledge, in contrast to traditional teaching, characterized by eminently exhibition classes. (Prince, 2004)

The learning process is complex and involves internal factors of physiological and psychological interactions and interaction with the external environment. It covers the habits that the subject forms with the assimilation of social and cultural values, to which he has access during the socialization process. It is, therefore, to face external demands of a social nature, mobilizing the subjects to develop answers that satisfactorily meet such demands. (Piovesan, et al 2018)

By relating to people and objects, the human being forms bonds and develops different ways of knowing and learning, based on both individual and collective experience. Such experiences are capable of constructing learning models that are elaborated and modified based on interactions with objects of knowledge, with others and with themselves. (Piovesan, et al 2018)

All of us, in our daily relations of development and action, work considering the three main theories about the learning process: (I) inattista, (II) environmentalist and (III) interactionist. (Peres et al, 2014)

For the inatist theory of knowledge, the focus of learning is the subject himself. The concept is based on the idea that genetic and maturational factors define what constitutes a human being, that is, learning happens from the inside out. Thus, the role of the school and the teacher is to favor the expression of innate characteristics, however educational success depends on the characteristics brought by people (Peres et al, 2014).

In the opposite way to environmental theory, it attributes to the environment the constitution of human characteristics. It values the role of the teacher and considers that learning occurs through the transmission of information. Teachers are at the heart of this process, and should be great connoisseurs of the issues to be addressed and responsible for the transmission of information to students. (Peres et al, 2014).

For interactionist or constructivist theory, the focus is on the processes of knowledge, that is, on the interaction between the subject who learns and the object, both hereditary factors and contents, culture and society interact in learning. People are the subjects who actively seek information. Teachers guide the learning process, acting as a facilitator and mediator of knowledge between subject and object. (José Alencar Gomes da Silva Minister of State for Education Fernando Haddad Secretary of Special Education Claudia Pereira Dutra Rector of the Paulista State University - et al., n.d)
Thus, the teacher acts as a facilitator of knowledge, a mediator between subject and object, guiding the teaching-learning process. The internal motivations, previous knowledge, the active and collaborative posture of the students along with the direction of teachers in the search for new knowledge collaborate with the process of learning construction.

In line with the National Curriculum Guidelines, 2014, which states that the medical course should have its pedagogical project built collectively, centered on the student as a subject of learning and the teacher only a facilitator and mediator of the teaching-learning process. And describes in article 29, as structuring the course, the following: Use methodologies that privilege the active participation of the student in the construction of knowledge and integration between the contents, ensuring the indissociability of teaching, research and extension (Brasil, 2014, pag 4). And again to emphasize in Article 32: The Undergraduate Course in Medicine should use active methodologies and criteria for monitoring and evaluation of the teaching-learning process. (ibid)

A qualitative study conducted by Ribeiro et al (2016) evaluated how the active methodology has reflected in the teaching-learning process, analyzing the potentialities and limitations of this new teaching method within the context of academic activities developed during medical graduation. Exploring the students’ perspective, it was observed that most of the participating students see the active methodology as an excellent teaching strategy, being superior when compared to the traditional teaching methodology.

Thus, the student must be the protagonist of his learning, in this sense he must be removed from his passivity and encourage him to seek information for the construction of his own knowledge. This fact would not occur so easily if the student was passive in this process, only as a receiver of information passed on by the professors. (Oliveira et al., n.d.)

The students, when searching in the bibliography for the subjects for the construction of their knowledge throughout the undergraduate course, promote them as a researcher, facilitating the construction of skills such as creating, investigating, criticizing and reflecting (Andrade & Vieira, 2012).

Carvalho and Santos, 2022, conducted a qualitative study on the Perception of Academics with traditional and active methodologies in the Teaching of Chemistry for Agrarian Sciences at the State University of Mato Grosso - Campus Sinop. Scientific evidence shows a gain in the construction of learning with the use of active methodologies, and even a preference of 66.7% of students for the active method, in which they presented a greater success in learning with the application of the Active Methodology.

As evidenced by Garcia et al (2019), in a qualitative work, with 50 students from the second and final year of the nursing course, about the perception of students in the construction of knowledge in the context of active methodology, which positively assists in the development and construction of knowledge.

Active methodologies have the potential to arouse curiosity, as students engage with the search for knowledge and bring new elements, not yet considered in classes or in the teacher's own perspective, bringing engagement, perception of competence and belonging, in addition to persistence in studies. (BERBEL, 2011).
In the midst of the diversity of existing active methodologies, it is necessary to choose the most appropriate to the course stage. Demonstrations, classroom discussions, presentations, conceptual and mental schemes are relevant in the initial semesters, while in the other semesters the use of problematization processes, case analysis and project-based learning provide better implications for training (Oliveira et al., n.d.).

There are several discussions about active methodologies that can encompass different practices, with the aim of increasing the student's attention and curiosity to grant essential learning. One of the alternatives used to try to change medical education has been the inclusion of Peer Instruction (PI) or Peer Instruction (Garcia et al., 2019).

**Peer Instruction** is an active teaching-learning methodology that helps teachers quantify, in real time, students' understanding and understanding of the topics presented in the classroom. Thus, both the student and the teacher will be *able to obtain immediate feedback* about learning about a particular topic taught in class (Crouch et al. 2001).

This methodology, also known as Peer Instruction (IP), which provides greater interactivity in the classroom, was developed by Professor of Physics Eric Mazur, harvard university (Müller et al., 2017). Since its creation in the 1990s, IP has been presenting relevance in the international teaching method due to its ability to facilitate development, cognitive skills and means of interaction, with a positive impact on the teaching-learning process (Müller et al., 2017; Crouch et al., 2001).

Peer Instruction has been adopted as an alternative of collaborative learning, which can be defined as instruction or learning by peers, being considered a teaching method that aims at greater interaction between students during classroom discussions, providing a space for arguments and relationships between students (Crouch et al., 2001).

IP has been used in various research themes, in the areas of medical sciences, humanities and exact. Rao and Di Carlo apud Muller (2017) evaluated the impact of interaction between colleagues on student performance in conceptual issues in a Physiology course for medical students. The questions answered by the students were categorized as: comprehension, application and analytical skills; in the three categories there was a statistically significant increase in the score of students after discussion with colleagues: 94% to 99%, 82% to 99% and 73% to 99% respectively. (Müller et al., 2017).

We can verify in Garcia et al. (2019) that, when conducting a research with 30 volunteer students of the Medical course, evaluating their perception in biochemistry classes and observed results that showed correct 67% (before the group discussion) at the initial moment of the activities and, after applying the technique, observed about 100% (after the group discussion) in the performance.

Müller et al. (2017) in a systematic review of the literature, according to the implementation of the active peer instruction (PI) teaching methodology from 1991 to 2015 evaluated the impacts that IP has produced on student learning. The diversity of results found shows that IP is a highly recommended...
proposal, especially when seeking to engage the student in the learning process, as well as improve their learning outcomes.

In view, considering that the formulation of hypotheses and problem solving is one of the competencies necessary for the graduate of the medical course, it is of paramount importance to evaluate the perception of the student in relation to the methodology applied in the teaching process - learning.

Pereira and Afonso (2020) conducted a quantitative research, in which 24 students of the Physiotherapy course in the discipline of morphological and physiological sciences about their general perceptions about peer instruction, and obtained positive results, it was found that, in their perceptions the methodology helped them to study individually the contents and practice skills such as teamwork and argumentation, reinforcing the importance of active methodologies in the teaching-learning process and in the training of students with a critical and reflective profile.

Data obtained from the researches carried out by Mazur (2012) indicate that, with the use of the Peer Instruction methodology, the level of information retention by students during classes has a variation in the percentage initially calculated from 20% - only using traditional exhibition classes - to a percentage of 60% from the application of this methodology.

Godoi and Ferreira (2016) in a quantitative and qualitative study conducted by the Salesian University Center of São Paulo - UNISAL, on the application of Peer Instruction in Higher Education, evidence positive points and difficulties encountered in the application of the method.

On the positive aspects, an evolution of students' performance is shown after the impact of the application of the Peer Instruction methodology. In relation to the difficulties encountered, they point to the following aspects: (I) a greater volume of work in the preparation, application and evaluation of activities by teachers; (II) challenges involving the question of how to deal with the low interest of some students, as well as the lack of conceptual "basis"; and (III) issues related to logistical and technological difficulties involving the tools that support the methodology.

Although the active teaching methods are related to a greater effectiveness of the learning process in health courses, students face difficulty adapting to the method due to a culture of exhibition classes implemented in the country since basic education. Where a teacher exposes the content and the student only passively receives and reproduces the information (FERREIRA; MOROSINI, 2019)

Authors such as Berbel (1998), Bordenave and Pereira (1985) argue that the teaching-learning process should not be restricted exclusively to a single methodology. It should be sought to extract the best that each method is able to offer and enjoy the potential of both, prioritizing the effective construction of knowledge.
4 FINAL CONSIDERATIONS

It is known that it is necessary to innovate in the teaching process – learning, so that it becomes interactive, attractive and practical during learning, facilitating the acquisition of knowledge, involving the student in order to develop skills and reasoning. Thus, the diversity of results found shows that IP is a highly recommended proposal, especially when seeking to engage the student in the learning process, since the engagement provided by the IP makes students more responsible for their learning throughout the disciplines, facilitating understanding and interaction, as well as the exchange of ideas among students, improving your learning outcomes.

ABSTRACT

The soil-cement bricks, better known as ecological bricks represent an alternative fully in line with the guidelines of sustainable development because they require low power consumption in the extraction of raw materials, exempt the firing process and reduce the need for transport once the bricks are produced with the floor of the work site itself. The aim was to evaluate the use of construction waste in the production of ecological bricks. The bricks were manufactured basically by a mixture that consisted of soil, cement, and different percentages of construction waste. The results were compared with current standards. Although the dosages of the bricks produced do not achieve the compression strength values required by NBR 10834 (1994), the addition of construction waste significantly improved characteristics of the same, both the water absorption, since only the witness received no the rate expected by NBR 10834 (1994), and the mass loss, all met the standard that is below 5%.

Keywords: Soil cement. Environmental sustainability. Resistance to compression

1 INTRODUCTION

That civil construction is the branch that provides the most employability, this is undeniable, but what the majority of the population does not know is that in construction, the amount of waste left is about five times greater than the amount of products, making with this branch becoming the center of discussions. For companies that bet on a more sustainable construction, research shows that the immediate cost is 5% higher than the normal cost, but the savings generated in the long term can reach up to 30%, in addition to helping nature (NETO, 2014).

Soil has been the most used material in civil construction since the earliest times, as it has good thermal and acoustic insulation, is low cost and is very abundant. Studies indicate that the first record of stabilized earth, earth mixed with ash and molded into adobe are from 4,500 BC and were found in the region of Tépé Gawa (PEREIRA et al., 2010).

This context makes new materials, or even high performance materials, and more efficient construction systems the main objectives in the attempt to establish a healthy relationship between low cost and quality of our works without neglecting the culture, the reality of consumption and the limits of manpower.
Soil-cement bricks, currently better known as ecological bricks, according to Grande (2003) represent an alternative in full harmony with the guidelines of sustainable development, as they require low energy consumption in the extraction of raw material, do not require the burning process, thus reducing the emission of carbon dioxide to the environment, in addition to reducing the need for transport, since the bricks can be produced with the soil at the construction site itself.

The soil-cement brick according to NBR 8491/1994 is one that has 85% of its volume consisting of a homogeneous mixture of soil, Portland cement, lime, water and any additive in proportions that meet it. According to the Brazilian Association of Portland Cement, soil-cement was initially used for paving roads (PEREIRA et. al., 2010 apud ABPC, 1986).

To manufacture “normal” bricks, that is, ceramic blocks that use firing for curing, a large part of “fat” clay is used in the manufacture with a small part of “lean” clay to homogenize the mass. The “fat” clay has a high plasticity index, on the other hand, the lean clay has a low plasticity index due to the large amount of quartz, in addition to a greater granulometry than that of the fat clay (MOTTA et al., 2001). In some shipments, when the lean clay does not meet expectations to homogenize the mass, it is necessary to use a kind of additive to make the correction in the mass. This additive is called chamotte, which is nothing more than the ceramic residue burned and rejected from the process; for this case, a range of 5 to 10% is used (Manfredini & Schianchi, 2009).

For the soil-cement brick to be characterized as a quality product, it must meet the requirements of NBR 8491/1984 with regard to dimensions and respective tolerances, compressive strength and water absorption, so it can be made available to the consumer market.

One of the most important characteristics that ecological bricks have to demonstrate is their compressive strength. According to (SOUZA, et. al., 2011 apud FUNTAC, 1999) the greater the increase in the Portland cement content in the soil-cement brick paste, the greater its resistance, being possible to obtain a resistance of up to 2.8 MPa, by adding 10% of it.

Research and development projects dedicated to the manufacture and study of these bricks have gained space and their diffusion in the civil construction market is starting to grow. Ecological bricks are currently sold at prices quite similar to burnt clay bricks, in addition to having the environmental preservation factor associated with their purchase.

According to (OLIVEIRA et al., 2014 apud TAVEIRA, 1987), in addition to the many advantages, ecological bricks benefit from: i) they do not provide conditions for proliferation and housing for insects harmful to health, due to their smooth finish ii) they provide a construction clean, where waste can become future ecological bricks. iii) increases structural strength, and functions as a thermal and acoustic system. iv) if the bricks are manufactured with holes, they do not need conduits for electrical and hydraulic installations. v) reduction of up to 80% in the use of cement, among others.

The objective of this article is to show that with the exorbitant amount of waste from civil construction, something useful can be done with such waste, in addition to providing cleaner buildings,
which are buildings with a seal of sustainability, in addition to evaluating the use of these waste from the civil construction in the production of ecological bricks. Contributing an alternative for recycling these wastes and reducing the environmental impact of buildings promoting sustainable development.

2 MATERIALS AND METHODS

In order for the mechanical properties to be fully evaluated, we selected a company from the central region of the state of Goiás, where it collects stationary buckets with construction waste and transports it to its patio, in the Agroindustrial zone of Aparecida de Goiânia - GO.

As soon as the raw waste arrives in the yard, it undergoes a “gross separation”; which is nothing more than the removal of the Class B, C and D material and after that it is placed in the crusher, as shown in Figure 01. The materials resulting from this process are classified as: i) crushed stone 02; ii) crushed stone 01; iii) crushed stone 0; iv) coarse sand; and v) medium sand.

As it is soil-cement bricks, type v residue was used, which is the classification for medium sand; so all construction waste was provided free of charge by the company RENOVE.

For the manufacture, the company TIJOLEKO, based in Anápolis-GO, provided its space, press and some instruments necessary for making them.

Figure 01 - Material removed in loco

Source - Authors' collection

According to NBR 10832 - Solid soil-cement brick, it was used in the manufacture of the same, basically a mixture consisting of soil removed from the vicinity of the industry in Anápolis-GO, Portland Cement type CP V - ARI, and as an additive, different percentages of construction waste (0%, 10%, 20%, 30%, 40%, 50%), duly calculated. The amount of portland cement was set at 10% for each of the types set.

As described above, the tests strictly followed the current technical standards, and the samples with the following nomenclatures were used:

A - Soil + 50% waste + 10% Portland Cement;
B - Soil + 40% waste + 10% Portland Cement;
C - Soil + 30% waste + 10% Portland Cement;
D - Soil + 20% waste + 10% Portland Cement;  
E - Soil + 10% waste + 10% Portland Cement;  
X - Soil + 00% waste + 10% Portland Cement.

Before mixing, the components were passed through a 200 mm sieve, in order to break up small clods present in some materials; after this process, the cement, soil, civil construction residues are gradually added, and a rigorous manual homogenization is carried out until acquiring a uniform color; at the end of the homogenization stage of the dry materials, the drinking water was gradually introduced and a new homogenization was carried out, until the mixture acquired a crumbly appearance.

The mixture needs to have the appearance of farofa, since for the manual press it is not possible to press the dry material, nor too wet. In the first case, the ceramic block would not be pressed and would fall apart as soon as the form was removed; and in the other case, it would turn to clay and not be pressed.

The mixture, as described above, is contained in NBR 10833 (2012) and was taken to the manual press where the pressing was done in molds. All manufactured elements, as shown in Figure 02, were stored in an area for curing and kept moist for 07 days, so that there was no dehydration.

Figure 02 - Molded and pressed bricks

After curing, the molded bricks were transported to the soil laboratory at Universidade Paulista – UNIP. The duly cured specimens were submitted to the Compression Resistance test, following the standard of NBR 8492 (2012), which prescribes the methods that must be used in the tests for solid bricks; The tests were carried out after 40 and 80 days of curing in the hydraulic press of the Soil Laboratory of Universidade Paulista.

NBR 8492 (2012) describes the methods to be performed for the tests to be validated:
4.3. Simple compression test
4.3.1. From each sample, seven specimens must be prepared as follows:
   a) cut the brick in half, perpendicular to its greatest dimension;
   b) superimpose the two halves obtained and the cut surfaces inverted on their larger faces, bonding
      them with a thin layer of pre-shrunk Portland cement paste (rest for approximately 30 min), 2 mm
      to 3 mm thick and wait for the paste to harden. The strength of the cement paste cannot be less than
      that of the brick under test;

   4.3.3. After hardening of the material used, the specimens must be identified and immersed in water
         for at least 6 hours.
   4.3.4. The specimens must be removed from the water immediately before the test and superficially
         dried with a slightly damp cloth. This operation must be carried out in a maximum of 3 min.
   4.3.6. The specimen must be placed directly on the lower plate of the compression testing machine,
         so that it is centered in relation to it.
   4.3.7. Load application must be uniform and at a rate of 500 N/s.
   4.3.8. The load must be gradually increased until the rupture of the specimen occurs. ABNT NBR
         8492 (2012, p. 6-7).

Therefore, following the NBR above, all the specimens that should be tested by the compression
method were cut, and after that, Portland cement paste was inserted between the two halves of the blocks,
as shown in Figure 03.

After curing the Portland cement paste, the glued bricks were immersed in water for 24 hours as
can be seen in Figure 04.
Continuing the compressive strength test, the specimens were removed from the water (Figure 05), dried and taken to the hydraulic press until they were broken, as shown in Figure 06.
The water absorption test was also carried out in accordance with NBR-8492 (2012), where the bricks were dried in an oven at a temperature of 110 °C for 24 hours as shown in Figure 07 and weighed.
after the temperature of the specimen was identical, at room temperature, thus acquiring the mass value M1.

After the bricks were at room temperature, they were immersed for 24 hours in water as shown in Figure 08, from where they were removed for further weighing after being superficially dried, thus acquiring the value of mass M2.

To calculate the respective absorption values, we have the following equation:

\[ A = \frac{M2 - M1}{M1} \times 100 \]

Being:
M1 = mass of kiln-dried brick;
M2 = mass of saturated brick;
A = water absorption, in percentage.
NBR 8692 (2012) requires only these two tests, but one more test was performed concerning the loss of mass by immersion. This trial was performed in accordance with the guidelines of ME 26 – IPT/BNH.

The specimens used for the aforementioned test were the same used for the absorption test, evidently taking due care, such as: the specimens are placed in the oven (Figure 07), after the specimens are removed from the study, were immersed in still water without any part coming into contact with the surfaces of the container, (except the lower part where the block is supported) care was taken so that the water was at least 10 cm above the specimen.

In the same way as in the previous test, the bricks remained submerged for 24 hours, after which the percentage of the brick was collected through a 0.075 mm sieve, where the loosened and weighed mass was added to the equation:

\[
P_i = \frac{M_d \times 100}{M_0} \times 100
\]

Being:
Md = mass released from the specimen;
Mo = mass of the specimen after oven;
Pi= mass loss by immersion, in percentage
3 RESULTS AND DISCUSSIONS

The results obtained for each of the tests performed are individually presented below, namely: compression analysis; mass loss analysis; and analysis of water absorption.

To make the comparison, values taken from ABNT NBR 8491:2012 Soil-cement bricks - Requirements are used as a reference, which are given as:

5.2. compressive strength
   The sample tested in accordance with ABNT NBR 8492 cannot have the average compressive strength values lower than 2.0 MPa (20 Kgf/cm²) nor an individual value lower than 1.70 MPa (170 Kgf/cm²), with a minimum age of seven days.

5.3. water absorption
   The sample tested in accordance with ABNT NBR 8492 cannot have the average water absorption values greater than 20% or individual values greater than 22%, with a minimum age of seven days. ABNT NBR 8491 (2012, p. 8).

Therefore, after compiling the data obtained in the tests, it will be possible to verify, in accordance with NBR's 8491 and 8492, if the soil cement bricks with additive of the Civil construction waste type meet these norms, being able to be commercialized and used in more clean and environmentally friendly.

Compression Analysis

Table 01 shows the average strengths referring to the age of the specimens - 40 and 80 days.

<table>
<thead>
<tr>
<th>Dosage</th>
<th>Average Resistance (MPa)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>40 days</td>

<tr>
<td>Soil + 50% residue + 10% cement</td>
<td>1.08</td>
</tr>
</tbody>
</table>

Source – The authors.

Analyzing Table 01, an increase in resistance is observed when incorporating construction waste into the soil. This increase was higher mainly in soil bricks with 40 and 50% residue, the strength coincidentally doubled.

However, according to NBR 8491 (2012), the sample tested must present at least seven days of age, an average of compressive strength values equal to or greater than 2.0 MPa, and individual values equal to or greater than 1.7MPa. Through the data described in that table, it is possible to observe that none of the dosages studied reached the values established by the standard.

It is noticed that the dosages had their resistances increased at 80 days in relation to 40 days. This behavior indicates that the chemical reactions that occur in cement improve the mechanical properties over time.
Mass Loss Analysis

Table 02 shows the mass losses of bricks with different amounts of additives and different age of the specimens - 40 and 80 days. For checking the loss of mass by the same.

<table>
<thead>

The tested bricks showed mass loss within the specified standards since they did not lose even 1% of the mass at any of the tested ages.

Analysis of Water Absorption

Table 03 presents the values of water absorption in the bricks of different amounts of additives and different age of the specimens - 40 and 80 days. To check the percentage it absorbs.

Source – The authors.

NBR 8491 (2012) prescribes that the average of water absorption values must be less than or equal to 20%, and the individual values equal to or less than 22%, at 28 days.

Through Table 03, it can be seen that only the type of block that does not have any percentage of residue (type x), is not in accordance with the Standard, showing that the inclusion of the residue can be beneficial, reducing the porosity of the block and automatically absorb water by the bricks.

4 FINAL CONSIDERATIONS

Soil-cement bricks are an alternative for a cleaner construction, since most of them do not need cuts, as they have internal holes that allow the passage of conduits and conduits, or even water pipes, sanitary sewage and even even rainwater.
In addition, we still have the issue of carbon dioxide emission to the environment, which in the case of soil-cement bricks is zero, since the block is not directed to burning.

Regarding the civil construction waste, it was observed that the amounts of this additive incorporated into the soil were not sufficient to achieve the technical feasibility of soil-cement bricks.

As no Standard regulates the amount of additive that can be placed in the mixture, a maximum of 50% was chosen, which is half of the total mass; comparing with the compression results, it is observed that, increasing the residual additive even more, there is the possibility of increasing the strength, as well as increasing the percentage of portland cement; however, one must not forget that it is a soil-cement brick, and the presence of soil in it is extremely important.

Although none of the dosages of the produced bricks reached the compressive strength values prescribed by NBR 6491 (2012), the addition of civil construction waste significantly improved their characteristics, both in terms of water absorption, since only the witness did not obtain the expected index, as in mass loss, where all obtained the index well below the limit, which is below 5%.

In addition to significantly improving, this type of brick is a means of keeping the construction clean, reducing costs in purchases of inputs, waste in construction, in addition to helping the environment, as it is an ecological brick.

ABSTRACT

The expression harm reduction (harm reduction) has undergone a profound conceptual expansion and its historical construction justifies this fact since it is marked by a shift from the proposal of the control of infectious diseases to a set of policies and practices that, integrated with the actions of prevention, treatment, and social reintegration, aim to reduce individual and social damage related to the use of psychoactive substances (FONSÊCA, 2012; TOTUGUI, 2009). Therefore, the purpose of this topic is to explore the emergence of Harm Reduction and its conceptual advances. It should be noted that the motivation for drawing this story is not to show the chronological course but to present the construction of meaning for the existence of harm reduction and the consolidation of a new paradigm of care within the scope of drugs.

1 INTRODUCTION

The expression harm reduction (harm reduction) has undergone a profound conceptual expansion and its historical construction justifies this fact since it is marked by a shift from the proposal of the control of infectious diseases to a set of policies and practices that, integrated with the actions of prevention, treatment, and social reintegration, aim to reduce individual and social damage related to the use of psychoactive substances (FONSÊCA, 2012; TOTUGUI, 2009). Therefore, the purpose of this topic is to explore the emergence of Harm Reduction and its conceptual advances. It should be noted that the motivation for drawing this story is not to show the chronological course but to present the construction of meaning for the existence of harm reduction and the consolidation of a new paradigm of care within the scope of drugs.

The vast majority of authors date the emergence of harm reduction in 1926, in England, with the publication of the Rolleston Report. This report was prepared by a group of physicians who claimed that the most appropriate way to treat heroin and morphine addicts was to administer and monitor substance use (FONSÊCA, 2012; WODAK, 1998; MESQUITA, 1994). The Report defended the right of physicians to prescribe controlled supplies of opiates to drug users in situations of withdrawal syndrome, when drug...
use, after evidence, could not be discontinued due to harm to the user, and in cases where it was proven that the drug patient would depend on the use of the drug to lead a normal and productive life, becoming ineffective if this use was interrupted (FONSÊCA, 2012; DOMANICO, 2006).

The Rolleston Report was a landmark because it argued that addicts could not be treated by abruptly imposing abstinence on them. It was recommended to monitor users who wished to abstain from the use of the substance in order to alleviate the symptoms of withdrawal or to help in the administration of drugs to those who wanted to continue using them, as described by Domanico (2006). In turn, Fonseca (2012) presents another reason to consider the Rolleston Report a landmark: for the first time in history, drug addiction is seen from another perspective, a complex problem that demands multiple and unique strategies. The initiative proposed by the Rolleston Report was the target of expressive attacks, even being disapproved for partisan political reasons.

The new health perspective gained expression with the exchange of used syringes for new ones carried out in the Netherlands, more precisely in the city of Amsterdam. In fact, the Netherlands has always stood out on the world stage for espousing a liberal policy. In 1972, the Dutch government, concerned about the growth of problems related to drug use, made significant changes in drug policy. The distinction established by law in 1976 between drugs of acceptable use (marijuana, hashish) and drugs of unacceptable use (LSD, cocaine, amphetamine and heroin) sought to involve people in the responsible use of psychoactive substances, signaling for the differentiated treatment of according to the risk potential of each one of them (DOMANICO, 2006).

In this context of protagonism of drug users, in 1980, the Association of Injectable Drug Users - Junkiebond (RIBEIRO, 2013) was created. The Dutch association, in response to concerns about the spread of hepatitis B, promoted in partnership with the government the first used syringe exchange program in 1984. The objective of the needle exchange project was to protect users from harm and provide better living conditions through safe use (DOMANICO, 2006). When it became certain that HIV was transmitted through blood, the need for effective preventive actions became even more evident, and the project that was born to fight hepatitis B was extended as a goal that also covered the fight against AIDS (FONSÊCA, 2012).

The success of the project had repercussions throughout the European continent. In England, for example, harm reduction strategies gained support. In 1985, users were already able to offer several services, including needle exchange, education and counseling, drug substitution prescription, treatment for addiction and detoxification, employment and housing (FONSÊCA, 2012). Several public health managers and non-governmental organizations have come to understand the importance of epidemic prevention and the need for systematic and effective actions. With the development and success of such initiatives, the concept of harm reduction was revised, expanded and incorporated by many countries, such as Switzerland, Canada, Australia, Germany and even Brazil, which undertook similar programs (RIBEIRO, 2013).
Domanico (2006) says that the policy of repression instituted by the United States against coca-producing countries gave rise to alternative routes for the cocaine trade, including Brazil, towards large consumer markets, notably the United States and Europe. As a result, there was an increase in the circulation of drugs in Brazil and the cities that were part of the trafficking route witnessed a significant increase in the number of AIDS cases. In the 1970s, drugs such as cocaine became a public health problem due to increasing abuse and dependence.

Santos, a city in the State of São Paulo, gained a prominent position in this context. Due to its strategic location, it has become one of the main ports for the flow of drugs to consumer markets. This fact caused negative impacts on the public health of the municipality, so much so that in 1988 the city was the record holder for AIDS cases in Brazil, being called the “capital of AIDS” (MESQUITA, 1994). This scenario may also have contributed for the city to stand out in the literature for its pioneering spirit in terms of strategies and implementation of an alcohol and other drug policy in the period from 1989 to 1994, according to Souza (2007).

In an attempt to contain the growing epidemic, under the coordination of Fábio Mesquita, the city of Santos in 1989 announced the first harm reduction program, with the strategy of needle exchange. The main idea, puts Domanico (2006, p. 72), was “since drug users could not give up drug use, that at least they would not get infected by sharing syringes in injecting drug use”. The initiative generated great national controversy, being considered a crime and a stimulant for the use of illicit drugs by the Public Ministry, which embargoed the project and seized the materials (FONSÊNCA, 2012; MESQUITA, 1994).

A series of debates and public meetings aimed at clarifying and sensitizing public opinion about the importance of carrying out harm reduction actions were initiated. In the 1990s, harm reduction gradually established itself as a government policy, linked to the National Program on Sexually Transmitted Diseases and AIDS of the Ministry of Health (PNDST/AIDS-MS) (RIBEIRO, 2013).

In 1991, in Santos, an NGO was created made up of health professionals, many linked to the first initiative, with the objective of developing research on people with AIDS and injecting drug users. These researches provided successive approximations of the users' experiences and knowledge of the rituals of use. As they were prevented from distributing syringes, the technicians sought, based on the findings, to develop alternatives from the perspective of harm reduction, such as the use of sodium hypochlorite to disinfect reused needles and syringes, since when they were used in groups, users they used to wash the syringe to remove traces of blood (DOMANICO, 2006; FONSECA, 2012). It is important to emphasize
that the distribution of inputs was always accompanied by counseling and re-education (DOMANICO, 2006).

The Instituto de Estudos e Pesquisas em AIDS de Santos (IPEAS) became the first Brazilian NGO to adopt the harm reduction method, using the syringe exchange device as a legal method, in 1995. IPEAS professionals became important articulators of the strategies through the sensitization of health managers to the need to use the device, since injecting drug users played an important role in the increase of HIV contamination. In response, health managers in Santos and the State of São Paulo began implementing the strategies (BUENO, 1998 apud SOUZA, 2007).

On December 1, 1995, World AIDS Day, in partnership with five cities in the state, the São Paulo Health Secretary developed the syringe exchange program. The actions included the distribution of prevention kits, which contained two syringes, disposable needles, a container with distilled water, skin disinfectant, 5.25% sodium hypochlorite, a cup and a mixer (SOUZA, 2007). This kit was developed by the harm reduction project that took place in Salvador, also in 1995.

The first systematic harm reduction program developed in the city of Salvador was linked to a study center at the Faculty of Medicine of the Federal University of Bahia. Domanico (2006) observes that the connection with medical studies may have been a favorable factor for the acceptance of the initiative by the community. On the other hand, several criticisms that attributed harm reduction as an incentive to drug use were raised.

The broad mobilization for the implementation of the syringe distribution program did not prevent the actions in Santos from being again embargoed by the legal power. Despite this, IPEAS employees continued to invest in syringe distribution. Police arrests and lawsuits against health workers became frequent. Such challenges, however, have not weakened the movement. According to Souza (2007, p. 71), “after the continuous lawsuits and police persecution, professionals involved with harm reduction invested in a silent intervention method, which, little by little, acquired a voice and visibility”. It is worth mentioning that the clashes about harm reduction echo to this day, generating important reflections that produce advances in the construction of the Policy.

As observed, epidemiological studies on the prevalence of HIV, its rampant growth among injecting drug users, the need to think of health strategies that reach these users, reducing the damage resulting from use and respect for the user, have contributed to the harm reduction to occupy a place in the discussion spaces on the national scene. In addition, its association between AIDS rates and injecting drugs led to the development of actions that articulated these two themes. Harm reduction gained space in intervention programs that were built around the theme “drugs”. Highlighting this crossing is important as the paradigm shift present in the construction of harm reduction begins, defining it as a care strategy for the user of drugs.

Acting through syringe exchange programs allowed health professionals to approach marginalized minorities. From this constant and participatory contact, harm reducers emerged, health agents who work...
in the existential territories of drug users, according to Souza's definition (2007). Within this process, it is worth mentioning the creation of the National Association of Harm Reductionists (ABORDA), in 1997, with the objective of fighting for the rights of harm reduction workers and drug users (DOMANICO, 2006; SOUZA, 2007). It is important to emphasize that the association was composed of users and ex-users of drugs.

ABORDA strengthened the struggle through the training of harm reduction agents and the political organization of users and agents, giving rise to several NGOs that started to articulate harm reduction programs in the country. Souza (2007) emphasizes that harm reduction provided drug users and minority groups with a leading role in public policy decisions, which until then was restricted to the State. More than a care strategy, harm reduction announces its mobilizing effect.

The year 1998 was representative for the development of strategies in Brazil. The country hosted the IX International Conference on Harm Reduction, in the state of São Paulo. At the event, the government made public State Law n. 9,758/97 that authorized the performance of needle exchange actions (RIBEIRO, 2013).

The advent of the São Paulo law was the starting point of a new stage in the history of harm reduction in Brazil, since harm reduction strategies were, from then on, legitimized and assumed as public policy. The repercussion of this measure is immediately felt, with the multiplication of new state and municipal laws, authorizing and regulating harm reduction strategies (RIBEIRO, 2013, p.54).

To end the gains from harm reduction in 1998, REDUC - Brazilian Network for Reduction of Damages, a national organization, was founded, generating the multiplication of harm reduction programs (RIBEIRO, 2013).

The first programs were initially implemented in the states of Rio Grande do Sul, Santa Catarina, Paraná, Rio de Janeiro, Mato Grosso, Mato Grasso do Sul, Ceará, Bahia and the Federal District. Fonseca (2012), when surveying the number of harm reduction projects in Brazil, states that in the year 2000 there were about 100 active projects. In 2003 this number rose to over 150. In 2005 many institutions were closed for lack of funding.

Although associations are in the process of consolidating a political platform, their political sustainability is often compromised by financial sustainability. The main lines of financing for harm reduction came from the National Policy – STD/AIDS, through loans from the World Bank. In 2005, many associations had their actions partially suspended due to lack of funding (SOUZA, 2007, p. 76).

The scarcity of funding, however, was preceded by a milestone for harm reduction: in 2003, the Ministry of Health incorporated harm reduction into the Unified Health System (SUS), considering it as one of its strategies to prevent drug abuse. and drug abuse with actions that transversalized the services of the assistance network, especially basic services, such as the Family Health Strategy (ESF),
and specific ones, such as the Psychosocial Care Center for Alcohol and Drugs (CAPS-AD). Harm reduction distanced itself from its epidemiological character, that is, AIDS ceased to be its focus and crack and other drugs took its place once and for all. Thus, it was included in the responsibility of mental health care (FONSÉCA, 2012).

On July 1, 2005, Ordinance No. 1028 was launched, which determines that actions aimed at reducing social and health damages resulting from the use of products, substances or drugs that cause dependence, be carried out through health actions, aimed at users and dependents who cannot, cannot or do not want to stop using, with the objective of reducing risks without necessarily interfering with the offer. The art. 3 of the ordinance defines that harm reduction actions include comprehensive health care measures, based on (I) information, education and counseling; (II) social and health assistance; and (III) availability of supplies for health protection and prevention of HIV/AIDS and Hepatitis. The development of these actions, according to art.4, aims to encourage the adoption of safer behaviors in the consumption of psychoactive substances.

Legislative and social changes made it possible to develop other forms of intervention added to the initial strategies for distributing new syringes, which could extend care to users of drugs other than injectables. According to Ribeiro (2013), actions aimed at users of inhaled cocaine, with the offer of specific kits for the form of use; advances in research on the therapeutic effect of cannabis and possible replacement therapies (cocaine/cannabis, crack/cannabis); harm reduction related to the use of crack, such as offering pipes for personal use, filters and replacement therapies; harm reduction for the use of synthetic drugs, such as ecstasy, through counseling on ways of safe use to nightclub patrons, who are a consumer public; in addition to appropriate strategies for licit drugs, such as tobacco and alcoholic.

The design of the historical process of harm reduction carried out through clippings found in the literature shows the conceptual expansion suffered over the years. This expresses maturity as a care proposal. But, given what has been discussed, what is harm reduction? If the concept remains incomplete, it is not a flawed narrative or discourse without theoretical foundation, much less speculation. Harm reduction is an open concept that can be linked to any risky behavior in everyday life. Therefore, establishing ready and finished contours is the same as closing, limiting the existence of a construct that is supported by the dynamic complexity and subjectivity of social demands.

The International Harm Reduction Association (2010, p.1) conceives it as follows: “harm reduction refers to policies, programs and practices that primarily aim to reduce the adverse health, social and economic consequences of the use of licit drugs and illicit products, without necessarily reducing their consumption”. In the same way, the Ministry of Health defines harm reduction as “a set of public health measures aimed at minimizing the adverse consequences of drug use, whose fundamental principle is respect for freedom” (BRASIL, 2001, p. 11).

One of the pioneers in the implementation of harm reduction strategies, the researcher Wodak (1998, p. 55), in his reference concept, approaches the proposal as “an attempt to minimize the adverse
consequences of drug consumption from the health point of view”. For Cruz (2006), harm reduction is a strategy to address issues related to drug use that formulates practices that reduce harm to those who use drugs and the social groups with which they live.

For Totugui (2009), the fundamental axis on which harm reduction is based is based on the right of access to services guaranteed by law, in accordance with the provisions of the Federal Constitution, which ensures in its article 196:

> Health is everyone's right and a duty of the State, guaranteed through social and economic policies aimed at reducing the risk of disease and other diseases and at universal and equal access to actions and services for their promotion, protection and recovery (CONSTITUTION OF THE REPUBLIC FEDERATIVA DO BRASIL, 1988, SECTION II, Art. 196).

As presented, harm reduction is a set of strategies that aims to offer health care alternatives that can be adopted without abandoning the practice of drug use. These definitions take the attention away from the psychoactive substance, characteristic of models that demand abstinence and the fight against drugs, to promote care for the subject. For harm reduction, while abstinence is not the user's response, measures that aim at their health need to be adopted, through the access and bond of the drug user to services that promote the reduction of vulnerability and favor social reintegration. It is added that harm reduction is not an invention of the time. It is the product of questions raised about the assistance provided to drug users. Overshadowing the drug, harm reduction contemplates the existence of the subject, and implies respect for their rights and the rescue of their humanity. By transcending technique, harm reduction is consolidated as a way of working based on welcoming, dialogue and co-responsibility (FONSÊCA, 2012).

2 PRINCIPLES AND GUIDELINES FOR ACTION FROM THE PERSPECTIVE OF REDUCING DAMAGE.

Japiassú and Marcondes (2006) define “principle” as the foundation that allows the structuring of knowledge. These “first causes” justify the existence of the known object in order to give it consistency and are evident to the point that their validity cannot be doubted. For Mello (2003), principle is defined as the core commandment of a system, its true foundation, a fundamental disposition that radiates over different standards, composing O spirit and serving in criterion for your exact understanding. These considerations are relevant when the principles and guidelines that support the work in harm reduction are objects of discussion.

As observed in the historical construction, the guiding principle of harm reduction for the approach to the drug user is respect for human dignity. And it is from there that his “principled framework”, as stated by Ribeiro (2013, p. 58), unfolds. The act of giving voice to the subject of rights, giving him the power to claim and implement strategies to improve the quality of life, shows the implication of harm
reduction in the rescue of the user's social participation. Ribeiro (2013) also states that the protagonism of people who use drugs and respect in the attention given to them was already part of the founding principles of harm reduction. This was presented in the first phase, where the users themselves, members of the Dutch junkiebond association, made up the body of militants for the implementation of the strategy.

What unfolds from the founding principle? There is no unanimity regarding the principles that underlie harm reduction. However, there are proposals from authors that articulate and complement elements to support this practice. The expositions of Fonseca (2012) are guidelines for the construction of this topic, as they present in a synthesized, but no less grounded way, ideas that make up the construction of harm reduction politically and ideologically. The author presents five principles that, through approximation and condensation processes, are addressed here in three. Other authors are used to complement the propositions of the author.

The first principle is: harm reduction is not opposed to abstinence (FÔNSECA, 2012; MARLATT, 1999). On the contrary, it admits abstinence as the ideal path, the appropriate one when it comes to drug use, but considering the uniqueness of each subject, their limitations and the complexity involved in drug use, it recognizes that this path is not for everyone. From this perspective, alternatives that minimize harm are welcomed and implemented as long as abstinence is not the user's choice. Fonseca (2012) says that the main characteristic of this principle is the respect for the user's freedom of choice for drug consumption, which must be preserved as long as it does not exceed the freedom of the other. This principle is in accordance with the provisions of the Democratic State of Law, which recognizes the freedom of human action based on their personal convictions, as long as it does not affect the rights of others. Recognition of human dignity prevents the transformation forced of individual, O what no excludes possibilities of carrying out pedagogical work aimed at modifying risk behaviors in safe practices (CARVALHO et al., 2006). For harm reduction, small steps of care are significant to guarantee the subject's quality of life. “The gradual reduction approach encourages the individual who has excessive or high-risk behavior to take one step at a time to reduce the harmful consequences of their behavior” (FONSÉCA, 2012, p. 20).

The second principle concerns the basis that harm reduction finds in empathic pragmatism, thus opposing moralistic idealism (FONSÉCA, 2012; TRAD, 2010). Empathic pragmatism shifts the focus away from substance and use and focuses on producing and rescuing the subject. The issue is not right or wrong, good or bad, unhealthy or healthy, or any other moralistic parameter. The issue is the management of daily demands from a welcoming and attentive listening to the subject. Referring to empathic Experimentalism, Fonseca (2012, p. 22) adds:
Principles and Concepts for development in nowadays society: Transition from Avarice to Caring

The last principle refers to the promotion of low demand and prompt reception to the user of psychoactive substances as an alternative to traditional approaches of high demand (FONSÉCA, 2012; TRAD, 2010; MARLATT, 1999). Traditional models not only impose the premise of abstinence, but also the maintenance of this goal for the provision of continued care. As a result, many users who fail to meet the requirements drop out of treatment and assume living conditions that accentuate their vulnerability. The principle in question points to flexibility in approaching drug users and the need to implement care services that welcome them in a more tolerant way. This implies the establishment of a bond, easy access to guidelines and encouraging the search for assistance services (ALMEIDA, 2003). This principle also addresses the challenging harm reduction proposal of finding the user where he is. Therefore, these devices must have professionals with a comprehensive and inclusive posture, inserted in the territorial reality of the user.

Marlatt (1999) adds a fourth principle, which considers harm reduction to be a “bottom-up” approach, based on addiction advocacy, rather than a “top-down” policy promoted by drug policymakers. Andrade (2002 apud CRUZ, 2006) highlights pragmatism, tolerance and respect for diversity as principles of harm reduction. The pragmatic proposal refers to the public health practice whose objective is to preserve people's lives. The author describes the principle of tolerance as the characteristic of this practice in respecting drug users in their individual choices. Respect for diversity refers to the biological, psychological and sociocultural particularities of each user that affect the interaction with the substance.

These ethical principles find support in our legal system, starting with the Federal Constitution of 1988, which guarantees fundamental rights and guarantees, highlighting citizenship and the dignity of the human person (art. 1, II, III), as mentioned by Ribeiro (2013). Here, fundamental rights meet the principles that support harm reduction. Such considerations raise questions about care models that maximize substance and stifle human subjectivity. In view of this, harm reduction poses the challenge of thinking care strategies that fight social exclusion and seek to rescue human existence, “the objective of harm reduction actions must be social inclusion and the breaking of the marginalization of users of drugs” (FONSÊCA, 2012, p. 23).

MacRae and Gorgulho (2003), exposing the position of the Brazilian Association for Harm Reduction (REduc), bring up the need to understand harm reduction less as a set of practices and norms in the care of drug addicts and more as a posture in relation to the numerous problems related to the way to approach the issue of drugs. Therefore, when discussing guidelines for action in the harm reduction paradigm, the proposal is not to define techniques that lead to a practice, but to refer to a way of working based on an ethical professional-user relationship (ALMEIDA, 2003).

The performance in the perspective of harm reduction considers that the demand is not established "a priori", but from listening to the user in his singularity. As Fonseca clarifies (2012, p. 19), abstinence is...
“recognized as an ideal result, but alternatives that reduce harm are accepted; alternatives that are not defined a priori but in human events”. Dias (2008) suggests that services guided by the logic of harm reduction accept various contracts, such as drug replacement therapies, controlled substance use, among others. Ensuring safe use or with reduced risks, whenever possible, should guide a practice in harm reduction, however, such actions must be established taking into account the issues present in the user’s speech and in the way in which the demands present themselves in this speech. “Recovering the word, history, marks and memories of the drug addict, recognizing their existence and listening to their complaints, needs and demands” (FONSÊCA, 2012, p. 24) is a challenge for harm reduction actions, and this is only possible when care for the subject is centralized, which is different from fitting the person to work.

Another guideline for action is the recognition of the need and possibility of building the action plan in common agreement with the user. Harm reduction programs support a clear proposal of self-care in relation to drug use, investing in a sense of responsibility for oneself. Thus, the objective is to rescue the subject's autonomy and protagonism in the decision-making process and encourage him to take action. Harm reduction is shown as a treatment plan that is built in agreement with the user, expanding the subject's possibilities of adhering, getting involved and initiating behavior change, as Fonseca (2012) adds.

3 OPPOSITIONS TO THE REDUCTION POLICY DAMAGE.

There are two commonly adopted positions on the issue of drugs: the so-called “war on drugs”, which includes the criminal, moralistic and disease model, and harm reduction. The criminal model is expressed in drug control policies that see use and/or distribution as crimes that deserve punishment. The moral model conceives of use as morally incorrect. These two models together collaborate to formulate policies that aim to promote a drug-free society. The main strategy of both the criminal and moralist models is to “reduce supply”, that is, to reduce the availability of products. In turn, the disease model limits drug addiction to biological dysfunction, which needs to be eradicated through treatment programs that aim to remedy craving. In this model, the logic of “demand reduction” operates, with abstinence as its main objective. The alternative to these paradigms is harm reduction, operating by the logic of minimizing individual and social risks related to to consumption in drugs, be they lawful or illicit (FONSÉCA, 2012). The ideologies, benefits and risks associated with the different models have promoted a complex debate regarding assistance policies for users of alcohol and other drugs (ALVES, 2009).

Prohibitionist movements, resulting from the intensification of the trade in psychoactive substances, led to the elaboration of public policies (RIBEIRO, 2013). In the mid-nineteenth century, with an emphasis on moral ideology, the movement to demand a prohibitionist policy came to the fore, as it was considered the best strategy to remedy the social, psychological and biological risks related to drug consumption. In the United States, this policy gained a foundation with the founding of the Prohibitionist Party, in 1869. The alcohol industry grew wildly, culminating in the prohibition of commercialization with
the enactment of Prohibition, in 1920. The repeal of Prohibition, in 1933 was a testament to its failure, but it did not abolish its logic (RODRIGUES, 2014).

Gradually, other drugs such as morphine and heroin, cocaine, marijuana and any substance that could lead to abusive use were targets of commercial repression (ALVES, 2009). The author emphasizes that the entry of the United Nations (UN), in 1945, into the discussions strengthened the cause. In 1946, the UN founded the Commission on Narcotics (CDN) with the aim of formulating policies to repress and control the use and production of psychoactive substances. In 1998, he convened the United Nations General Assembly (UNGASS) to discuss world drug policy. As a goal, UNGASS established a drug-free world for the year 2008, with the campaign entitled “A Drug-Free World: We Can Do It” (ALVES, 2009, p. 2311).

The prohibitionist-punitive model is based on two principles: one of a moral nature, which preaches abstinence as the only relational response of the user to these substances, and another of a hygienist order, which advocates the ideal of a drug-free world (RIBEIRO, 2013, p. 26).

Based on moral criteria and the defense of public health, the “war” was launched. Rodrigues (2014) says that it was not a crusade against inanimate substances – drugs – but against the people who produced and consumed them.

The social cleansing undertaken has its implications for imposed treatments. The condition for the assistance to the user of psychoactive substances of the prohibitionist paradigm, in turn, is characterized as “high demand”. Abstinence is a requirement for the beginning, maintenance and end of treatment, with no middle ground, as Alves (2009, p. 231) says, “the health care model for users of alcohol and other drugs built on the basis of prohibitionist rationality, is characterized, therefore, by the authoritarianism of the proposed interventions”. It is in this sense that Fonseca (2012) will present harm reduction as an alternative to “all or nothing”.

The main criticism of the prohibitionist model is constituted around the limitations of access to prevention and treatment services for people who make harmful use of psychoactive substances, as well as intolerance to relapse or recurrence of use (ALVES, 2009). This posture casts users into two discourses. The first, and most common, is the discourse of the “defeated” user, who seeks help in a subservient way, adhering to any and all imposed strategies. The second discourse is the so-called “victorious” or “heroic”, authorized to people who have overcome the use of drugs. These discourses determine the structure of services provided to drug users, as observed by Petuco (nd).

Harm reduction strategies have been criticized as opposing the abstinence model. As already discussed, this criticism is not supported, since harm reduction works to find the best way for the user and the community, with abstinence being desirable, but not imposed. In this way, the proposal of harm reduction is not to create an alternative and more comfortable discourse for the user, but to allow his/her speech as a subject of rights to be rescued and echo.
Reale (1997), one of the pioneers in the study of the intersection between drugs and harm reduction in the area of public health, created a comparative framework between the prohibitionist model and harm reduction strategies.

Resistance to harm reduction as a strategy to assist drug users is an important aspect of the debate regarding the option for its use. For Totugui (2009, p. 57), positions against harm reduction may be related to a misunderstanding of its concept, premises and applicability. Cruz (2006) presents some motivations for opposing harm reduction strategies:

i. Understanding that their strategies are contradictory, in addition to dispensing with preventive actions, not directing actions to reduce offers or demands;

Cruz (2006), in his work, emphasizes that harm reduction is not contradictory to the use of actions to reduce the supply and consumption of drugs, and citing Stimson and Fitch (2003), the author claims that the difference it is in the handling of the issues, since harm reduction is not intended to solve the problem through general prohibition. This fact is exemplified by campaigns aimed at the use of alcoholic beverages, which propose the dissociation of the act of drinking from the act of driving, without broadly prohibiting the use of alcohol, affirming the preventive nature of harm reduction, as well as the restriction measures. of places for sale and consumption, which implies a reduction in supply and demand.

ii. The understanding that their strategies serve the interests of producers and sellers of drugs;

Mentioning Karam (2003), Cruz (2006) states that attempts to resolve the issues of abusive substance use through repressive actions result in products becoming more expensive, transforming them into a million-dollar business. He adds that this would be a factor that interests producers and agents of the traffic.

iii. The understanding that their strategies are producers of inertia in relation to the frameworks of dependency;
On this idea, Cruz (2006) brings the disagreement that is shown in the work of harm reduction professionals in the face of these situations. The empathic posture of the harm reducer, instead of generating indifference, enables the creation of a bond, often followed by requests for help and referral for assistance.

iv. Understanding that your strategies are permissive;

For Cruz (2006), the idea that harm reduction acts from a permissive practice is not based on facts, since the reality of the implemented institutions and programs involves team discussion and clarification to patients of limits and institution criteria. The author uses as an example the prohibition of drug possession in the institution, which can lead to suspension of activity, but not exclusion in the care process.

v. The understanding that their strategies are messengers of discredit regarding the idea that it is possible to interrupt the use (in the individual scope) or that problems related to the use can be minimized (in the Social).

The author rejects this idea, stating that harm reduction is based on the understanding of the possibility of changing the behavioral pattern of risk in drug consumption, which is configured as interruption of use for many. However, these goals should not be imposed, but built together with the user. On the other hand, many who defend the harm reduction policy have a discourse as radical as those who advocate prohibitionist strategies, idealizing that all people can make moderate use of the drug. Reality shows that many users need to discontinue use to stop the risks and adhere to a form of treatment (CRUZ, 2006). Sensitivity in managing the situation based on listening and observing the user's demand is a challenge for the professional's performance.

4 CONSIDERATIONS FINALS

It is hoped that the reflections presented below will contribute to this practice gaining consistency in the different care services for drug users in which psychology professionals are inserted.

It was found that discussions need to advance in services to promote professional practice in harm reduction. It is not just about presenting the concept for professionals to process, since knowing harm reduction as a proposal is not enough to guarantee action. The paradigmatic proposal of harm reduction translates changes in attitudes and attitudes of professionals in relation to the issue of drugs and, consequently, to the user. For this to happen, along with the presentation of the harm reduction model, it is necessary that culturally rooted concepts about drugs, the subject who consumes them and ways of care undergo a re-signification, which demands more investment in professional training. It is also necessary that the services accept and implement the policy, not only with fragmented actions and harm reduction techniques, but as an expansion to the models of care for drug users.

An isolation of harm reduction in the health field was observed, more precisely in mental health and STD/AIDS services, which is understandable from the analysis of its historical construction. Thus,
expanding in the field of health and having a presence in other sectors is a challenge that is posed for harm reduction.

ABSTRACT
The practice of tolerance is essential in any society, given that diversity is a strong characteristic of the human beings that compose it. Respect for people with their different beliefs, positions, and ways of being in the world is, without a doubt, a value to be cultivated both for the dignity that is proper to each human being and for the maintenance of harmonious coexistence among them, since, man is a social being.

1 INTRODUCTION
The practice of tolerance is essential in any society, given that diversity is a strong characteristic of the human beings that compose it. Respect for people with their different beliefs, positions, and ways of being in the world is, without a doubt, a value to be cultivated both for the dignity that is proper to each human being and for the maintenance of harmonious coexistence among them, since, man is a social being.

The discussion about tolerance is not new. In sixteenth-century France, it was already present among those who argued that the provisional presence of Protestants should be allowed in the country so that it would be able to overcome the crisis it had been facing. (AMARAL, 2008). Authors such as John Locke, Voltaire, and John Stuart Mill, among others, also made their considerations on the subject based on the influence of the modern context in which they lived.

According to SANTOS (2013), in Modernity, there was a strong belief that reason would lead humanity to progress and the construction of a more fair and tolerant society, a belief that was frustrated by the numerous atrocities that occurred in the 20th century, such as the advent of the two World Wars, as well as the emergence of totalitarian regimes.

All this frustration, combined with other events that occurred in the period after the Second World War, such as the phenomenon of globalization, produced radical changes that led to the formation of the contemporary context in which we live, a context marked by phenomena such as pluralism and relativism (PARMEGGIANI, 2004; SCOPINHO, 2007) and by strong opposition to the modern ideal of reaching a universal knowledge capable of leading humanity to progress.
In contemporary society, the call for tolerance has become increasingly strong and frequent. It is not uncommon, nowadays, to see public demonstrations, debates in academic environments, and discussions on social media where the topic of tolerance is the main focus. However, claims or appeals for tolerance are often not accompanied by a clear notion of tolerance.

What does it mean to tolerate? In addition to this not being a simple question to answer, the answer given to it has many implications for society as a whole, since the notion of tolerance that people or different societies adopt directly or indirectly influences how to occur relationships among those who have different beliefs, ways of life and ways of thinking.

Because of this, it is verified how much the notion of tolerance is dear to contemporary society, which makes the discussion of the theme opportune, in our days, as it has been in the past. Discussing tolerance contributes to the enrichment of its notion within society and makes it possible to reflect on how it may be possible to build a society in which there is respect for human beings in their most diverse ways of being in the world. With that in mind, this work proposes to discuss the notions and practices of tolerance in contemporary times using bibliographic research as a methodological procedure.

2 BRIEF HISTORY ABOUT TOLERANCE

Etymologically, the term tolerance comes from the Latin tolerantia, a term derived from the word tolero which means to bear. (BENEDETTI, 2011)

According to Gondim (2011), tolerance can take on multiple meanings, such as a moral virtue or a political practice. The first meaning concerns an attitude of putting up with what is judged as liable to be reprimanded, while the second means a political commitment made so that different peoples, religions and cultures can coexist peacefully.

Both the concept and the notion of tolerance have a strong relationship with the characteristics of the time in which they were conceived, which is not difficult to understand, given that each period, in particular, reveals a predominant way or ways of understanding the reality and the relationships that are established in it.

2.1 16TH CENTURY FRANCE AND THE BIRTH OF TOLERANCE

Conflicts between Catholics and Protestants in 16th century France grew to a state of civil war. In this context, several parties were formed in the country, some composed by conservative Catholics, others by moderate Catholics and still others, composed by both Catholics and Protestants, as was the case of the politiques party. These parties published in the form of treaties, pamphlets, and other resources, discussions on various themes that involved religious issues, among them, the temporary coexistence of two religions in the country so that it could overcome the crisis it had been facing. This is how the emergence of tolerance occurred, as stated by Amaral (2008).
The principle of civil tolerance, particularly defended by the politiques group, was of fundamental importance for the modern State, which applied it as a political instrument to restore peace and order in the kingdom. It is on this basis that Amaral (2008) argues that the modern State was responsible for producing tolerance by using it as an instrument to move away from religion and promote the common good. In the same line of thought, John Locke (1632-1704), one of the forerunners of the Enlightenment, also argued that the separation of Church and State was indispensable for tolerance to be possible.

2.2 JOHN LOCKE – LETTER ON TOLERANCE

The Protestant Reformation, which began in the 16th century, questioned some dogmas of the Catholic Church, moving it away from its position of dominant religion before the State. In England, this reform had particular characteristics: it was promoted through the Act of Supremacy in 1534 by King Henry VIII. According to this document, the Head of Anglican Religion became the Head of State and all subjects were to follow the king’s religion under penalty of treason. Thus began the religious conflicts in England. (GONDIM, 2011).

In his Letter, Locke stated that the reason for the wars of religion that had been going on in the Christian world was not diversity, but the lack of tolerance towards people who professed different beliefs. For the author, mutual tolerance among Christians was the sign of the true church.

Defending freedom of choice, Locke was opposed to opinions that held that the propagation of religion should be done by force of arms. According to the author, it was the role of the Church to be concerned with the salvation of souls, but coercion was the task of the civil magistrate for the preservation of civil goods such as liberty, life and possessions. In this way, Locke defends the distinction of roles and non-interference between Church and State:

I affirm, however, that no matter the source from which its authority springs, being, however, ecclesiastical, it must be confined to the limits of the Church, being in no way able to encompass civil affairs, because the Church itself is totally separated and diversified from the community, and civil affairs. Boundaries from part to part are fixed and immutable. (LOCKE, 1973, p. 16).

According to Locke, the magistrate could even use arguments to convince people of the truth and lead them to salvation, however, this could also be done by anyone else. He defended the human right to exhort, correct and argue through reason about the truth or falsity of a certain opinion, but he insisted on making it clear that arguing and coercing are two different things. According to him, the civil magistrate should not prescribe articles of faith because, if he did not punish violations of a religious nature, his laws would lose their force and, even if they were applied, they would be of no use, since “enlightenment in no way can come from bodily suffering”. (LOCKE, 1973, p. 12).

Having distinguished between the roles of the Church and the civil magistrate, Locke (1973) proposed the duty of each in relation to tolerance. For him, the Church was not obliged to continue welcoming those people who did not obey its laws, however, no excommunicated person should have their
goods confiscated or suffer any kind of physical damage. According to the author, when the magistrate granted the Church the power of the sword, charity and peace were abandoned, however, when he took that power away, he encouraged mutual tolerance.

With regard to the role of the magistrate, he should not tolerate “[...] any doctrines incompatible with human society and contrary to good customs that are necessary for the preservation of society”. (LOCKE, 1973, p. 23). Nor should it forbid from being carried out, in the church, what was legally permitted in the community. Locke also defended the argument that, if the magistrate had the permission granted by law to intervene in religious matters by means of force, this would have no limits, for he would presume that he had the “[..] power to compel everything to conform to the rule of truth invented by him.” (LOCKE, 1973, p. 23).

As you can see, Locke was a strong advocate of the separation of church and state and individual liberty. For him, everyone had the right to have his own belief, and tolerance towards those who had different beliefs was truly rational behavior and that was in accordance with what was preached in the Gospel. It must be remembered, however, that, despite having been an advocate of individual liberty, Locke (1973, p. 29) shows no tolerance for atheists. In the author's words: "Those who deny the existence of God should by no means be tolerated." At this point, the author demonstrates a certain inconsistency in his propositions.

2.5 THE (IN)TOLERANCE IN THE 20TH CENTURY

The 20th century can be pointed out as the one in which intolerance caused the most destruction, thus characterizing it as a deeply painful mark in the history of humanity.

The First World War (1914-1918) led to countless deaths, in addition to leaving millions of them refugees, as stated by Burigana (2014).

The inter-war period (1918-1939) brought the rise of totalitarian regimes which, in turn, were responsible for real massacres in different countries. According to Carson (2013) it is likely that fifty million people died in China during the government of Mao Tse-Tung and approximately twenty million Ukrainians during the Stalin regime.

During the Second World War, Nazism in Germany led by Adolf Hitler produced the massacre of millions of Jews, not to mention gypsies and homosexuals who were also targets of Nazi hatred. (ARENDT, 1989).

After all these atrocities committed in the period between the first war and the end of the second, the United Nations (UN), created in 1945, proclaimed on December 10, 1948, the Universal Declaration of Human Rights, a document whose based on human dignity and stressed equal rights and freedom of belief and expression, committing to the practice of tolerance. (BRAZIL, 2008).

This document served as the basis for the elaboration of another reference on the subject, the Declaration of Principles on Tolerance, published by UNESCO in 1995. In this document, tolerance was
presented as a virtue that promotes peace and combats war, and which rejects dogmatism and absolutism. According to this Declaration, tolerance is not only the recognition of the freedom rights of individuals, but also “the acceptance and appreciation of the richness and diversity of the cultures of our world”. (UNESCO, 1995, p. 11). Your practice means that:

[... ] every person has the free choice of their convictions and accepts that the other enjoys the same freedom. It means accepting the fact that human beings, who are naturally characterized by the diversity of their physical appearance, their situation, their way of expressing themselves, their behavior and their values, they have the right to live in peace and to be who they are. It also means that no one should impose their convictions on others. (UNESCO, 1995, p. 12).

From these two documents it is possible to say that, in the 20th century, the notion of tolerance, in the first place, intended to oppose all types of atrocities committed from the First World War to the end of the Second, and in addition to highlighting the human dignity and the freedom of individuals to express their most diverse beliefs and ways of being, also emphasized the acceptance and appreciation of differences.

3 TOLERANCE: CONTEMPORARY NOTIONS

To understand how tolerance is defined, thought and discussed today, it is necessary to understand the characteristics of the context and contemporary society which, in turn, have a strong relationship with the profound changes that have taken place since the last century. According to Gatti (2005), there is no consensus on how to name the current phase of history in which a new society is produced. Among those who are concerned with understanding the period in which we are living, there are those who agree in calling it Postmodernity, although, for others, the term is not very representative, since it suggests a rupture with Modernity, which has not yet definitely happened, as is the case with Zigmunt Bauman.

Despite these controversies about how to name the current period of history, it is possible to understand it from the study of its characteristics, as well as the context in which it was produced.

With the countless atrocities committed during the totalitarian regimes and the two great wars of the 20th century, the modern dream that human reason would lead humanity to progress and the construction of a more tolerant society was frustrated. After the end of World War II, the world, divided between two rival systems represented by two great powers, the United States and the Soviet Union, still lived under constant tension and fear that a third war would happen.

Azevedo (1993) apud Gatti (2005, p. 599), in his synthesis about the characteristics of Postmodernity, points out that, in its emergence, it was related to a “historical and cultural invalidation of the great analyzes and their resulting reports of emancipation”. The events that took place in the 20th century disqualified the promise of salvation for humanity, according to the author. In this way, “[...] there is great suspicion regarding the ideals of Modernity, due to the failure of the created utopias – whether as
scientific explanations of the real, or as saving propositions – and not carried out in the daily life of modern culture and societies” . (GATTI, 2005, p. 600).

Another characteristic of the postmodern period, according to Azevedo (1993, p. 31) apud Gatti (2005, p. 600), is that, in it, the great epistemological models, which intended to achieve truth, objectivity and universality, they were deconstructed through “indeterminacy, discontinuity, theoretical and ethical pluralism, the proliferation of models and projects”.

Bauman (2001) uses the term Liquid Modernity to refer to the current period of history, because, in his point of view, the term postmodernity only talks about what current society is not, that is, that it is not it's modern, yet it doesn't say anything about what it actually is. For Bauman, what actually exists are two Modernities, which he calls Solid Modernity and Liquid Modernity.

According to the author, Modernity is characterized by the dissolution of solids or structures present in society. It is this argument that he uses to defend the idea that we are still living in Modernity. The difference between the two Modernities, solid and liquid, would then be the fact that, in Solid Modernity, there was indeed an intention to dissolve old structures, but with the intention of “clearing the area for new and improved solids, to replace the inherited set of deficient and defective solids by another set, improved and preferably perfect, and therefore no longer alterable”. (BAUMAN, 2001, p. 9).

With regard to Liquid Modernity, the author uses the metaphor of liquidity to explain why he calls the current phase that way and, thus, characterize and differentiate it from Solid Modernity. Just as fluidity is characteristic of liquids, the fact that they move and change very easily and quickly, in the same way, institutions and the relationships between them and individuals or between them, in today's society, no longer have a solid and durable structure. “The time has come for the liquefaction of patterns of dependence and interaction. They are now malleable to a point that past generations have not experienced [...] but, like all fluids, they do not hold the same shape for long.” (BAUMAN, 2001, p. 14).

Another change also pointed out by Bauman (2001, p. 38) that characterizes the liquid society is the “derelegation and privatization of modernizing tasks and duties”. This means that the responsibility for social improvement previously attributed to reason, understood as the collective property of humanity, has changed its place, becoming related to the individual's self-affirmation. This is reflected in the change in the ethical/political discourse that turns “the focus of that discourse on the right of individuals to remain different and to freely choose their own models of happiness and an adequate way of life”. (BAUMAN, 2001, p. 38).

5 DISCUSSION

In general, the different conceptions of tolerance agree that it would be the acceptance and recognition that others have the right to adopt beliefs, opinions, worldviews and ways of life different from those we ourselves adopt or believe to be the most correct. However, despite such an understanding, it is
still possible to raise some questions, which require a more in-depth discussion on the subject. Among them, the question about the limits of tolerance and where they should be established stands out.

Forst (2009) suggests that these limits should be placed at the point where intolerance begins, but, given this statement, it is possible to question what, in fact, intolerance would be. This is a very relevant issue for the discussion proposed in this work, since it is possible that major problems are generated by the lack of a clear understanding of intolerant actions and behaviors, and even when, due to this lack of clarity, people start to consider all those who disagree with their opinions as intolerant.

Faced with the argument that we cannot tolerate the intolerable or the intolerant, it is necessary to be very careful not to end up labeling individuals as intolerant based on mistaken assumptions. That is why the notion of tolerance, as well as a more in-depth reflection on the subject, is so fundamental for today's society, which has diversity as one of its main characteristics.

When we define tolerance from a relativistic perspective, such as that presented by Maliska and Wolochn (2013), which presupposes the abandonment of absolute truths, it is believed that the most likely thing is that, instead of contributing to the construction of a more tolerant society, we end up having the undesired opposite result, since there are great chances of people being labeled as intolerant for not being able to make this relativization of life and values.

Although the authors present the argument that in the religious context faith does not need to be relativized, but that it is necessary to understand that the faith of a certain person is as absolute as that of another, this is still a relativistic conception. What happens, in practice, is that most people do not consider the beliefs of others as true as their own, although some manage to make this relativization.

It is believed that people are not necessarily intolerant when they do not consider the beliefs and opinions they differ from as true as their own. Intolerance is more likely to be in the attitude of trying to impose your beliefs and opinions on others. Trying to reach the truth or believe in its existence does not necessarily result in intolerance.

The search for tolerance as a supreme value from the relativization of life and values, in turn, can end up producing intolerance. On this, theologian DA Carson had already pointed out in his book “The Intolerance of Tolerance”, published in 2013, where he discusses how the contemporary notion of tolerance, based on a relativist perspective, ends up, paradoxically, producing more intolerance, since it labels all those who cannot give up certain values as intolerant.

This is a characteristic of the contemporary context in which we live, where there is a way of thinking, predominantly linked to a pluralistic and relativistic rationality and a tendency to discredit absolute values, which contributes to the contradictions present in the claims for tolerance, are increasingly stronger.

In this way, Paul Ricoeur's view presented by Xavier (2017) seems to be more coherent in admitting the difficulty in relationships between people with different opinions and characterizing as intolerance the attempt to impose a certain worldview or point of view on others and, as tolerant, that...
behavior of respect for the person with whom we disagree, renouncing the desire to impose our beliefs and opinions on him.

From this notion, it is possible to verify that disagreement is present when talking about tolerance, which in a relativistic view seems to be absent, because, when considering the belief and way of life of the other as true as mine, the degree of disagreement is almost nil. For there to be disagreement, it is necessary to perceive a significantly negative aspect in the belief and view of the other. Thus, we agree with Williams (2009), for whom the practice of tolerance is possible in contexts where people consider opinions contrary to their own to be wrong, but admit that those with whom they disagree have the right to think and live as they wish.

It is not necessary to say that all worldviews are equally true to be tolerant, but it is necessary, as Paul Ricoeur says, to renounce the desire to impose on others the worldview taken as true. And that's not the same thing as trying to convince people that your point of view might be wrong and ours might be right. It is possible, yes, to argue with the intention of convincing without going beyond the limits of tolerance. Just as Locke was keen to make clear in his “Letter on Tolerance”, it is also emphasized here that arguing is different from coercing and that people have the right to dialogue and try to convince one another about certain ideas, beliefs and ways. to see the world, but that it is everyone's duty to accept that the right to disagree is legitimate and that no one should be forced to adopt an opinion or belief with which they disagree.

Following a similar line of reasoning, Quintás (2018) makes a very interesting comment. According to him:

Anyone who gets excited about defending a conviction is criticized for trying to impose it on others in an intolerant way. Is this enthusiastic and reasoned defense of an idea really an attempt at imposition? Of course not. To be excited by a conviction means that one is enriched by it and wants to keep it as a source of fulfillment and happiness. Defending it does not mean imposing it, but wanting to live it and share it with other people. This desire is not coercive at all. It actually has a participatory character. (QUINTÁS, 2018, p. 24).

For the author, a person is tolerant not when he gives up enthusiastically defending his convictions and disagreeing with the opinion of others, but when he is able to hear divergent opinions even though he continues to think that his convictions are closer to the truth than the one he believes. was presented to him. “Anyone who gets excited and tenaciously defends something valuable is undoubtedly willing to change his mind if someone convinces him, based on reasons, that he is wrong.” (QUINTÁS, 2018, p. 24).

Francisco Razzo, in his book “The Totalitarian Imagination”, published in 2016, in which he discusses the dangers of politics as hope, brings a very interesting reflection on how human beings deal with their claims to truth. According to the author, the experience of a feeling of unshakable conviction often leads us to go beyond the scope of personal experience to “throw ourselves firmly into an expectation of a totalizing character and of excluding everything that hinders the achievement of our mental project in the world”. (RAZZO, 2016, p. 90). Also according to the author, this form of dogmatism is not characteristic
of a specific ideology, but of the human being itself. Our ability to construct images of a perfect world can lead us to force others to adapt to such worldviews. This is what he calls the totalitarian imagination.

The tendency of a totalitarian mind is to try to eliminate everything that stands in the way of its project of a perfect world. In this way, it excludes and demotes even to a non-human category those who are seen as barriers or hindrances to reaching the truth. (RAZZO, 2016). It is from this notion that we understand that it is not the belief in the truth that produces intolerance, but what is done with this claim to truth and how this claim affects relationships between people.

The thesis defended by Razzo (2016, p. 116) is that “[...] the totalitarian imagination [...] takes place through the consecration of the formula: “it is not enough to be true for me, it must be true for everyone”. “. This is something that can happen even when someone adopts a relativistic worldview and tries to impose that perspective on others. It is common to defend the argument that a relativistic worldview is the one that most contributes to the construction of a tolerant society, however, when this perspective is imposed on others under threat of being labeled as intolerant to those who disagree with it, the product of this seems to be, in fact, intolerance.

Within this discussion, it is also opportune to emphasize that accepting the existence of differences without seeking to end them does not imply saying that all differences should be tolerated. Like Machado (s/d), it is stated that it is necessary to recognize that, within this great diversity that characterizes human existence, there is a set of values and rights that must be preserved, as well as actions that, in no way, can be accepted, such as rape, pedophilia and murder, for example. However, it is also necessary to recognize together with the author that it is not an easy task to establish this limit between what can or cannot be tolerated.

The political positions in Brazil today are a clear illustration of how the search for tolerance can end up resulting in the intolerance that is so much desired to be eliminated. It doesn't take a very deep investigation on the internet to come to the conclusion that the struggle for tolerance has revealed that people, however well-intentioned they are, have become what they most criticize. It is the paradox of intolerant tolerance pointed out by Carson (2013). In the name of tolerance, people have reduced each other to mere obstacles to the conquest of the long-awaited tolerant society.

In this attempt to make a perfect world project work where intolerance is non-existent, the subject who defends a discordant position is seen as a threat, sometimes seen as the very incarnation of evil that needs to be fought at all costs. In this way, the space for dialogue is almost non-existent and interactions between the parties, most of the time, result in exchanges of offenses. Thus, these interactions by no means represent an authentic discussion, in which, according to Quintás (2018), there is space for the interlocutor to present the arguments that support his opinion. What exists, in fact, are interactions in which no one shows any willingness to listen to what the other side can present as valid, which, according to the author, can quickly turn into fanaticism.
This is a context where the use of the argument that we cannot tolerate the intolerable is quite common. And using the reflection brought by Razzo (2016) that the totalitarian mind seeks to exclude those who hinder the realization of a perfect world, in a context in which tolerance is seen as a supreme value, one of the means of excluding those with whom one disagrees. and which, therefore, are seen as barriers to the project of a tolerant society, is precisely the use of the argument that the intolerable cannot be tolerated. By labeling those who disagree with my opinion as intolerant, I tarnish their image in society so that they don't have the space to express themselves.

Thus, opposing sides seek to exclude each other by accusing each other of being intolerant and rejecting dialogue with each other on the grounds that they cannot tolerate the intolerable. In this attempt to put an end to all threats to the construction of a plural society, which values the rights of citizens while preserving the characteristic diversity of the human being, it is possible to perceive the opposite result, that is, a society in which individuals seek to exclude those of who disagree and where there is only dialogue between those who share the same opinions.

Another example in which this contradiction is present is what happens in the case of the defense of minority rights. It is worth mentioning that the objective here is not to make generalizations and to frame all those who fight for the rights of minorities in this example, nor to try to delegitimize the rights of these people, but only to highlight that this is something that already exists in reality and use the case as an illustration for the proposed discussion. According to Razzo (2016, p. 108), currently, “[...] the radical discourse in defense of “minorities” has become one of the emblematic paradigms of a mentality with a strong totalitarian tendency”. The author states that these groups organize themselves from an agenda of struggles for rights seeking social acceptance, but, in this struggle, they claim the radical transformation of society. In this context, those who are not in favor of this transformation without necessarily being against the guarantee of the rights of those who belong to these groups are, once again, labeled intolerant without having the proper opportunity to present their point of view.

In March 2018, a dissertation entitled “The Basic Human Good of Marriage in the Neoclassical Theory of Natural Law: Practical Reason, Common Good and Law” developed by Dienny Riker, under the guidance of Prof. . Dr. Victor Sales Pinheiro, caused revolts on social media by groups who understood that the work fostered prejudice and violence against the LGBT community.

The dissertation addressed the marriage perspective defended by John Finnis, an Australian philosopher and jurist considered one of the main representatives of natural law in contemporary times. Initially, the work was presented as a research proposal entitled “Marriage: Its Marital Nature and Relevance to the Common Good” for admission to the PPGD. After the student had fulfilled all the criteria established by the PPGD-UFPA regiment, the dissertation was delivered and its defense scheduled for April 4, 2018, which was later postponed due to the repercussion it caused. (ANAJURE, 2018).

Upon becoming aware of the existence of the work and its content, some groups declared to be committed to the struggle for the rights of the LGBT community began a series of demonstrations on social
networks and at UFPA itself, characterizing the research as non-scientific and of a religious nature, as well as contrary to human rights. ( ANAJURE, 2018 )

According to an article published on the “G1 Pará” news portal, the groups that were protesting against the dissertation did not intend to prevent the work from being defended, but only to exercise their right to take a stand against it.

It is not the purpose of this work to investigate in depth the theory on which the research developed by the student is based, as well as those who spoke out against the work did not do so either. However, according to the Doctor in Philosophy and General Theory of Law from USP, Pablo Antonio Lago (2018), who defends the union between people of the same sex, the work developed by the student cannot be considered non-scientific and based on religious doctrines. In an article published by the newspaper “Gazeta do Povo”, he states that the theory developed by Finnis, an author with whom he himself disagrees, is not based on religious or metaphysical explanations. Therefore, it would be a mistake to disqualify the research developed using these arguments.

Although the protesters against the dissertation stated that they had no intention of preventing the defense, the fact is that they questioned the approval of the research by the PPGD-UFPA and, as Pablo Antonio Lago pointed out, without having read the work and presented criticisms of the arguments, that the author presented in the same, from which it appears that, for them, a public educational institution that values human rights should not offer space for the production of research that defends a position against marriage between people of the same sex.

Thus, it is understood that the case is a clear example of intolerance within the academic environment. From the arguments raised by the protesters, it is possible to conclude that, in their view, only those who agree with same-sex marriage can be considered a defender of human rights and that, therefore, there should be no space for dialogue in the academy for those who defend a contrary position. Ultimately, this is an attempt to impose a point of view on others, which, as discussed earlier, is what characterizes intolerant behavior.

And, once again, the argument behind all these protests is that the intolerable should not be tolerated, which, in the case presented, would be the defense of a position contrary to the same-sex marriage. So, again, in the name of tolerance, we try to exclude those with whom we disagree, depriving them of expressing their views in an environment where dialogue should be valued.

A similar case to this occurred in November 2017, when the American philosopher Judith Butler was in Brazil. Butler is one of the main references within the discussions on gender identity, but on the occasion, he was here to participate in the event “Os fins da Democracia” held by Sesc Pompeia. On November 7, 2017, the date on which the event took place, protesters for and against the philosopher gathered to protest in front of the building where it would be held. Before that, an online petition had already been signed by about 320,000 people who took a stand against the coming of the philosopher. ( BETIM, 2017 ).
As much as they did not agree with the theory defended by Butler and had the right to manifest themselves publicly against it, the fact is that when they tried to cancel the event in which the philosopher would participate, in addition to claiming that Butler left Brazil and of the clear demonstrations of hatred during the protests, these groups were representatives of intolerance by seeking to exclude and silence instead of dialoguing and even seriously and coherently refuting the points of view with which they disagree.

6 FINAL CONSIDERATIONS

The present study made it possible to discuss the notion and practice of tolerance in contemporary times. At first, a brief historical presentation was made of how tolerance was discussed over time and later, a presentation of the characteristics of the current period of history was made in order to better understand how tolerance is currently understood.

In the modern period, this notion was closely linked to religious issues, which is not difficult to understand considering that this was a period marked by conflicts of this nature. In addition, discussions on the subject were based on the modern ideal that reason and science would lead humanity to progress and the construction of a more tolerant society, in which individual freedom was respected, an ideal that ended up being frustrated after the events of the 20th century, specifically, the atrocities committed between the beginning of the First World War and the end of the Second. This, together with other factors, ended up resulting in the production of a new context in which a pluralist and relativist way of thinking prevails and which is opposed to the modern ideal of reaching universal knowledge.

The study showed that there is a certain understanding that tolerance is the recognition that others, like me, have the right to have their own beliefs, opinions and ways of life, as well as to express them. Despite this understanding, it is verified, from an analysis of reality, that it is necessary to be very careful when establishing limits for tolerance, especially in view of the suggestion that these limits should be placed where intolerance begins and the argument that the intolerable should not be tolerated, since great problems can be generated when people adopt a shallow notion of tolerance and, based on mistaken assumptions, begin to consider intolerant all those who disagree with their opinions, beliefs and ways of life.

From the analysis of the contemporary context, specifically the Brazilian one, it is possible to find, as seen in the examples presented, different cases in which the search for tolerance, supported by a little-depth notion of it, has contributed to the perpetuation of intolerant practices.

In view of this, a notion of tolerance is defended here, in which the difference is recognized without necessarily trying to eliminate it, although it is necessary that between these differences there is a relevant level of disagreement. Thus, tolerating would be the action of those who recognize the other's right to have beliefs, opinions and ways of life different from their own, even though they see them as a relevantly negative aspect.
In view of everything that has been presented in this work, it is possible to perceive that the problem of lack of tolerance is far from being overcome and, from this, the extreme importance of discussions on this topic today is reaffirmed. It deserves special attention due to the numerous contradictions it presents and the problems that can result from them, among them, the very perpetuation of intolerance in society. Thus, when discussing tolerance, it is possible to identify such contradictions and, in this way, contribute to the construction of a society in which there is space for dialogue and for the expression of differences.

Finally, it reinforces the importance of academic research that proposes to study the topic discussed here, expose its problems and contradictions and the social impacts that they can generate, in addition to seeking proposals to overcome them. The study developed here was limited to discussing the subject through bibliographic research, however it is believed that field research can bring even more enriching contributions to discussions on tolerance. In view of this, an incentive for the development of such studies is left here.

1 INTRODUCTION

South America, at the beginning of the 21st century, has become one of the most attractive markets on the world stage, especially when it comes to commodity exports, because, with the significant increase, under the leadership of agribusiness in Brazil, a series of international political and economic movements are reflected in this part of the South American territory, such as the Agreement between Mercosur and the European Union, with a significant share of \( \frac{1}{4} \) (a quarter) of world commercial transactions.

However, starting from regional and endogenous movements, the consolidation of a link with the Pacific Ocean, starting from Brazil, is in the process of being consolidated, as claimed by various political and private sector leaders, especially in Chile, Brazil, Paraguay and Argentina. There has always been a dream of connecting the two oceans that bathe the coasts of the South American continent. However, under the pressure of economic demands and the opening of alternative routes, and new markets, the manifesto of local governments occurs to create the necessary infrastructure for a new entry of investors, diverse imports, tourism, and exports of agricultural products, such as soybeans, corn, poultry, beef, pork, cellulose, ores, etc...

The union of efforts of the four South American countries, Brazil-Paraguay-Argentina-Chile, appears to be a response to the economic crisis that is plaguing several nations at the beginning of this century and millennium, including in South America. However, the transformations and consequences of

1“IMPORTANCE AND SIGNIFICANCE - MERCOSUR and the EU together represent a GDP of around US$ 20 trillion, approximately 25% of the world economy, and a market of approximately 780 million people. The agreement will constitute one of the largest free trade areas in the world. The EU is MERCOSUR's second trading partner, which is the EU's 8th largest extra-regional partner. Bi-regional trade flow was over US$90 billion in 2018. Brazil exported more than US$42 billion to the EU, approximately 18% of the country's total exports. The EU is the largest foreign investor in MERCOSUR. In 2017, the stock of EU investments in the South American bloc totaled US$ 433 billion. Brazil is the fourth largest destination for extra-bloc foreign direct investment (FDI) in the EU.” (BRAZIL, 2019)
the establishment of a new trade route, an international business corridor, are inevitable, especially regarding social, cultural, and environmental aspects, in addition to intense economic and technological flows.

The emergence of new scenarios, within the scope of a cross-border territory, from this political and economic intervention, in the South American heartland, composed of a set of bioethnic, multicultural origins, natural riches, and fertile fields, is, therefore, the reason for the present study, in the light of the law of sustainable development, in place, which will be outlined and studied below.

2 THE EMERGENCE OF A NEW COMMERCIAL CORRIDOR FROM A CROSS-BORDER TERRITORY OF WEALTH AND AGRICULTURAL PRODUCTION: LATIN AMERICAN INTEGRATION ROUTE (RILA), OR BIOCEANIC CORRIDOR OR ROUTE.

An undeniable fact, given the recent news published by the international press, is that the trade war between the United States and China, in addition to the arm-twisting between the world powers to ensure the top of world trade hegemony, causes great concerns and movements in all the nations of the globe.

The acceleration towards the signing of the agreement between the European Union and Mercosur, which, after about 20 years of unsuccessful negotiations between the European Union and Mercosur, is now in its final phase, is certainly one of those consequences, mentioned above., in search of consolidation of other alternatives and as a mechanism of marketing strategy and defense, in the face of the dynamic movement that has been ravaging all countries and continents, fiercely, in recent times.

Thus, although treated as a regional and merely endogenous fact, the announcement of the construction of three bridges between the borders of Brazil and Paraguay, by their governments, can also accelerate a series of business around the world, through the ports of the Pacific, especially from the west coast of Chile, towards Asian countries, the western part of northern South and Central America, the Caribbean, the United States and Canada.

Among these constructions of border bridges, between Brazil and Paraguay, there is one that will be on the Paraná River, in the Marco das Tres Fronteiras region, which will link the city of Foz do Iguaçu, in the State of Paraná, Brazil, with the city of Presidente Franco., in the Department of Alto Paraná, Paraguay, a project called the Second Border Bridge over the Paraná River (the first is the Friendship Bridge that connects the cities of Foz do Iguaçu, in Brazil, with Ciudad del Este, Department of Alto Paraná, Paraguay). A third bridge 2, also on the border of the two mentioned countries, will be on the Paraguay

2 Acts of the National Congress. I make it known that the National Congress approved, and I, Cássio Cunha Lima, First Vice-President of the Federal Senate, in the exercise of the Presidency, under the terms of the sole paragraph of art. 52 of the Common Rules and item XXVIII of art. 48 of the Internal Regulations of the Federal Senate, I enact the following LEGISLATIVE DECREES No. 110, OF 2018 (*) Approves the text of the Agreement between the Government of the Federative Republic of Brazil and the Government of the Republic of Paraguay for the Construction of an International Highway Bridge over the Paraguay River between the cities of Porto Murtinho and Carmelo Peralta, signed in Brasília, on June 8, 2016. The National Congress decrees: Art. 1 The text of the Agreement between the Government of the Federal Republic of Brazil and the Government of the Republic of Paraguay for the Construction of an International Highway Bridge over the Paraguay River between the cities of Porto Murtinho and Carmelo Peralta, signed in Brasília, on 8 June 2016. Sole paragraph. Pursuant to item
River, connecting the city of Porto Murtinho, in the State of Mato Grosso do Sul, Brazil, with the city of Carmelo Peralta, in the Department of Alto Paraguay. And finally, a border bridge with the same countries, over the Rio Apa, to connect the Brazilian city of Porto Murtinho to the city of San Lazaro in the Department of Concepción.

But, for the purpose of these studies, it is worth noting the extensive and cross-border territorial scope of this third building, and its possible legal consequences, from this possibility of building this announced bridge over the Paraguay River, between Porto Murtinho, Brazil and Carmelo Peralta, Paraguay. Therefore, it is from this land connection that makes it interesting, above all, to analyze the transformation of new social, cultural, historical, economic, environmental, legal phenomena, migratory flows, with the attraction of investments in road, customs and port infrastructure, for the flow of grains, meats, ores and other raw materials for industries and world consumption.

The transformations in the territory, therefore, are for the construction of an economic model in the region that aims to meet growing demands, especially for agricultural production to feed billions of people, in other countries in South, Central, North America, Asia and Oceania, leaving the Brazilian territory, from the Cerrado, Mata Atlantica, Pantanal regions, entering the Paraguayan Chaco region, northern Argentina, the Atacama Desert, the Andes Mountains, until arriving at the ports of northern Chile, Antofagasta, Iquique and Mejillones. And, as an effect of this connection, an intense import is being planned, with entry into this vast territory, of products coming mainly from Asia and the United States.

This regional territory in the heart of South America initially involves four countries, Brazil, Paraguay, Argentina and Chile, and is being called the Biocceanic Route (because it connects the South American east coast in the Atlantic Ocean to the west coast in the Pacific Ocean) or Latin American Integration Route (RILA), the latter being the name preferred by business people and universities, as it will integrate peoples and cultures.

3 THE URGENT NEED FOR LEGAL PAVING, ALONG THE TERRITORY OF THE RILA, AS A CONSOLIDATION OF THE DEMOCRATIC STATE OF LAW IN THE FACE OF GLOBALIZATION

At this point, the main reason for this study, is the emergence of a new territory that, due to its *sui generis multidimensionality*, escapes from the traditional models of State and the classic concept of

---

I of the caput of art. 49 of the Federal Constitution, any acts that may result in a review of the aforementioned Agreement are subject to approval by the National Congress, as well as any complementary adjustments that entail burdens or burdensome commitments to the national patrimony. Art. 2 This Legislative Decree enters into force on the date of its publication. Federal Senate, on April 18, 2018 Senator CASSIO CUNHA LIMA First Vice-President of the Federal Senate, in the exercise of the Presidency (*) The text of the aforementioned Agreement is published in the Federal Senate Gazette of 03/14/2018.” (Official Union Gazette No. 75, of 04.19.2018, Section 1, p. 03).

3In this sense, it is also highlighted: “The world society, which has taken a new form in the course of globalization – and this not only in its economic dimension -, relativizes and interferes in the performance of the national State, since an immense variety of connected places among themselves cross their territorial borders, establishing new social circles, communication networks, market relations and forms of coexistence.” (BECK, 1999).
sovereignty, because, in the face of the new era of globalization, the peoples are subject to new models of social standards, by globalizing impositions, in a network and fully connected, in the face of “... a world of global flows of wealth, power and images, the search for identity, collective or individual, attributed or constructed, becomes the basic source of social meaning” (CASTELLS, 1999).

This is all that is happening in a large part of the planet, as a result of globalization, at the same time that it means progress for the region, but, on the other hand, it shows legal uncertainty 4, for those who have never seen such a huge movement as it is currently happening, as it is one of the last strongholds not yet impacted by the advance of world economic growth, which can mean a world very different from the current scenario, from the current modus vivendi of most of those who were born and still live in this region. In summary, therefore, it is about the last corners not yet interconnected, without the strong global connection, with low population density, intact natural resources, without any access to the great centers, without a doubt, it is a territory that, soon and in a very fast, it will change scenarios, concepts and social and economic behaviors.

However, in some corners of the globe, the connection can occur, it should be noted, with greater or lesser intensity, depending on various political, social, technological or economic factors that cause direct and indirect reflexes.

But, as a means of guaranteeing the necessary legal certainty, in the preservation of goods and rights to the peoples of the territory, in the most diverse themes that involve, for example, human dignity, territorial peace, happiness and economic and social prosperity in a sustainable way, whether in the intense traffic or territorial occupations, therefore, it becomes necessary and urgent, as a matter of priority, broad reflections, debates and construction of legal models that can guide individual, collective, institutional, exploratory relationships in the territory, in a systemic way, which matter for contemporary societies that strive for the Democratic State of Law.

It is observed, for example, that the classic concepts of the Theory of the State start to be relativized in this process of globalization and decentralization of the decision-making process. This process dynamically crosses borders, challenges the rules and principles of the State, threatens sovereignty (RANIERI, 2013), summarized as follows:

“The modern State of the beginning of the 21st century is faced, in its territory and in the international order, with a plurality of decision-making centers and the production of law, non-state or supra-state, which implies the relativization of the centrality, unity and territoriality of power. Its sovereignty is shared or shared with other subjects of the international and regional order, causing the decline of state authority as well as the loss of the monopoly of political power. On the other hand, the prevalence of economics over politics, largely due to processes of transnationalization of input, production, capital, finance and consumption markets, and the loss of state control over the currency, associated with information technology and to the organization of the network society relativized the sovereignty of States.” (RANIERI, 2013).

4“The legal order, which is justified as a mechanism of objective and prescriptive regulation of a society, describes an unreal world to the daily problems and priorities of social groups, whose degree of complexity increases exponentially in a multifaceted society. The consequence is that these groups are alienated from the state legal order and the creation of autochthonous mechanisms for regulation and conflict resolution.” (BARRAL, 2006).
New legal concepts emerge or must be rethought, thus, with globalization and its effects for the relativization, deconstruction or conceptual adaptation of the State and its political power and performance, to the demands of the new times, as seen above. However, as there is no other model, it is still important to defend the existence of the State, as a presupposition of order and organization in contemporary society.

It is therefore urgent to adopt urgent actions of support and caution, in the legal sphere, when this new territorial, multinational, cross-border, multicultural space, with transcontinental reflexes, is born, which involves this part of South America that accounts for 25% of the current transactions with the European Union, not to mention business with other global continents, admitting and immediately inserting the discussions to safeguard the peoples, the territory and the relationships that affect them (locally) and them (of the location).

3.1 INTEGRATION AND STANDARDIZATION OF NORMS AS AN EFFECT OF TRANSNATIONAL LAW: URGENCY TO BUILD LEGAL CERTAINTY IN LOCAL AND TERRITORIAL DEVELOPMENT

Legal integration is based on the assumption that all the rules of the countries involved in the territory, where the Latin American Integration Route is located, will have a broad dialogue to be applied to commercial, social, private and public relations, without requires a substantial change in the original essence of its rules, while standardization predisposes a rectilinear application, but with changes that are necessary to adapt to the greater interests of the agreements, conventions or treaties.

Both legal modalities, integration or standardization of norms, can guarantee the necessary reliability of relations in the territorial scope, which can affect the principles of Public and Private International Law. In the private sphere, a new legal phenomenon called “Transnational Law” (RAMOS, 2016) has emerged, which is of non-state-centric origin, “neither national nor international, but the result of the concatenated action of private entities, with the direct or indirect support of the States”, in an interaction that makes possible the admission of a “global legal pluralism”, whose main characteristics are:

“(i) because it is composed of norms of non-state origin, (ii) aimed at cross-border events, and (iii) because it counts on the consent of the States, either through the recognition of autonomy of will or even the execution of arbitration awards. .”

In this sense, the joining of various spaces and national norms and not their mere internationalization, but something that transcends the old concepts, emerging something totally different from what had been,
thus, generates the so-called transnationalization of rights (BECK, 2001). In the face of an “anarchy, in which globalization and the porosity of political borders form a window of opportunity for certain economic agents to seek full autonomy” (RAMOS, 2016).

The new territory, in the South American Midwest, already beckons with cooperative relations between governments, companies, universities, but conflicts will also arise within society over the course of its existence, where the interests erected by Private International Law, Consequently, they should overflow into the vast ocean of Transnational Law, since the autonomy of private will will be subject, in this tuning fork of integration and legal harmonization necessary for legal certainty, fundamental rights, “equality, access to justice, privacy, among other rights that may clash with the freedom of private economic agents” (RAMOS, 2016).

Customs and customs issues, for example, represent today a very big bottleneck for the fluency that globalized development requires. Outdated methodologies and exaggerated bureaucracy prove the slowness, which contradicts the dynamics required, nowadays, by contemporary societies.

It is necessary to review concepts, especially the internal and national ones, in view of the need for a vision, no longer as a society of norms, generally, with an endogenous and protectionist vision, but, focused on an exogenous, broad, systemic plan, attentive to the latent relationships and the effects of globalization, since the “Law became on one well interchangeable. transposes the borders as if were a product in export. Raisin in one ball national to another, per times infiltrating without visa in Prohibited.” (ALLARD and GARAPON, 2006).

Finally, legal certainty has a central focus, which must be seen from all angles and actors that will participate in this territorial construction, whether private or public, individual or collective, since it projects integrated development “to which the dictates of globalization can only can reinforce the need for a cross-border planning region, which requires a greater effort from its rulers” (PAIXÃO, 2005).

Therefore, for the full consolidation of the development of the RILA, governmental, institutional, academic, business awareness and actions are urgently required, above all, in the construction of agendas from the perspective of Transnational Law and the Democratic State of Law, interconnecting not only physical structures, but the necessary legal environment to ensure peace, stability, dignity and sustainable and prosperous development in the territory.

3.2 RIGHT TO DEVELOPMENT IN THE CONSTITUTIONS OF BRAZIL, PARAGUAY, ARGENTINA AND CHILE: SIMILITUDE AND POSSIBILITY OF TRANSNATIONAL LEGAL INTEGRATION

The Constitution of the Federative Republic of Brazil foreshadows that one of the four fundamental objectives of the Republic is the guarantee of national development, expressed in item II of article 3. The concern with development in Brazil is quite recent (FOLLONI, 2014), even in the legal sphere.
The constitutional concern started, timidly, with the 1967 letter, growing a little with the 1969 amendment. But it is with the current Constitution, of 1988, that there is an intense legal concern with development. The Constitution provides a detailed treatment, conforming the notion of development in a broad sense (technological, economic, social, scientific, cultural, human, urban, educational, personal, national, country development). An interesting fact that the author points out is that until the 1990s, GDP was used to measure development, which shows that until that time, economic growth was synonymous with development. (FOLLONI, 2014, p. 70).

The author also points out that in the Constitution of the Republic, there is a mention of the themes of economic development and social development. However, the themes are linked, and at times the Constitution itself unifies the two terms, such as the expression “economic and social development”. That said, it was argued that one development cannot cancel out the other (FOLLONI, 2014).

This is what is proved when analyzing the themes addressed in the Constitution of the Republic: there is the major premise that is the scope of development as a whole, but that, throughout the titles and chapters that the Major Law addresses, it is perceived that the idea of development is also found when legislating on topics such as the environment, education, research, work, for example (GABARDO, 2009). The 1988 Constitution is the symbol of a socializing project of a people that seeks justice, solidarity and happiness.

Having satisfied, at least for this work, the analysis of the development of the country's Constitution, it is necessary to start with the constitutions of other Latin American countries: Paraguay, Argentina and Chile. To make such a comparison, it is necessary to consider (LEGRAND, 2018), who defends:

“If the Brazilian comparatist wants to understand a question of English law, he cannot be content with analyzing it from a positivist point of view. He must also measure it from the cultural plane. Ultimately, a positive description (such a law, such jurisprudential decisions) explains little or nothing.”

Starting, therefore, for the analysis of the Constitution of the Republic of Paraguay, it is noted that its article 6 foreshadows the quality of life as an objective to be achieved by the State. Therefore, for the objective to be achieved, the article sets out the command that the study of economic and social development with the preservation of the environment and the preservation of the quality of life of the inhabitants is urgent.6

It is interesting to note that, similar to the Brazilian Constitution, its Paraguayan counterpart also prescribes the defense of a right to a healthy environment, as follows:

“The preservation, conservation, recomposition and enhancement of the environment, as well as its reconciliation with comprehensive human development, constitute priority objectives of social

6 “Article 6 - DE LA CALIDAD DE VIDA [...]. The State will also encourage research into the factors of population and their links with social economic development, environmental preservation and the quality of life of the inhabitants.”
It can be seen that the Constitution also has provisions with limited effectiveness that seek to promote development in sectors such as child development (art. 54), the right of youth and youth (art. 56), the right to social development through from education (art. 73) to the promotion of technical education (art. 78) and universities and higher institutes (art. 79).

Regarding education in general, the Paraguayan Constitution, as well as the Brazilian Constitution, considers that education must be taken as a public policy necessary for the achievement of development. In a very similar way to the Brazilian one, the constitution of Paraguay allowed the State to establish policies for education at all levels (either regulating or promoting), guaranteeing, in addition, the protection of autonomy for higher education. (art. 79).

In relation to indigenous protection, a topic that is quite relevant for the countries of the American continent, the Paraguayan Constitution established the right of community property for indigenous peoples to a sufficient extent so that such peoples can promote the development of their way of life, thus guarantee the continuity of indigenous culture and history. Furthermore, it can be seen that such lands are indivisible, non-alienable, imprescriptible and cannot be encumbered or taxed. The defense of the autonomy of such peoples over community lands is strongly defended in the Paraguayan constitution. (art. 64).

The Paraguayan Constitution also considered agrarian reform as a means of rural development to be essential for one of the facets of development (articles 114 and 115), combating unproductive lands (article 116). Also noteworthy is the relevant role of cooperatives as a means of achieving “national economic development” (national economic development) (art. 113).

Considering the multiple faces of development, the Paraguayan Constitution gave importance to national economic development. Thus, the higher law provided for the State to establish programs and policies that guide global economic activity, which will be indicative for the private sector and mandatory compliance for the public sector. (arts. 116 and 117).

Still from the perspective of economic development, the financial organization of the Paraguayan state establishes that state resources, created through taxation, must be applied only and solely for the fulfillment of national interests (art. 178). Furthermore, the creation of taxes must have policies favorable to national development (art. 179).

When analyzing the Constitution of Argentina, it is immediately possible to observe that the Major Norm of that country also seeks to preserve the environment, considering it relevant for human development and future generations. (art. 41). It is also noted the great concern expressed by this Constitution regarding the ethnic and cultural preservation of the Argentine indigenous peoples (art. 75).
A fact that draws a lot of attention in relation to the protection of indigenous peoples is that the Argentine Constitution seeks to recognize the legal personality of their communities (art. 75), something that was not observed in the Constitutions previously analyzed.

Compared to the Constitutions of Brazil and Paraguay, the Constitution of Argentina establishes some national maximum values, similarly, namely:

“provide it conducive to human development, to economic progress with social justice, to the productivity of the national economy, to the generation of employment, to the professional training of workers, to the defense of the value of the money, to the investigation and scientific and technological development, its diffusion and benefit”. (art. 75).

As seen, norms of limited effectiveness were again established, giving powers to the Public Administration to establish the pertinent policies.

Finally, the Chilean Constitution defines that education, in its article 10, has human development as its ultimate goal. Therefore, it will be up to the State to promote the development of education at all levels, as well as to promote scientific and technological research, artistic development and cultural protection.

Finally, in a first analysis, there is the opening that the Constitutions of Brazil, Paraguay, Argentina and Chile, provide for the same direction of common interests, such as the right to development required in the territory of RILA, however, necessary and urgent is the encouragement of more in-depth and punctual analyzes that can be carried out through governmental, business and academic groups or commissions, aiming at their harmonization or normative integration, consequently, the legal certainty and trust of the relationships established in the transnational territory, under comment.

4 FINAL CONSIDERATIONS

The new structure in the heart of South America, which involves the infrastructure that crosses the territories of Brazil, Paraguay, Argentina and Chile, called the Latin American Integration Route (RILA), constitutes a new focus of development, due to the expressive production of commodities, services, tourism and new investments that will transit through it, with all the effects of contemporary globalization.

Several countries, mainly from South America, Central America, North America, Asia and Oceania, will be intensifying their commercial, industrial, technological and academic business exchanges, while the Mercosur and European Union countries are beckoning to major agreements and tariff breaks, placing RILA in a territory of outstanding economic, social and legal evidence.

Among the various obstacles to territorial success and prosperity, it is necessary and urgent to form research, study and action groups, with academic, business and governmental proactivity, on the new rights that should be in force, within the scope of the RILA and the countries affected by its implementation, due to cultural and legal differences, although with a good load of similarity among themselves, however, cry out for a closer look at the obstacles that deserve priority solutions.
Therefore, in the face of this urgent legal paving that is necessary, the issues of legal harmonization and integration and, consequently, following a contemporary tendency to reduce the overwhelming effects of globalization, when the balance between the impulses of economic domination and the law is unbalanced, to free development, with the protection of life, human dignity, the environment, preservation of the multicultural cultures of peoples, with full access to justice and modern technological means, must be stimulated and encouraged by all the actors involved in the consolidation of development sustainable, prosperous and peaceful within the RILA territory: government, business, academia and society.

CHAPTER 100

Homoafetivity in portuguese literature: the case of the novel O Barão de Lavos

1 INTRODUCTION

In this study, we are going to deal with homosexual relationships between men, especially how they are represented in literature and, in a more specific way, in the Portuguese naturalist novel O Barão de Lavos. What is the opposite-sex or same-sex preference? A genetic predisposition or upbringing? A combination of both? The fact is that many, all over the world, continue to have same-sex relationships, and nothing can stop the feelings and practices of such a relationship, mainly because in some there is not even sex. But is there a genetic predisposition to homosexual attraction? Now, sexual behavior in the attraction of the opposite sex has been ‘normalized’ throughout history, however, the predisposition of homosexual desire was, historically, considered abnormal or, let’s say, unnatural.

Curious that, according to Naphy (2006), male prostitutes had sex with male devotees in shrines and temples in West Africa, Cyprus, Corinth, Carthage, Mesopotamia, Phoenicia, Sicily, Egypt, Libya, as well as in ancient times. and modern India, until the beginning of the second half of the 20th century.

The desire to blame someone for homosexuality is deep and typical of many societies, past and present. Another issue discussed would be the “difference” between active and passive homosexuals. In antiquity, the importance fell on the positions exercised by each of the individuals involved in the sexual relationship, as stated by the historian Nussbaum quoted by Naphy (2006, p. 22):

Sex was not (was) in itself morally problematic. Boys and women (were) often treated interchangeably as objects of (masculine) desire. What (was) important socially (was) to penetrate rather than be penetrated. Sexual intercourse (was) understood essentially not as an interaction, but as doing something to someone.

From the millennia before Christ until the Christian era, homosexual practices were an accepted activity in the cultures of the Near East, perceptible in several literary and legal texts where homoaffective...
activity is mentioned. We have the interpretation made by historians about two laws of the Middle Assyrian period, concluding that the homoaffective relationship was not seen as something degenerate and/or pathological, anyone could practice it freely, as long as they did not use violence to carry out the act, namely rape. In the meantime, there was a kind of culture on the sidelines where all kinds of ambiguities, mixtures and transformations were possible.

“Literature is not just a heritage, a closed and static set of texts inscribed in the past, but rather presents itself as an uninterrupted historical process of production of new texts” (AGUIAR E SILVA, 1991, p.14), the arts in general have offered extensive discussion of homosexuality. In the 20th century, more than tens of thousands of male homosexuals were killed in concentration camps by the Nazis. The representation of this, in a valuable text, we find in the play Bent, by Martin Sherman, awarded in the countries in which it was staged, exposing the Nazi persecution of homosexuals and their subhuman daily life in the concentration camp, through Max's trajectory. Let's see the plot: in the 1930s, in Nazi Germany, in the midst of a hunt for homosexuals, young Max tries to flee Berlin, but is captured and sent to a concentration camp, not as a homosexual, but because he is a Jew; there he met Horst, who had been arrested for signing a pro-gay rights manifesto. They live an unexpected and forbidden love story.

When we think that about half a century earlier, we had novels that dealt with homoaffectivity, such as O Barão de Lavos, in Portugal, and Bom-Crioulo, in Brazil, we see the importance of Art, even when it exaggerates the false Naturalist moralism of Abel Botelho, or in the dubious speech of Adolfo Caminha. We see here a very important milestone, at least as an incentive for further reading on the subject. “In Brazil, depositories of the ideals of patriotic tradition and patriarchal values, Brazilian elites have always been very defensive and, therefore, vulnerable to the specter of deviant desire” (TREVISAN, 2018, p.155)

In the novel The Third Travesseiro, by Nelson Luiz de Carvalho (São Paulo, 1998), we meet Marcus, a young man from the middle class, he is dating Renato and thinks about starting a family, but society prevents them. A third character appears. Using an ancient resource, the novel claims that its writing was based on a true story. Renato and Marcus have to deal with Beatriz, the former's ex-girlfriend. A friend of mine, from the public school in Pernambuco, in the late 1990s, was warned by his Department of Education and was almost exonerated for having recommended this book as reading for 3rd year high school students.

But let's go back to the Weimar Republic and the play Bent: there, homosexuals had obtained a kind of protection, because they registered with an organ, by which they were supposed to be protected (from murderous discrimination). What the Nazis wanted was everyone's record to hunt them down, and this persecution continued in the other German regimes that followed Hitler's, until 1969. Noting here that the German government, after World War II, dictated that some homosexuals to serve their sentences to the end. Meanwhile, on the other side of the Atlantic, in 2004, the United States Supreme Court invalidated
the rest of the state laws that prohibited homosexuality, except in the Army. In other countries there have been big changes. In Europe, same-sex unions and LGBTQIA+ rights are being legalized to this day.

In ancient Greece, homosexual relationships were established normally, but not exclusively, but between people of different generations – a younger man was the passive partner of an active, older man. In China (and most of the Far East), the most common homosexual relationship was between a lower-class man in the passive role and an upper-class man in the active role. It is interesting, in order to understand our study, to know a little about the long history of these practices on our planet so that we do not continue with the crime of wanting to punish someone for their homosexual practices and ignorance of their entire social path.

The gods of India, as in Greece and Rome, took on various appearances and showed a great willingness to love and have sex with various individuals, regardless of their sex. [...] The Hindu gods not only have homosexual relationships but also change sex and, what is more interesting, in some cases they can appear in both male and female forms – or even in both forms at the same time. [...] The result is that sex, sexuality and gender are interchangeable throughout the reincarnation cycle, generally speaking, or even within a given incarnation. [...] In fact, it was only with the dominance of Victorian Britain that Indian cultures began to change (NAPHY, 2006, p. 30-31).

Literature, as a whole, deals more with heteronormative relationships. The Western world is guided by Judeo-Christian-Islamic values. In one respect, however, Islam distinguished itself from these religions. For, as stated by Naphy (2006), in the 18th century, poetry and music began to be dominated by men. The same author also cites, in particular, a play with a homoaffective character, where the suffering of the lover who longs to see his beloved again is shown. Let’s look at another book.

The name of the author of the novel _O Barão de Lavos_ is Abel Botelho, and he dedicates the book to his brother (Luís Botelho). The narrative begins with the period “On that open and humid March night, great animation was merrily bubbling up at the end of Rua do Salitre. It was 1867”, that is, 11 years before the time in which the author is writing. Good, we have in our hands, a 19th century European novel about homosexuality, written in Portuguese. Good way to start a romance. Growing excitement, anticipation, spectacular attractions on offer. But the animation continues:

Facing each other, the varieties and the CIRCUS price [...] everyone wanted a ticket [...] the profuse lighting of the two theaters gilded, revamped, lifted the varieties’ octogenarian shoes [...] a man wandered [...] he was in no hurry to get into [...] this tortuous anxiety of someone who is fervently looking for someone [...] The crowd passed by, automatically [...] In their eyes [...] the obstinacy of a desire [...] strong animal concern (BOTELHO, 1982, p. 7-8).

We see that the 3rd person narrator works with a Freudian game of fort da (show/hide). It seems to observe everything from a distance, but imposes subjectivities, too. From the boys who passed quickly to those who stopped, in these the man “stroked them lightly with his arm; he touched his thighs with his cane, as if distracted; he was placed beside them [...] cautious [...] lest someone he knew appear and surprise him” (BOTELHO, 1982, p. 9).
We see that the narrator quickly set up an arbor of orgies, salable and forbidden. Man is called a “night owl hunter”, “tyrannized by a secret vice”, perhaps “fierce melancholy” (BOTELHO, 1982, p. 9). He finds a colonel who greets him: “Bravo, baron!”; the Colonel left and the nobleman took a “boy, 15 years old, dark skin, reddish eye, insinuating type of marauder [...]” selling “goodies” with her basket. When he saw himself being stared at, he approached: “—Do you want pastries, customer?” A “warm cinnamon and butter” smell rose (BOTELHO, 1982, p. 10). The baron insinuates himself, the boy walks away with a “contemptuous tone”. Friend Henrique Paradela appears. Such an appearance during the “twirling mystery of hallucination of his addiction, shamed him, clarified his reason, gave him the measure of his own debasement” (BOTELHO, 1982, p. 11). We see here that the narrator criticizes this type of relationship from the beginning.

The Baron shows himself to be an individualist. “There are several ways to deconstruct, expand the individualist subject, in particular, through identities generated from gender, ethnicity and race, or even social class, nation and culture.” (LOPES, 2002, p. 175). All this adds to the narrative that moves like a whirlwind with a man at the center in an unconventional artistic, sexual and social frenzy.

The text makes it clear that heteronormativity is an inviolable axis. But the man says: “—I’m waiting for some boys... We agreed to come to the circus today... But they take a long time [...] —And Elvira?” asks Henrique’s wife to the Baron. So we assume that he is married (BOTELHO, 1982, p. 11). Leonor says she’s going to buy things for “the little ones” and a gift for a maid who’s getting married “the day after tomorrow” and called her godmother. Here we have a sociological picture in summary. The woman said goodbye, sent the Baron to warn Elvira. “The day after tomorrow, don't miss it” (BOTELHO, p. 12). From inside the circus came the crack of a whip. Inside, the “function” continued “with the usual monotony”: Clowns, trapeze artists, dogs, horses, but “a monolithic Hercules and an acrobat boy, rekindled his pederast instincts” (BOTELHO, 1982, p. 13). It seems that the narrator criticizes and feels the same attraction as the character, paradoxically, [...] the hot dementias of pagan sensualism. Both virile and sweet [...] it hypnotized him [...] black velvet eyes” (BOTELHO, 1982, p. 14). The narrator insists when comparing the eyes and looks with the velvet. “Desire bit his nerves [...] crazy fascination [...] painful [...] Socrates was no longer entirely subjugated, in his first meeting with Alcibiades” (BOTELHO, 1982, p. 14)

By invoking Greece, the narration borders on the obvious, in the midst of what already brings to mind, the famous relationship of the ugliest old man with the most beautiful young man in Athens. The Baron attracts a young man with “big, strong and silky eyelashes” who lets himself be seduced by a few pennies, takes him to a corner, proposes things to him (which the narrator sees from afar and does not hear for the first time), seems to approach. From the nerve center of this first chapter: “—You're crazy!... I don't, sir!” It was raining. The two of them stayed in a corner under the same umbrella. The narrator says that the conversation was “ignoble” (BOTELHO, 1982, p.14). “Infamous project of seduction [...] the boy listened meekly, resigned”. Then the performance ends, the circus audience passes by. The narrator says that among the boys there are some with “well-built bodies” (we see confirmed the dubious attitudes of the narrative.
focus). The Baron gives the boy a gold coin and says “don't miss it! [...] they separate: the pederast, light, proud, with hope radiating in his features; the ephebe, crestfallen, bending over a problem, touching the paving stones, grave, meditating” (BOTELHO, 1982, p. 15). The picture looks clear: prostitution for social reasons. But it is also essential to remember how homophobia began (1300-100 BC)

It is fair here to deal with the biases of this type of relationship, for money or by nature, and how a punishment was ardently sought for this:

Monotheism also had a code (the Mosaic law) that put behavior and “being” in the foreground, enhancing the impact of the acts themselves. In addition, the law also classified as abominable wearing clothes of two types of fabric or sowing two kinds of seeds in a single field – as well as sexual acts between people of the same sex. Finally, the number of situations or acts that could lead to someone being excluded (temporarily or permanently) from the people of Israel was equally eclectic: having defective testicles; being an illegitimate child; suffer from eczema; have nocturnal emission; live in a house with dampness or woodworm. Male prostitutes were often castrated and participated in ceremonies displaying their androgyny and effeminacy. It is quite possible that aversion to homosexuality (or at least its “sacred” version) explains in part why the Bible forbids eunuchs from participating in public assemblies (Deuteronomy 23:2) or transvestism (Deuteronomy, 22):5). Like the Levitical regulations, the story of Sodom must be understood in this context. It is the main biblical account outside the scope of the law that presents opinions about homosexuality. To demonstrate that the main reason for the destruction of Sodom was homosexuality we would have to interpret Ezekiel's "abominable things" as alluding only to homosexuality and thus ignore everything Ezekiel enumerated first. Also, knowing the Hebrew literary method of making a statement and then repeating it for emphasis. The first sentence as the main clause and the second as a reformulation of the first. The Flood was also justified in part by sexual acts (NAPHY, 2006, 39-40).

It is in the light of so much horror and phobias that spread like social cancer that we delve into the reading of Abel Botelho's novel. Knowledge of diegesis can be practical or theoretical. The behavior of a scholar in front of the Portuguese naturalist book O Barão de Lavos reminds us, as always in literary fiction, that there is an animal life, a political one, an artistic one, and that we must, at times, observe the cultural environment interrelated with the work and that, given the literary fact, we can adopt 5 types of behavior: 1) that of a reader interested in understanding the work; 2) that of an analyst, interested in breaking down the work into its elements, with a view to a deep and rigorous understanding of its form and content; 3) the historian, interested in determining the situation of the work in its historical system; 4) that of critic, interested in judging the work, even a very old work, according to scales of value, such as artistic, moral, intellectual, as we are doing here and complementing this with a theoretical look interested in extracting from the work and of everything related to it, general ideas, and to elaborate these ideas with a view to formulating a quasi-theory about what is essential in literary phenomena, remembering that the Theory of Literature has as its object of study, all literary facts. We have to define ourselves: analysis, historiography, criticism or literary theory, we are left with the latter, because it deals with all literary facts.

Let's go back in time once more to follow historical footsteps that lead us to further clarify the researcher interested in the topic.

The last great “Roman” (Byzantine) emperor, Justinian (AD 482-565), introduced the first laws designed specifically to prohibit all types of homosexual relationships. In 533, he placed all
Principles and Concepts for development in nowadays society: Latin american integration route (RILA) and globalization: importance of implementing a transnational legal intelligence

homosexual acts under the law that punished adultery (with death). In 538 and 544, other laws urged all homosexuals to repent of their sins and do penance. Those who continued to be “practicing homosexuals” (to use a current expression) were to be handed over to the mayor (magistrate) of the city. [...] Shortly afterwards, the emperor ordered that all those found guilty of homosexual relations be castrated. [...] From then on, those who felt desire for other men lived in terror (NAPHY, 2006, p. 92-93).

After weaving such observations that lead us to compare times and values, between nobles and commoners, we will start with the genetic structures of the novel *O Barão de Lavos*, its aesthetic-literary categories that condition the work and allow our understanding. Let's establish our method. The theory at this point is not propaedeutic, we can only resort to it, knowing that what concerns us now would not be to use it in the analysis of the structure of the work itself. We do not seek dogmatic, judgmental rules.

2 THE TWO SIDES OF THE COIN

Our study develops in two levels of work. One of a scientific nature (research, analysis of literary facts), another of a philosophical nature (formulation of working hypotheses and theories about the results of this work).

The theoretical knowledge of literary facts is based on the following principles: 1) the creative act, reactions of the reader, this not without literary analysis, nor historiography, nor critical treatment; 2) the theoretical study itself, the form, the work and its influence on the public; 3) speculations about abstract realities of literary life (based on scientific knowledge); 4) objective analysis of the psychological act that created this work, a “trend”, “literary fashion”, as they used to say, and literary analysis; 5) as the theory of literature is a discipline in progress, we want to understand its evolution, its current study, its perspectives. Always remembering that our primary object is the work, the secondary ones are: the cultural environment of the work, the writer, the reader, the public and the literary history of which it is a part.

The public is not only the sum of readers, but also a collective entity, a social group with its own peculiar behavior. However, we can take as an object of study of literary theory its relations with other literary studies (criticism, analysis and literary historiography) and with psychology, linguistics, stylistics, sociology, philosophy, history, aesthetics and ethics dialogue with the theory of literature, a science of the spirit whose object is the literary world created by man over the centuries; sciences such as it cover all domains of multimodal human activity. The theory of literature cannot aspire to the complete objectivity, rigor and exactitude that characterize the exact sciences and the sciences of nature.

In the psychoanalytic sense, in the second half of the 19th century, homosexuality was seen as a perversion, which appears in this novel, *O Barão de Lavos*, a conception that was not unanimous. “The homosexual perversion of psychoanalysis made the sad and pitiful guardian figure of the belle époque [...] an indefensible notion” (COSTA, 1992, p.85).

The question is expressed in this Portuguese naturalist novel. What would be the purpose? Depending on the theoretical point of view adopted, we can see Literature as a means to something or as
an end, as a sign of change or record of an epoch, as a symptom of the evolution – or not – of the human psyche or a trace of which it maintains itself, same over the millennia. This is not to say which theories are right or wrong, just to demonstrate that each part from a different theoretical point of view, and increasingly the starting point is not Literature itself, but Psychoanalysis, Sociology and Linguistics – to give names to the main theories of literary studies.

How to look at the year 1867 (of the narrative or 1888, of the author compared to the work)? We never want to say “that was the way it was in those days”, this is ridiculous in the face of iconic works of the lyrical, narrative or dramatic genres. We want to remember here that a literary study must be democratic, never elitist. The very concept of literature, reading and criticism should not stand between the reader and the work. We must eliminate this repression.

We think that Literature could be defined as writing, in the sense of fiction. Literature uses language in a peculiar way. The formal literary elements would provoke the effect of estrangement, or defamiliarization. Under the pressure of such artifices, common language is intensified, condensed, twisted, reduced, enlarged, inverted, renewing habitual reactions, making objects more perceptible. Result: intensification of our life. In this work by Abel Botelho, sex between men is pointed out as an aberration that fatally leads its practitioners to the most terrible decadence.

How to evaluate, on the other hand, the literary value of this work? Literature is not a stable and well-defined entity. Value judgments in this area are notoriously variable. The act of classifying something as literature is extremely unstable. Interests are constitutive of our knowledge. Naturalism sought to make the pathological study of society in an intense social critique. Value means everything that is considered valuable by certain people in specific situations, according to specific criteria and in the light of certain objectives. What values do we find in the novel O Barão de Lavos?

Literary value judgments can be subjective and self-serving. There is a close relationship between them and social ideologies. But do we interpret Literature, to some extent, in the light of our own interests? Is our reading of O Barão de Lavos today similar to that of the late 19th century, when it was released? Or are literary works rewritten, even if unconsciously, by the societies that read them? What about a person who believes that sex roles have roots only in human biology, as the narrator of the aforementioned novel does?

The beautiful, in Greek tragedy: it was not convenient to show “good” people passing from happiness to misfortune, nor bad men passing from crime to prosperity. Analyzing the character of Baron de LAVOS, trying to define him in terms of our ideas, knowing how abstract the essence of the creative act of this work is, is what interests us. The creative process that produced this work was inside Abel Botelho, it became a portrait.

Another literary fact that we are looking for is the reader (after the author and the work) in his effort to understand (here we will launch our hypotheses, nowadays). There are no recipes for a perfect novel, but creative freedom in this area has its inventive power under the technical aim of an industry that now has a
technology never before achieved and we do not want to despise everything that we are witnessing in the world when analyzing this book that focuses on points that interest us: heteronormativity, homoaffectivity, the issue of pleasure. If we look at how matters were treated in antiquity, we will see remarkable facts such as:

Christianity (along with Judaism and Islam) has traditionally valued procreation over (if not to the exclusion of) pleasure. Indian culture does not have it – understanding rather that pleasure (kama) finds “its purpose in itself”. Pleasure is an end in and of itself. [...] The culture of India, in its many social and religious forms, seems more interested in emotion and love than in the mechanics of procreation. [...] Thus, masculine and feminine are not distinctions of essence, but categories “created by society” to which certain roles are assigned (NAPHY, 2006, p. 45).

In this conception, it is possible to perceive that the sexual act was commonly directed and explained more for the purpose of the reproduction of the species, something that reverberates until today in some communities, excluding the human capacity to feel pleasure, through the climax moment, provoked by the junction of two self-conscious beings entwined in the movement of sensations called eroticism, a concept defended by Bataille in his work Eroticism, discussed later in the body of this book.

3 HOME OF THE PEDERAST

“Good evening, Vivi”, the baroness read Madame Bovary with interest. The second chapter couldn't start more interestingly. He kisses his wife “mechanically”. The narrator chooses modern words. The wife, with “ruffles on her tiny forehead”, smiled at her husband with “kind indifference” (BOTELHO, 1982, p. 18).

Neither Eça nor Machado struck such a precise and comprehensive blow. Madame Bovary, reads the pederast's wife. We already know what's coming, but the linguistic game is tasty, in the sense of Roland Barthes, in The pleasure of the text.

What a book, this one!... – exclaimed the baroness in a deep admiring accent, resuming with delight the interrupted reading [...] I have never read anything that touched me so much!
— Do you know who I saw?... [...] Os Paradelas.
But the baroness, cutting right away:
— Yes, yes ... but let me read” (BOTELHO, 1982, p. 20).

The family is displaced from the usual axis that moves the entire system. The wife reads Bovary and the husband made an appointment with an underage boy, he was going to buy him sex favors. The narrator will examine her, introduce her to the reader: “a delicate woman”, small, fragile, spicy [...] (BOTELHO, 1982, p. 20). We note that the fetish surrounds this narrative. A certain appetizing thing “light and frivolous. Big eyes between gray and green” (BOTELHO, 1982, p. 20), the narrator pulls us to look closely at that woman on the chaise-longue. The eyes

 [...] an all-nothing metallic [...] translucency dry and healthy [...] imperceptible, thin nose, raised at the base in a rivet [...] like a provocative, between malicious and haughty [...] the forehead, clear, smooth [...] there was no news of the passage of a serious thought [...] of a just notion of duty [...]
by the curve of the face, of a crass milky whiteness, the sinuosity of a very tenuous vein rose on either side of the chin to the springs (BOTELHO, 1982, p. 20).

The final superlative seems to us to be an important conclusion to the linguistic game in progress. But the Baron is the protagonist, and not this lady, exposed there, in “a fascinating combination of youth and grace, of petulance and pampering” (BOTELHO, 1982, p. 20). If we were to compare her to Miranda’s wife, in O Cortiço, we would see with what difference the adultery will be consummated. For now, the Baron (we don’t know his name, yet) “brains and hands on fire”, savors the relief of arriving at that “little house” (a small palace, it would be better to say) (BOTELHO, 1982, p. 20). “If the senses were normalized, the soul continued to struggle in a painful exaltation. That silence was exasperating. He wanted to talk, but “Vivi” said this: “Haven’t you been there without me so far?... because it lets me read” (BOTELHO, 1982, p. 20). The linguistic marks are repeated from the first lines: the use of exclamations and interrogations leave the reader in a kind of vacuum that creates an affected rhythm, in a way, in the narrative.

The narrator, still about Vivi (Elvira, who married for her mother’s interest and had no children), reveals to us:

[…] his mouth was creased at the corners, very acrid, and the little veins of his face were slightly thickened purple […] there is a screen, with five panels, of black satin, soberly embroideries of wading birds, hair grasses and fine flowers […] delicate fantasy […] old porcelain […] a grand piano on a platform […] paintings […] in the purest style (BOTELHO, 1982, p. 20).

Again a superlative in the narrator’s speech. The description of some rooms in the house, described in detail, seems to be made to characterize the couple, the social class and prepare the reader to follow the drama of the wives, a kind of duel is announced.

The bored Baron hears Vivi say “there are the newspapers to read” (Ibidem, p. 23). He chooses Gazeta de Portugal, in which he collaborated. “Very far from each other”, he “in addiction”, she “poisoning the senses in Madame Bovary’s dissolving tragedy” (BOTELHO, 1982, p. 23).

In the semantic field, expressions such as “poisoning the senses” (she), “derailing her addiction” (he) abound. But it is still the Baron who is in a worse frenzy than that of Ema Bovary. From the wife we do not have access to what he aspires to, yet. The narrator makes a comment: “It was logical, it derived naturally from nature; from the education of the conditions of connection between the two this mortifying situation” (BOTELHO, 1982, p.23). We know then that the Baron comes, by “double bastard grafting” from two of the oldest and most illustrious families in Portugal and signed “D. Sebastião Pires de Castro e Noronha”, a nobleman with a pedigree, but of a lineage impregnated with vices.

Here we could establish one of the pillars of our theory about the texture of the novel, with regard to the narrators, an essential characteristic of this genre, a fundamental element. We can talk about form,
content, style, not yet about the author, but we can already say that Eça paved the way for Abel's Naturalism, later to Realism. The reader, the public, the cultural environment were already folded, but now the lens turns to the physical attraction between men. And there is a wife at work.

One of the characteristics of the literary work is the type of reality that it conveys: intuitive and individual knowledge, the knowledge that each one of us has of facts and things. We know what goes on inside us (feelings, ideas, imagination) and around us (people's behavior, natural and social phenomena, etc.). The same occurs with the writer, and so we say that his work (like any work of art) expresses his individual and intuitive knowledge of reality.

We cannot forget that when reading a novel, such as this one by Abel Botelho, what characterizes a literary work is, in principle, its content, similar to the common content of people, but which is distinguished by being the result of a deeper and original of reality.

In the literary work, the rules of expression are those created by the artist himself. Content and form distinguish the novel *O Barão de Lavos* as one of the most provocative works of Portuguese literature in the last frontier of the 19th century. Because? Let's investigate.

When elaborating on the figure of D. Sebastião, what an irony to call the Baron he created that way. Botelho does not seem to use subtlety when dealing with his subject. What begins to throb from the beginning of the work seems to border on obviousness without camouflage, although there are prolonged digressions such as the one used to narrate the Baron's origins 300 years earlier. When a Castro kidnapped a virgin, he laughed at a mass and publicly distrusted the Jesuits (1541), in the days of King João III.

Literary theory has been studying the issue of narrative focus diligently. The resurgence of certain aspects has proven effective, at times, as in the narrator's digressions. Machado de Assis gave examples of this in his *Memórias Póstumas de Brás Cuba* and in other works. When delving into the Castro's "romanesque mancebia", defying King João III, at the time of the “outbreak of the sinister autos de fé”, the narrator was perhaps using cunning, planting something to harvest later. This is how the 6th grandfather of our Baron de Lavos was generated. Here comes a key: atavism generating the “constitutional vices”. Let us remember that scientism was at its height in 1888, the year in which the work was written. The “crazy instincts of pederasty” would have been “inoculated and progressively aggravated in Portuguese society by the ethnological modalism of its formation. The sexual inversion of love, the cult of ephebes, the preference given over women to beautiful adolescents, came to us with the Greek and Roman colonization” (BOTELHO, p. 26).

According to the narrator, pederasty was “an obscene invention of Ganymede, a Trojan prince of wonderful beauty [...] a trivial vice throughout the East” (BOTELHO, 1982, p. 27). Note the contradictory game exposed with the word “wonderful”, in the excerpt highlighted above. There are no limits to the exposition and the narrator draws support from Vaschkala, one of the Rigued Upanischads of Indian mythology, when Indra himself abducts the young Medhatithi. Returning to the Romans, he says that the “veil of friendship covered the most infamous blunders” (BOTELHO, p. 27). It seems a text more to attract
Principles and Concepts for development in nowadays society: Latin american integration route (RILA) and globalization: importance of implementing a transnational legal intelligence

than to repudiate such instincts. Reciprocity in sensual enjoyment was the best bond for the hearts of two friends” (BOTELHO, p. 27). This Roman heritage, through a “cruel transfusion” (the narrator always uses superlatives) took place in the Iberian Peninsula under the influence of the colonizers, in the “ druidic twilight of its forests” (BOTELHO, p. 28). It looks like a baroque game, language used in the creation of the text. Something permeated by an evident ambiguity; this homoaffective practice is also mentioned as an Arab heritage, the “strong approximations”, the unavoidable demands” among men, far from women in the “sensory perk of the flesh”. This is to talk about how the Baron's 6th grandfather was born, in a heterosexual affair. Since the “first cardinal” pederast “lowering his contrite eyes before the images of the avenging God” (BOTELHO, 1982, p. 28-29). It seems the Baron represents only evil. When reading The Literature and Evil, by Georges Bataille (1989) we can notice that evil is a recurring theme in literary works and in this way my interest in this study perspective was consolidated.

Freud, in Civilization and Its Discontents, comments on the purpose of human life, a question raised several times without a satisfactory answer:

[... if it were shown that life "has no" purpose, it would lose its value [...] we have the right to discard the question [...] only religion is capable of solving the question of life [...] men want to be happy and remain so [...] this is the principle of pleasure. This principle dominates the functioning of the psychic apparatus from the beginning (FREUD, 1996b, p. 83-84).

When analyzing the character of the Baron, the narrator rubs him with the social phenomena of that space and time. The tour ends to talk about the Baron's childhood, at the age of ten, in high school, when his father, already old, leaves Lisbon to live in Lavos , Sebastião will be educated by Jesuits. The boy was studious and liked to “pick up the beautiful side of things” (BOTELHO, 1982, p. 30). He exchanged “ridiculous” primers, “hasty copulation rehearsals in the bathrooms”.

The descriptions of the agonies of the young Sebastião's homosexuality are made by a narrator who seems to understand a lot about the subject, even when he treats masturbation as “semenal evacuation caused by himself”. At 16, the boy leaves high school for an outside life. Black eyes, narrow shoulders, “wide basin” (BOTELHO, 1982, p. 30-31). He continued in Lisbon, studying at the Polytechnic, away from his father. No mention of his mother. At 20, Sebastião preferred girls to boys. The narrator uses exclamations to talk about the taste for the ineffable, in the incursions into art, the focus of the young man. The narrator praises the painting showing the nudity of Antinous , the emperor's lover (BOTELHO, 1992, p. 33). This reminds us of some aspects of the struggle for such “passions” between equals:

Sexual acts (from masturbation, through fornication, adultery and homosexuality, to bestiality) are simply condemned as sterile, unnatural and sodomic. There is no evidence of a hierarchy of sins with homosexuality at the top. On the contrary, or as far as we can tell, adultery and incest were considered the worst sexual sins imaginable. Thus we see the Council of London (1102), explicitly demanding that sodomy be confessed as a sin. Interestingly, St Anselm (1033-1109; Archbishop of Canterbury ) simply refused to publish the decree, saying in a letter to one of his archdeacons and close friends: “This sin has hitherto been so public that hardly anyone is ashamed of it, and could therefore have incurred it because he was ignorant of its gravity”. The sin could be serious but St. Anselm seems to have shown little interest in taking effective action against it. Furthermore, the
In The Baron of Lavos, the main character traveled through Europe and enjoyed works depicting handsome young men, in the Louvre and other museums. “In 1860, his father died” (BOTELHO, 1982, p. 34). Only child, inherited everything. The “debauchery began, the “physiological deviation [...] was afraid” (Ibidem, p. 35). He married the daughter of a cloth dealer, Elvira, a “lightheaded and ignorant bourgeoisie, futile, not having the strictest understanding of morals [...] narrow intelligence” (Ibidem, p. 35). She was not looking for a “male”, she wanted to marry the noble D. Sebastião and she did so, going to live in the mansion, satisfying her bourgeois aspiration. When we meet them in the first chapter, they had been married for three years.

Literature is a form of knowledge, understanding applied to man and his relations with the universe, to his struggle for assimilating this universe, a way of knowing. In the novel The Baron of Lavos this is portrayed, we see the imitative fiction, the laborious, almost impossible reproduction of the interior landscape that makes up the kaleidoscope of the characters. Abel Botelho sketches a devastating interior panorama of a repressed homosexual subject, seen from the perspective of a society that denied him. It is not a photographic copy, but a tendentious deformation, a fusion of planes, enlargements, exchange of vibrations and effluvia. There we see that artistic knowledge seems unchanged since the most remote times: Botelho uses the weapons of intuition, these have been complicated over time through artistic expression. The senses have not gained new sharpness, the techniques are what sharpened in creation, we are talking about literature here, it is the creation of a supra-reality with deep, singular and personal data of the author’s intuition. The aesthetic emotion comes from the harmony between the originality of the background or the set of new intuitive data and the expressive relief of form. The social and individual framework exposed in this novel is something that demands attention from us today.

The third chapter announces that an “acrid embarrassment”, “annoying”, a “rebarbative turmoil of displeasure”, a uneasiness of dispute “overshadowed that conjugal atmosphere in the appearance so calm [...] the storm was rapidly building up [...] a spark of hatred would spark” (BOTELHO, 1982, p. 38). The use of alliteration in the rest of the text makes us think of the search for a sound effect to join the other resources that the author makes use of, such as the rhythm, somewhat dissolute. But “domestic decorum” is maintained, with reservations, such as the one we saw in chapter one, when Elvira prefers contact with Madame Bovary to talking to her husband who has arrived from a fiery evening.

The next morning the baroness, with her “plump and fresh little body”, looked at the women and gave orders to the waiter, avoiding the gaze of her husband, who also did not want to meet her gaze. The narrator describes the environment, clothes, props and bodies of the characters in detail. Although we have a moralistic narrator, the observations remind us of someone who knows the metiér very well. We don’t have descriptions as specific as the one below, but subtly we could find something similar:
Some practice the perverse act of sodomy by rubbing their penis with their hand (masturbation, mutual or solitary); others rubbing it between the thighs (intercrural sex) of young people (teenagers), which is what they do most nowadays; and rubbing around the anus and introducing the penis into it in the same way as it is introduced into the sexual parts of a woman. People knew what men do to one another. That some important figures of the time had relationships with other men (and women) was also well known. Thus, the amorous adventures of Richard I, Heart of the Lion, King of England (1157-1199), for example, were the subject of much comment. His first known affair (as Duke of Aquitaine) was with Philip II, King of France (1165-1223): They ate every day at the same table and from the same plate, and at night their beds did not separate them. And the King of France loved him as his soul; and they loved each other so much that the King of England (Richard's father, Henry II) was absolutely astonished at the great passion between them, and marveled at it. The Third Lateran Council (1179) specifically prohibited “that (fornication) which is against nature.” Any priest caught in the act of sodomy would be stripped and confined to a monastery for life, while lay people would face excommunication and social exclusion. A royal edict of Castile said that “whoever commits this sin, once proven, both (must) be castrated in front of the entire population… then hung by the legs until death” (NAPHY, 2006, p. 99).

Leaving the historical-scientific side of the text above, and its technical-academic details, we see in Botelho's novel a belle-époque lyricism, when, for example, he describes the first roses of the season, picked in the garden, serve as a narrative counterpart to frivolity. of the woman, malice, in front of her husband who is in a tailcoat, she in a “cashmere robe the color of grain, decorated with cream lace” (Ibidem, p. 38). Her “sour eyes” do not help the reader to take her side in general events. The narrator is calculatingly manipulating the issue from the point of view and the various possibilities of the 3rd person in the narrative pole. “— O daughter [...] — Well! Nothing else was missing. Now call me a child!”. The Baron “gave the woman a stern look of reprimand” and she looked at the ceiling “with a provocative stamp of foot. An elastic and feline trepidation ate his lap” (BOTELHO, 1982, p. 40).

He wants to go out alone, refuses her proposal to go together. She says she would rather not have married someone who doesn't love her. She says she thinks she's a stupid and docile housekeeper to “sew on the buttons of his underwear”. Interesting detail: she talks about her husband's underwear at this moment. “The canaries of the beautiful golden nursery had burst into a chirping mockery” (BOTELHO, 1982, p. 41). How many signs in rotation at the same time! A cornucopia narrator fills the reader's mind with plenty. He slams the door on his way out and she goes to “bury herself in the chaise-longue”, “crying”, “shivering” in her impotent rage”, the “poor creature” suffered that “affront” like “the slamming of a tombstone” closing the tomb” (BOTELHO, 1982, p. 42). Abel Botelho: a master of letters with almost 400 pages more to outline his opinion on homosexuality and adultery in a conservative society, but he does not dispense with cynical synthesis, as in this construction: “He had undone it, thrown it to the sidelines like a point cigar”, she ignored the reason (BOTELHO, 1982, p. 42).

The narrator does not describe their situation in bed. Did not focus on this point. “The tears were crying drop by drop” (BOTELHO, 1982, p. 42). Simplistically tears don't cry, of course. “Despised, humiliated!”, indirect speech – free reigns. The wife begins to draw analogies between her situation and that of Ema Bovary. “His mouth opened in a panic” (BOTELHO, 1982, p. 43); soon recovered her great confidence in her husband, then a character enters the plot: Doroteia, a maid, from
"[..] rogue curiosity", "mouth torn from ear to ear [...] squashed nose – asking:
- Did you call?
- Not me, woman [...] 
- I wanted to apologize, it seemed to me - he ventured [...] do you want something? [...] I am your friend [...] I have served in Lisbon, before that, 6 houses [...] the husbands left [...] the wives went to the window to face others.
- Don't say that, woman! (BOTELHO, 1982, p. 43).

We also notice popular expressions from Portugal at that time and class such as “Tó rola”, used by Doroteia to criticize the baroness for not reacting at that time. The maid, when asked about the time, says something like this: “Lisbon clocks have two hands, I don't know why... In my land, the clock in the church tower has only one hand [...] and we govern- if with him, and regulates very well... now this two is a mess” (p. 46). We are in 1867 and the representation of Portuguese society is implacable. When dismissed by the baroness, “she shot the bitch in the eyes [...] you are like the most!” (BOTELHO, 1982, p. 46).

For Bataille (1989) man differs from other animals: he is guided in society by interdicts, what is prohibited, illicit or immoral. About interdicts Bataille states that they have a dual nature, since each society has its idea of what are considered immoral acts. The author affirms the need to circumvent the interdicts, but never disregard them in their entirety. Evil is not only a means for the self-satisfaction of the damned, but of the moral being as well, as we see below “In this way, Evil, authentically considered, is not only the dream of the wicked, it is in some way the dream of the good.” (BATAILLE, 1989, p.18). Regarding the transgression of interdicts, the author points out that man needs courage to transgress moral laws, but that when acting against them he will feel a sense of accomplishment and ends by comparing the act of transgression of man in his society with the transgressions represented in literary works. , since it is inorganic and thus can say everything (BATAILLE, 1989, p. 22). Prohibitions and transgression would be inseparable, because for there to be transgression it is necessary to have laws, however, prohibitions should not be ignored but violated. The literary text would thus be a kind of violation of interdicts. Botelho brings us something of this violation, at least by exposing the fundamental laws of the Lisbon society of his time. What we read in his work is that evil is not present in choices and attitudes that have their origin in taking material or personal advantages, such acts are selfish, but evil is not exactly the desire to take advantage of something.

Chapter III has about 25 pages that include a romantic description of environments, such as the garden (plants from the tropics, etc.). The interdiscourse with the novel Madame Bovary continues , as we observe Lisbon through the eyes of Elvira, who wants a Rodolfo, similar to that of Ema Bovary (black velvet jacket and white knit shorts and knee-high boots, mounted on a superb black horse).

The Baron was in the Grêmio, not even the risqué scoundrels of French literature, that of the boulevard , which he tried to read, distracted him. A tour of Lisbon follows. He went to the apartment he rented for furtive meetings, in whose “mercenary interior there was not the slightest emotion of family life” (BOTELHO, 1982, p. 49). Here we have a peculiar observation, the bread and fire that characterize a home were lacking. This at a time when homosexuality still held something that could lead someone to a terrible
punishment. The Baron discusses part of the study he had been working on for a long time, and here we present part of our research on the subject:

During the Black Death, Europeans tried to explain why God had punished them so horribly. Many groups began to be singled out as scapegoats. [...] with the help of preachers and moralists it was easy to see that the wrath of God was provoked by sexual immorality. Two groups came to be in the line of fire (literally, at the risk of going to the fire): the sodomites and the prostitutes [...] these groups became the biggest threat to society, the cause of all ills and problems. The solution was eradication. Europe wanted to erase the last vestiges of classical polysexuality or the licentiousness of the high Middle Ages [...] until very late in the 15th century (and in many cases, until the 16th century) brothels were an accepted – and legal – element of the public panorama. The brothels were built with public money and run by a “madam” (often called an “abbess” or “queen of prostitutes”) appointed and sanctioned by the state. Thus, in 1447. Dijon erected a grandiose building to function as the city's brothel. It had quarters for the manager, a spacious living room, and nearly two dozen large bedrooms, all with stone fireplaces. This city of 10,000 souls was very well provided for, with more than 100 legal prostitutes (NAPHY, 2006, p. 105).

The Baron was thirty-two years old. The narrator gives you typical description of naturalism, which even includes acne, to compare how time has done its relentless work on your face. The boy arrives, barefoot, for the appointment at the exit of the circus (chapter 1). The detailed descriptions will continue throughout the narrative. Often excessive. The Baron stripped the 16-year-old boy's torso: “white lap, fleshy [...] plump pectorals [...] like ripe fruit [...] the Baron got inflamed [...] greedy kiss [...] fatal turbulences of sodomite”. Entirely naked the boy was ordered to stand on a dais; “the chest in milky white” (BOTELHO, 1982, p. 54 - 56). The Baron draws a picture of him, who had “the anatomical particularity he was looking for”.

Dozens of boys, women and girls had been there before, on Rua da Rosa, where the Baron would examine their nudity in the realization of his fantasy. There is the boy he saw and harassed, when he suddenly left the circus; to whom he had given a gold coin in advance.

“It is said that only words have a use, not sentences, but at the bottom of each figure lies a sentence, almost always unknown (unconscious?) that is used in the significant economy of the subject in love” (BARTHES, 1991, p.3). The character of the Baron is cunningly constructed by the author through accumulations of small details such as particles that come together. Let's see your next steps.

He put down his pencil, his jaws “oscillated like a carnivore, he went to take the boy in his arms and took refuge with him in the dim light of the alcove...” (BOTELHO, 1982, p. 58). As we see there is no description of the sexual act, yet.

Pause, space, longer between paragraphs, an hour later, comes the dialogue between them. The boy says he has been arrested once, for “robbery”, he was innocent, he complains, “my freedom is worth more than bread!” (BOTELHO, 1982, p. 59). Again the word bread is mentioned in this passage as a sign. The Baron proposes to live there: maintained by him. “I am for whatever you want”, was his reply (BOTELHO, 1982, p. 60). The Baron orders a Miss Ana, who works in the ground floor shop, about the new tenant. It should be noted that sometimes the word Barão is sometimes written with a lowercase and sometimes with a capital letter (mainly in direct speech), as if the reader were allowed the lowercase “b” due to the intimacy
with the character. "She's your maid," says the Baron to the boy, giving him two more gold coins, ordering them to wash themselves well. “The pederast quickly descended the stairs, the light hurting his eyes led him to a certain regret, and he was engulfed in a thousand disastrous concerns” (BOTELHO, 1982, p. 61).

Form and content, fundamental elements of the literary work, in concomitance and unity, translate well the unspeakable of this somewhat vexing situation, to say the least, what is offered in the reader seems like a concrete reality, but it is not, it is just art, concrete. we have only the form of the work, its expression. Content is abstract reality that existed in the author's mind and comes to exist in the reader's mind, through the form and content exposed there (this separation is merely theoretical).

Yes, on average the chapters in this novel are about 25 pages long. In Chapter IV, secondary characters are described with almost pointless whimsy. Elvira and Sebastião are in public, with friends. The futility of the rich, mocking “Lisbon worldliness”; Falstaff was talked about and how “the world was dying between the brothel and the barracks” (BOTELHO, 1982, p. 80). On the way back, in the coupé (carriage), the couple fight, he didn't like to see Elvira getting intimate with Xavier da Câmara, a kind of high society stallion. He humiliates her, calling her a " fan " head. At home he tries to console her for crying, in bed, he was in the next room and came to her: “I love you so much, Vivi!” (BOTELHO, 1982, p. 89).

The reader reads, for the first time, about the couple in bed, where Sebastião exposes the “hyperthermia of his virility to the contact of that young and beautiful woman” (BOTELHO, 1982, p. 90). “Leave me,” she said, to the “sensual contagion of her husband [...] — I beg you, go away. And the BARON lay down, but beside her [...] the two drowned in an intimate embrace – long, sighing, electric – the last harshness of the quarrel” (BOTELHO, 1982, p. 90). Yes, bisexual.

As we have seen: the form, expression or language is a concrete element, structured in the sense of constructed with words and phrases that we can read, analyze objectively. The terms that Elvira, the baron and the narrator use, weave the element that fixes the content and transmits it from the author's spirit to our readers. The content loaded and fixed by the form, on the other hand, is immaterial reality. Actions and characters created by the author's imagination come to exist for us, only in imagination. The meanings, there, are also immaterial.

In his “sinister andromania”, D. Sebastião (sometimes he is called that, sometimes “Barão, by the narrator), in his encounters, with the boy in his apartment on Rua da Rosa, “lubriciously”, many times, after a After a long “scene” with the boy (as the narrator says), the Baron would leave “broken, exhausted, stumbling, with weakened nerves, his eyes sore, his soul humiliated and gloomy” (BOTELHO, 1982, p. 91). The narrator attributes this to the physiological abnormality of that act. As we see the vocabulary selection, along with the combination of signs placed in volatile rotation, lead the reader to a certain frenzy of perverse curiosity. It is cited to

[... the Baron's genital arrogance, his organic evolution to the maximum [...] appetites for penetration and possession that the man ordinarily feels towards the woman [...] however [...] an effeminate movement: his spirit sparked [...] the passivity [...] surrendering, being possessed, enjoyed, being female in short (BOTELHO, 1982, p. 92).]
Here we are entering a psychological probe, which soon assumes the positivist character, pointing out that this was the end of the Baron’s lineage. An “edema of moral nature, purulent, soft, growing treacherously without pain and without itching”. The subtitle of the work itself suggests this deduction (”Social Pathology”). The pathological ruin of the Baron, who inside saw his own horror... “in the obscene depth of his debasement, he came to despise himself” (BOTELHO, 1982, p. 93).

The “healthy movements” with his wife were disturbed by young men who blackmailed him. The months pass with the new boy, in the same “effervescence”, contrary to what happened with the others: “a strange love, “a sick obsession, passion cold as a mirror in the shadows” (BOTELHO, 1982, p. 95). It is here to see how this can be analyzed in terms of instruments of the Theory of Literature: literature is a non-pragmatic discourse. This doesn’t mean they can't be read pragmatically, does it? The idea of clearly distinguishing between the “practical” and “non-practical” ways of relating to language is far from being clear. Literature would be a focus on the way of speaking and not on the reality of what is said. It is a kind of self-referential language. Literature cannot be defined “objectively”. (EAGLETON, 1997, p. 1). There are ordinary people who regard “literature” as writing that looks “beautiful”. (EAGLETON, 1997, p. 14). Literature is not a stable and well-defined entity. Value judgments in this area are notoriously variable. Interests are constitutive of our knowledge. The act of classifying something as literature is extremely unstable. VALUE means everything that is considered valuable by certain people in specific situations, according to specific criteria and in the light of certain objectives.

In his famous study The Practice of Literary Criticism (1929), the critic Ivor Armstrong (IA) Richards (University of Cambridge) sought to demonstrate how subjective and capricious literary judgments can be. (EAGLETON, 1997, p. 21). There is a close relationship between them and social ideologies.

Do we interpret Literature, to some extent, in the light of our own interests? “Our” Homer is not the same as the Homer of the Middle Ages, nor “our” Shakespeare the same as that of this author's contemporaries. Literary works are “rewritten, even if unconsciously, by the societies that read them” (EAGLETON, 1997, p. 17). The claim that knowledge should be value-free is itself a value judgment. (EAGLETON, 1997, p. 17). What about a person who believes that sex roles are rooted only in human biology?

Here we see something that borders on tragic lyricism. The boy was a foundling, the result of sexual relations between a military man and a nun. At ten he left the house of mercy to work as a servant, maritime work, rowing, handling cables that had hardened his hands. He stole from his boss and fled to Lisbon (he came from Aveiros, where he was born). “Today in one neighborhood, tomorrow in another” (BOTELHO, 1982, p. 96), sleeping in the span of bridges or in places like that. He became a street vendor, earning tips. We don't know if the Baron was the first man she slept with. His name is revealed: Eugênio Dias Lebre, nicknamed: the one marked, by a scar near the armpit. He made a lot of money to “put up with” the Baron.

Eugenio had all the best, to his lover's credit. Even his speech was corrected, even though the Baron liked to hear the “plebeisms” coming from the lover's “cherry mouth”, with “a clumsy flavor” (BOTELHO,
1982, p. 99). The Baron wanted to turn him into a dandy and one day introduce him to his acquaintances, as a mockery of a PYGMALION.

Eugênio, who had an “astonishing assimilative faculty”, drew up a plan to get by in life, through the “cynical” baron who taught him everything. The boy learned to use cutlery and other things from the world of the rich. For dozens of pages, the digressions continue: art, history, etc. Time passes and Eugênio takes on a life of its own. Sebastian suffers, but resists. People looked at him imploringly. But in chapter VI this situation breaks out: “Son, do not leave me! [...] do what you want!” (BOTELHO, 1982, p. 131).

Eugênio says he has an affair with a Jewish woman named Ester, who has been “in her life” for six months. The young man wants to go to Sintra with her, the Baron goes with her.

Let's see, the form and content of a work, being different realities, can be theoretically separable, arise from the author's creative act, impose themselves on the readers, form unity, made aware by us together. The images of the Barão's mansion and his apartment with Eugênio jump from the artist's creation to the reader's recreative act, who composes them in his heart, where form and content are concomitant, interactive, interrelated realities. Literary theory has them as a unit, and when it separates them it is to methodize its reflections.

Elvira's mother, D. Jacinta, says that if what the Baron wanted was a slave and not a wife, "let him go to the blacks and get her!" (BOTELHO, 1982, p. 135). Complains about the son-in-law. The narrator takes the opportunity to turn the reader against her: “the armpit smoked a lot of sebaceous and forehead [...] in the large mass of the breast [...] soft [...] the chin, nose and broad face disappeared. face, of her congested [...] bearded matron's head” (BOTELHO, 1982, p. 137).

In one game, the narrator leaves us unaware of the Baron's trip to Sintra, with his boyfriend and a Jewish prostitute. Elvira freaked out, went out into the night in despair, came back depressed. The next day, the Baron invited her boyfriend to the house, to be received by Elvira, who is about to begin her revenge.

The narrative continues with digressions into art, as Oscar Wilde will do in The Picture of Dorian Gray, for pages and pages. Eugênio becomes assiduous and Elvira becomes intimate with him. Eugenio can barely read. Word is that the Baron is a sodomite. Until a close friend, Henrique questions him about Eugênio:

— Do you have with him...?
— No [...] 
— [...] You know what they say [...] you're married. And the Baron, getting irritated: 'What moralistic bores!' [...] 
— Sorry ... (BOTELHO, p. 177).

There was the matter of Xavier da Câmara, who showed himself to be thrown at Elvira at a party, and even wanted to take Eugênio as a lover. The Baron was furious. High society gathers for Elvira's birthday. Too much luxury displayed in the far-fetched narrative, there. Suddenly, someone spoke out loud (Colonel): “I feel disgusted with these people who can like boys...” (BOTELHO, 1982, p. 190). The Baron
surprises everyone and draws attention, saying the opposite, on his wife's birthday. Everyone looked intrigued. The Baron goes on to say that males are more beautiful in nature than females, Xavier da Câmara did not agree with any point and the Baron replied: “Let anyone else disagree with my ideas... but you!*” (BOTELHO, 1982, p. 195). A fight starts, but it breaks up.

Elvira thought Eugenio was a soapy imbecile. The latter, with the money that the Baron gave him, rented a house for his lover Ester, the reader knows little about their relationship. The narrator describes the entire homosexual act with contempt and prejudice: the lover Ester knew that “the sodomitic origin came to her abundance” that Eugênio offered her “but he didn't care” (BOTELHO, 1982, p. 203).

For several pages the narrative yields to the Lisbon chronicle. The city is portrayed in a picturesque way, for example from pages 207 to 218, a June night in the City Center. The baroness begins to feel attracted to her husband's lover, he gets into a duel and is injured, which leaves the boy with more free time. Elvira thus begins to give in to Eugênio's tempting beauty. She thinks of adultery for “this handsome young man, primitive and blunt” (BOTELHO, 1982, p. 240). The baron asks that they call themselves cousins. The boy wanted to “possess, enjoy the baroness!” (BOTELHO, 1982, p. 242). The Baron did not notice, convalescing from the wound he suffered in the duel. Care in bed for lover and wife.

We have here the literary work as a (more or less arbitrary?) gathering of artifices in the use of images, rhythm, syntax, narrative techniques, in short, formal literary elements that would provoke the effect of “strangeness”, or defamiliarization. Under the pressure of such artifices, ordinary language was intensified, condensed, twisted, reduced, enlarged, inverted, renewing habitual reactions, making objects more perceptible. Result: intensification of our material life, in the words of Eagleton (1997, p.42). The narrator from the middle of the book onwards delves more into the characters Eugênio and Elvira, but there are also excessive landscape/environment discretions. This one was with the baron for a season on Figueira beach. He wrote letters to Eugene, who mocked them with his lover Esther. I burned such correspondence, most of the time, without reading it. The narrator does not fail to opine on the side of convenience. We imagine that it must not have been easy for Botelho to publish his work so full of information about the Lisbon of his time compared to so many other cities and times.

For Naphy (2016), throughout history and around the world homosexuality is less common than heterosexuality (the attraction and sexual acts between people of the opposite sex). However, this is clearly a very real feature of the human species as a whole. The existence of same-sex people is, in other words, a natural component of humanity – it is a normal feature of the human condition. “We emphasize that Christianity has always had a very negative attitude towards sex in general” (NAPHY, 2006, p. 284): (Christian dichotomy between the spirit and the flesh), an explicit desire to “mortify” the carnal side, repulsion non-procreative sexual activities; Is this an extreme example of the imperialist propagation of Western culture and values in general, when the vast majority of cultures have recognized that homosexual attraction is only one facet of the human condition? Is homosexuality abnormal, unnatural?
Upon returning to Lisbon, the baroness gave in to adultery: “Eugênio touched the back of the baroness' neck with his lips on fire” and confessed “I love her very much [...] it's time, Elvira, let's go!” (BOTELHO, 1982, p. 271); the baroness gave in to “Eugênio's masculine audacity” (BOTELHO, 1982, p. 274). In “dialectical sum, the barones hesitated and became fixed again [...] it was dialectical fascination” (BOTELHO, 1982, p. 277). The baron arrived later, Elvira had had sex with Eugenio.

Society perceives the triangle. Elvira did not suspect her husband. This seems like a plot flaw until more than halfway through the book, but this ruse won't last long. Eugenio asks her for money, too, who had to sell many of her things to give him more and more money. He was filled with debts.

Elvira confesses to her mother that the young man has led her to ruin and blackmails her. The baron suspects she has a lover, something hinted at by the eavesdropping maid, Doroteia. “Marry, marry. What nonsense! Out of the capital mistake of his life! [...] life was for everyone to enjoy [...] lavishly!” (BOTELHO, 1982, p. 300-301). He thinks about sending his wife away and staying with Eugênio. But when he was sure that his wife's lover was Eugenio, that the two were having an affair, his life became hell. Here the narrator almost transforms everything into melodrama, but wins the naturalist aesthetic. He hatches a plan: he wanted to catch the two of them; his wife and Eugênio, in the compromising situation. He pretended he was going away and came back later, surreptitiously. And he saw it all: the two of them in the nakedness of the act. Elvira curled up at his feet, and he showed her a revolver and locked the door as she entered. Eugene ran away. The baron followed him. He ended up at his friend Henrique's house, to whom, in a state of shock, he told everything about his “secret” life.

Meanwhile, a friend goes to the baron's house and tells him that the whole town knew about her husband's affair with Eugenio. “Such astonishment struck Elvira to death. Crushed with astonishment and pain.” (BOTELHO, 1982, p. 347).

“A whole little mythology tends to make us believe that pleasure (and singularly the pleasure of the text) is an idea of the right [...] .30). We are here before the representation of hedonism, yes. The Baron only thinks of running away and, like someone who leaves a dirty garment, puts on a clean one. Refusing to go down to “judicial separation”, he notified his wife that he would no longer live with her. (BOTELHO, 1982, p. 349). The narrative leaps from one paragraph to the next of this climax and will become more and more bitter and scorching: after six months, we understand that the Baron has gone to live far away. “On his return, the baron was as good as new. Entire amnesia of the past. It was transfigured. He was now another character, a man from afar, a stranger, an ignorant” (Ibidem, p. 350). He decided to own a photographic studio and work on the artistic nude, but he did not find models.

In chapter XIV (p. 369) we know that Eugênio is going to make his debut as an actor in an operetta. He had spent time abroad with a woman from whom he had “sucked contos de réis”. And the night of that premiere comes. He came in with a tight jersey, sang and was applauded. He had become famous for his scandalous affair with the Baron and the Baroness. The Baron gave a standing ovation and went to all the performances.
Carnival comes, the “Entrudo”. The baron took another boy to a cheap hotel to have sex. After the act, he asks: “—Has no one ever done this to you? To which the boy, who replied, buttoning himself up: — Just yesterday... a priest. It was black” (BOTELHO, 1982, p. 350).

Typical of Naturalism, the description of the act is made in a shocking way and the narrative loses vigor, slowing down: “the baron’s life drags on, torporous and dreary [...] madness and childhood” (BOTELHO, 1982, p. 382). The main character let his passions dominate him: “he had the corruption of the century in his soul” (p. 582). The anti-hero is identified as lonely, selfish, unoccupied, without a family: “hungry to enjoy” (BOTELHO, 1982, p. 383). The only thing he kept was his precious O stamp. abduction of Ganymede, the only thing left from the collection of the old mansion.

His food came from his friends. His friend the Marquis gave him an allowance. Even so, the baron asked one and the other. He sneaked through the streets only at night. The narrator speaks of an “erectism crisis” or even “the last contortions of his sinister tarantular” (BOTELHO, p. 388). Serious problems with the kidneys, chest, intestines, tendons, tingling, gastric crisis, bilious vomiting, sciatica, diabetes. He fainted, couldn't control his body, didn't feel his feet, in short: total decay. The clinical picture indicated paralysis and death. An ordeal. At the same time , he was tormented by priapism, bulimia, “seminal spills [...] like an ape, he masturbated, he began to prostitute himself, he thought about begging. He was in epileptic fits of pain and despair. It was man's sputum.” (BOTELHO, 1982, p. 94)

If the character Eugênio only reappeared in a small passage, after almost a hundred pages, the same happens with the Baroness Elvira, who only reappears in the last chapter, the number XVII: remembering the “all animal passion” for Eugenio, already overcome. She rekindled her friendship with an old boyfriend, and continues in this “discreet and sweet” affection. He was forty years old (BOTELHO, 1982, p. 408).

Later, in the last pages of the novel, the baron appears “an old man”, thinking of suicide. He died mocked by some boys, the old baron on the street, “an old man, withered [...] it was a policeman to help [...] he imagined a drunk, he faced a corpse”. (BOTELHO, 1982, p. 415), are the final words. And then comes the time the author spent writing the book: “March 1888 to May 1889”.

4 THE BARON’S DRAMA

The Baron de Lavos catches us in the midst of a whirlwind, a tangle of threads giving knots that are almost impossible to untie, overlapping images of a humanity that both in the West and in the East, both in ancient and newer civilizations of a subject considered taboo. Let's think about the following examples, some of them with data provided by Naphy:

Around 1900, another Zulu chief followed Chaka's example, ordering his soldiers to abstain from sex with women. “Nngoloza” Mathebula (1867-1948), also known as “King Nineveh”, led a resistance movement against whites in South Africa. Older soldiers (Ikhela) were to choose teenage boys (abafuna) as “boy-wives” (izinkotshone). When he was arrested and tried, he said that homosexual acts were common among his warriors. [...] Two features of the colonial mentality further complicate attempts to identify the presence of homosexuality in Zimbabwe. First, although
they wanted to control the sexual behavior of whites to avoid scandal, the British also had a tendency to avoid public debates about the sodomy trials (NAPHY, 2006, p. 237 – 240).

Let's go back to Botelho and his work. We know that form and content are together in the author, not in a profound way, as he strives to express the (emotional?) state that dominates him in intuition and creative technique. But there is something unspeakable there. Thus, the work triggers in the viewer a complex system of reflexive reactions, different to each one of them.

5 CONCLUSION

In a language with extremely far-fetched passages and others simple and direct, we have the portrait of a character that borders on caricature, due to his affectation, forged by the partial narrative when dealing with certain problems of homosexuality. It gets to the point where the wife, described as “bourgeoisite”, will present her weapons. If Eugênio, the “ephebe”, has already foreshadowed his outbursts, now it will be the voice of the character Elvira to express what she came for. What are the author's intentions in taking the narrative to this level?

Let us reason: the content of a literary work (and its form), what is in the lines, between the lines and what is silenced, all this also deals with the undefinable and the unspeakable. The fiction writer strives to express what he says and not what he wants to say to the reader. He says so, but the literary phenomenon is more than that.

The characters' attitudes produce a reaction in us: “how do you say that? What's that? Because? These are questions that we are asking ourselves, as readers. To what extent is what we read not what we have in us? We can find in the work moments similar to certain memories of our own, about ourselves or others we know. The drama of the Baron and his wife is closed in a perverse triangle, under the eyes of a society that deals very badly with this very complex problem called homoaffectivity, which, as far as is known, is timeless and universal.

The written novel is a material reality, a concrete fact that, when read, will transform itself in us into an abstract reality. The basis of the narrative is the linguistic structure (written or spoken). The writer varies the expressive structure of the works, this structure can be very varied, as for the levels of expression (popular, erudite, etc.) it sometimes depends on the type of content the writer wants to convey. Ariano Suassuna in his comedies sought the structure of popular speech, he did this with an effective technical effort to make the reader feel and understand his work. Abel represents the spirit of his time, the language of his time, the concern with the stigmatic “Social Pathology”.

Our literary analysis focused on the structure of the work, verifying how the author worked with the linguistic materials. It is not just grammar that matters, but the manipulation of these linguistic materials, as in any literary work, which will also give value to works such as this one, O Barão de Lavos, where writing blazes with devastating and acidic excitement, the to enjoy and suffer, in the tail of instincts, in the
“fever of burning lust”, to quote an expression of the author who thus inscribed his name in the list of classics of Portuguese Literature.

ABSTRACT

This essay presents an analysis of the qualitative methodology used in research in Education, and particularly in Mathematics Education, from perspectives focused on research in Teacher Training and Teacher Professional Development. The theoretical contribution that underlies this chapter is guided by the investigations of Marli André, Bernadete Gatti, Dalila Andrade, Lee Shulman and Carlos Marcelo Garcia in order to understand the intentionality of the educational matrices that permeate the theme in the intricate subject/object interaction. In the analysis developed, based on a bibliographic review of a qualitative nature, the articulation between the highlighted lines of investigation: teacher training and teacher professional development, is configured by processes that intertwine in the trajectory of teacher professionalization, which is conceived as a means of constructing the identity of teachers and professors. Professional development considers not only the intellectual aspect, but also the different ways and languages through which subjects learn and build their identities, their ways of being in the world, in contact with other people, with the environment and with society. In this sense, our proposal is to emphasize the relevance of the qualitative approach in research due to the frequent uses, having the knowledge that the spectrum of qualitative research techniques is wide due to its high capacity to add knowledge and meanings to the phenomena studied. The established debate encourages researchers, particularly those in the area of Mathematics Education, to face the challenges established by the new educational conditions experienced in contemporary society.

Keywords: Qualitative approach in research; Teacher training; Teacher Professional Development; Lesson Studies Study ; Mathematics Education.

1 INTRODUCTION

The theoretical contribution that guides this chapter is constituted by the cast of authors whose productions are focused on qualitative research in an intricate subject/object interaction. In this way, we propose to emphasize the relevance of the qualitative approach in research due to its frequent uses, knowing that the spectrum of qualitative research techniques is wide due to its high capacity to add knowledge and meanings to the studied phenomena that allow dimensioning a corpus to the investigation questions.

Our understanding is that studies on teacher education can contribute to the unveiling of certain phenomena or objects of investigation that, based on a qualitative perspective, allow us to apprehend and understand the desires and expectations of teachers.
The current experiences of teachers, training spaces, learning communities and varied field experiences mobilize general questions that permeate our thoughts and lead our writings supported by an extensive knowledge base that aims to promote the understanding of the formation (initial and continuous) of teachers.

It is worth mentioning that qualitative research has become important in Mathematics Education in several lines of research such as: Teacher Training; History of Mathematics; History of Science and Mathematics Teaching; Psychology of Mathematics Education; Didactics of Mathematics, among others.

Thus, in this chapter, we present, as a product of our investigation, a bibliographic and documentary review of qualitative research in the Human Sciences with the objective of listing some reflections of scholars on the panorama of the development of academic investigations that use the qualitative perspective in the field of Mathematics Education.

Therefore, we emphasize that our investigation is based on the following assumptions: research, as an educational and scientific principle, must permeate the training and pedagogical practice of teachers who work in basic and higher education; the exploratory and subjective character crosses qualitative research and teacher training takes place throughout life. Therefore, theoretical studies must reach teachers' knowledge in order to support their practices in the classroom.

This chapter is structured as follows: at first, we seek to present our motivation for the present study and the historical and philosophical foundations of the qualitative approach to research in Education that underpin the modalities of qualitative research developed, especially in the region of inquiry of Mathematics Education.

In the following sections, we list some research related to the training (initial and continuing) of teachers that unfolds for an understanding of Teacher Professional Development that can support the current debate around the pedagogical practice in Mathematics. Finally, we bring a reflection on Lesson Study (class studies) which, centered on the pillars of professional development and student protagonism, promotes the learning of mathematics among students with the perspective of learning mathematics teaching among teachers.

2 QUALITATIVE RESEARCH APPROACH IN SCHOOL CONTEXTS

The qualitative approach to research in education has been and has been the subject of multiple interpretations arising from different conceptions and possibilities of studying the phenomena that involve human beings and the intricate social relationships that are established in different environments.

The historical origin of this approach based on the question whether the method of investigation of the physical and natural sciences should continue to be the model for studying human and social phenomena, together with the foundations of a positivist approach to knowledge, began to drive researchers in favor of a hermeneutic approach concerned with the interpretation of meanings contained in everyday life and their interrelationships.
From this perspective, the focus of investigation centered on understanding the meanings attributed by subjects to their actions within a context and on principles that the qualitative approach to research in education advocates, we assume as a presupposition of this study that human experience is mediated by interpretation.

Very close to symbolic interactionism, which constitutes a theoretical perspective for understanding the way in which social actors interpret the objects and other people with whom they interact and how such a process of interpretation leads individual behavior in specific situations, was developed, in Anthropology, a trend known as ethnography whose central concern is focused on the meanings that actions and events have for the people or groups studied.

Ethnographic research places emphasis on the process, on what is taking place rather than on the product or end results. The ethnographer tries to capture and portray the personal vision of the participants and has the task of gradually seeking to approach the ways of understanding the reality of the studied group, sharing with them the meanings elaborated.

Although these conceptions permeated the debates at the end of the 19th century, studies based on this qualitative methodology were sparse until the mid-20th century, and in the area of education it was only in the 1960s that they began to appear. According to Bogdan & Biklen (1994), the delay in research with this approach is due to the strong experimentalist tendency dominated by Psychology. In the following decade (in the 1970s), studies and research with a qualitative approach flourished mainly in the United States and England.

In the 1980s, this approach became popular in Brazilian research in the field of education in the search for translating and expressing the meanings of social phenomena. Nowadays, qualitative research has been used in association with various interpretive techniques that study phenomena related to human beings and their intricate social relationships with the intention of describing and decoding the components of a complex system of meanings that promote the reduction of the distance between theory and practice.

According to Bogdan & Biklen (1994, p. 67), in qualitative research, “the main objective of the researcher is to build knowledge and not give an opinion about a given context”. As the authors argue, the expression “qualitative research” is a generic term used to refer to a set of research strategies that have common characteristics such as the ability to “generate theory, description or understanding” (BOGDAN & BIKLEN, 1994, p. 67) that is, it seeks to understand the process through which the interviewed participants construct meanings on the topic to be investigated.

Gatti and André (2011) highlight four important points of qualitative research that characterize a “new connotation”:

i) A deeper understanding of the processes that produce school failure, one of the major problems in Brazilian Education, which is now being studied from different angles and with multiple approaches; ii) Understanding of educational issues linked to social and socio-cognitive prejudices of different natures; iii) Discussion on diversity and equity; and iv) Emphasis on the importance of school and community environments. (GATTI & ANDRÉ, 2011, p. 34).
It should be noted that the option for a qualitative methodological approach in the field of research in Mathematics Education is justified by the fact that this tendency

[...] answers to very particular questions. [...] works with a universe of meanings, motives, aspirations, beliefs, values and attitudes, which corresponds to a deeper space of relationships, processes and phenomena that cannot be reduced to the operationalization of variables (MINAYO, 1996, pp. 21-22).

In light of the foregoing, it can be said that the movement of reviewing historical moments of qualitative research in the context of Brazilian education helps to reveal the construction of knowledge in the dynamics of understanding humanization processes in school institutions.

In this perspective, Bogdan & Biklen (1994, p. 47-50) present five characteristics of qualitative research, presented here in a schematic way: 1) the direct source of data collection is the natural environment where the phenomena occur, constituting the researcher the main instrument. “Qualitative researchers attend study sites because they care about context.” (BOGDAN & BIKLEN, 1994, p. 48). The authors argue that actions are better understood when they are observed in the very environment in which they occur. 2) Qualitative research is descriptive because “the data collected are in the form of words or images and not numbers” (BOGDAN & BIKLEN, 1994, p. 48). This data includes interview transcripts, field notes, photographs, videos, personal documents, memos or other records. (BOGDAN & BIKLEN, 1994, p. 48). 3) Qualitative researchers are more interested in the process than simply the results or products. (BOGDAN & BIKLEN, 1994, p. 49). The researcher's interest is to verify how a problem manifests itself in some situations. 4) Qualitative researchers tend to analyze data (rather than assumptions) inductively. “They do not collect data or evidence with the aim of confirming and informing previously constructed hypotheses, instead, abstractions are constructed as the particular data that were collected come together” (BOGDAN & BIKLEN, 1994, p. 50). 5) Meaning is vitally important in the qualitative approach. "Researchers using this approach are interested in how different people make sense of their lives." (BOGDAN & BIKLEN, 1994, p. 50).

In this chapter, we consider relevant the potential of the mentioned approach both in investigations on initial and continuing education of teachers in which the problematization of the practice itself is configured as one of the constitutive elements of a conscious teaching action.

the qualitative approach, Bogdan & Biklen (1994) argue, based on Psathas (1973, p. 51) that the role of the researcher in this approach is to question the research subjects in order to perceive “what they experience, the ways in which they interpret their experiences and the way in which they themselves structure the social world in which they live”. (PSATHAS, 1973 apud BOGDAN & BIKLEN, 1994, p. 51, emphasis added).
The investigations and actions based on a qualitative perspective can bring contributions both to the training and to the teaching practice, especially when the teacher problematizes and investigates his/her practical proposal. In the field of didactics, this process was discussed by Martins (2002; 2003).

In this scenario, studies on the daily life of the school seem to play an important role. Such studies can be related both to the possibility of reflection on the teacher's own practice, and to research with a qualitative approach aimed at understanding aspects of the school's daily life.

André (2002), when discussing ethnographic studies in the educational field, argues that the dimension of the institutional climate acts in the mediation between social praxis and what happens at school. It should be noted that one of the burning issues in teacher education is the articulation between theory and practice. According to the aforementioned author:

School praxis is determined by broader social praxis through pressures and forces arising from educational policy, from top-down curricular guidelines, from parents' demands, which interfere with school dynamics and confront the entire social movement of the inside the institution. The school results, therefore, from this clash of various social forces. (ANDRÉ, 2002, p. 40).

The author also mentions two other dimensions: the interaction in the classroom, which involves the teacher and students relationship, but is influenced by the school dynamics and the social dimension, and also the history of each subject that manifests itself daily at school through the forms of social representation through which it guides its actions. In this process, the author highlights the dimension of the individual's subjectivity. These three dimensions, according to André (2002), make it possible to understand the social relationships expressed in everyday school life, in a dialectical man-society approach in the different moments of this relationship.

As has been discussed, qualitative research is focused on phenomena - what is shown, what is manifested - and not on facts characterized by events, occurrences and objective realities.

The advances that have taken place in the scientific production of qualitative research are configured in different ways both in terms of theoretical foundations and in methodological references about the applicability of technical procedures to investigate the object in the various academic areas in Education, revealing qualitative methods and links established with subjects and investigated problems.

In qualitative research, methodological rigor is not synonymous with neutrality, even if it preserves a thorough congruence with the theoretical contributions and technical procedures of scientific investigation. The concept of methodological rigor alerts us to André (2013, p. 96): “it is not measured by the naming of the type of research, but by the clear and detailed description of the path followed by the researcher to achieve the objectives and by the justification of the options made in this path ”.

In the scenario of the qualitative approach, the methodological rigor of the research is established by the explanation of the steps followed in carrying it out, that is, the clear and detailed description of the path taken to achieve the objectives, with the justification of each option made in this path. This explanation, in addition to revealing the concern with the scientific rigor of the work (whether or not the necessary
precautions were taken in the choice of subjects, in the procedures of data collection and analysis, in the elaboration and validation of the instruments and in the treatment of the data), it also reveals the ethics of the researcher, who, when exposing their points of view, gives the reader the opportunity to judge their attitudes and values.

Lüdke and André (2013) guide that the choice of methodology is determined by the nature of the problem. Thus, for the complex reality that characterizes the school to be studied with scientific rigor, subsidies must be sought in the qualitative approach of research, since this type of investigation and its ability to understand school-related phenomena offers essential tools for interpretation. of educational issues.

According to Minayo (1996, p. 239):

Neither [approaches], however, is good in the sense of being enough to fully understand this reality. A good method will always be the one that allows a correct construction of the data, help to reflect on the dynamics of the theory. Therefore, in addition to appropriate to the object of investigation and to offer theoretical elements for analysis, the method has to be operationally feasible.

It is up to the researcher, therefore, the continuous effort to overcome this controversy and rescue a dialectical vision between these two traditions of social research.

The following section is intended to explain qualitative investigations aimed at teacher training and the professional development of teachers, relevant topics among those considered essential in issues related to the school context.

3 LINKS ESTABLISHED BETWEEN TEACHER TRAINING AND TEACHER PROFESSIONAL DEVELOPMENT

The educational action necessarily becomes a social praxis and, in this sense, it is necessary to understand the constitutive nexuses of this reality and, for these reasons, the qualitative approach research stands out with its subjective character in relation to the object of analysis.

Teacher training has become a strategic element. However, it is necessary to problematize the different conceptions of training, especially that of continuing education, because, as Souza (2006) recalls, the argument of teacher incompetence ends up supporting reductionist conceptions and practices of continuing education.

The aforementioned author brings some reflections about the ethnographic approach in education based on the studies of Patto (2015) who carried out a comprehensive literature review to problematize the issue of teacher training.

Souza (2006), based on an analysis of the literature and the reality of São Paulo, identifies the improvement of the quality of education as the founding argument of the propositions about continuing education. The author problematizes the unfolding of the work of Guiomar Namo de Mello published in the 1980s based on two categories: technical competence and political commitment. According to Souza
(2006), Mello, even if unintentionally, contributed to the construction of a negative view of teachers, resulting in a simplistic view based on teacher incompetence, being part of a "hegemonic academic discourse and educational policies " (SOUZA, 2006, p. 484).

According to the author:

"[...] our analyzes indicate that recent proposals for continuing education for educators, developed by SE, have taken teachers individually and isolated from their work context, considering poorly qualified professionals who need to be better trained. Schools, their social and institutional contexts, as well as the concrete teaching conditions that each specific school offers, have not been considered as important elements that provide the fabric for the process of change that teachers are expected to go through. (SOUZA, 2006, p. 488)

It is true that ethnographic studies that seek to apprehend and understand the daily life of the school are important, mainly to subsidize the construction of public policies based on real demands, whether focused on training or teaching work. Since, based on the inseparability of training and teaching work, continuous training strategies added to the improvement of working conditions can contribute to a teaching practice towards a critical and reflective performance, enabling an improvement in the social qualification of work and teacher training, valuing the work of the teacher and also improving the social quality of the education of the student.

In this way, investigating the professional development of teachers goes far beyond the analysis of the knowledge they acquire throughout their professional teaching life. It implies considering them autonomous subjects and protagonists with desires, intentions, utopias, etc., who suffer the conditioning of the historical, cultural, political and social contexts in which they are inserted (GONZÁLEZ PÉREZ, 2015). Therefore, it is a topic that, in order to be researched, brings human relations and the questioning of the world, which involves school practices and institutional knowledge, requires questioning public policies and relating them to the time in force, with the people involved and with the researcher. That is, a matter of relationship with the world, with school practices, with institutional knowledge, with public policies, with our time, with others and with oneself.

It is also necessary to take into account the practical experiences, built over the years of work in teaching, as it is also an important factor to consider because it means recognizing teachers as producers of knowledge, as they are often excluded from this process of reflection on the practice itself.

The professional development of teachers, according to Imbernón (2011), refers to several areas in which their actions are manifested, the projects they wish to undertake and the way they plan to execute. Still, as the scholar defends, this development seeks to promote changes in the work actions of teachers, leading to professional and personal growth.

The sociocultural context strongly influences the professional development of the teacher as it is an individual and collective process that takes place in the educational institution, although it is not solely due to pedagogical development, but also involves knowledge and understanding of oneself, cognitive
Principles and Concepts for development in nowadays society: The theory and practice movement in teaching learning: Lesson Study in the graduation and professionalization of Mathematics teachers

development, theoretical development and everything that encompasses a work situation that allows or prevents the teacher from progressing in his professional life (IMBERNÓN, 2011, p. 3).

For Marcelo Garcia (2009), investing in a teaching career contributes to the growth of teachers as professionals and in their individuality, by providing an improvement in the teaching and learning process that reverberates in the improvement of educational quality.

Finally, it is important to point out that continuing education, from a perspective of professional teacher development, requires time, experimentation and maturation, aspects that are not consistent with school proposals that are decontextualized from the current reality.

Having presented some discussions about the qualitative approach in research in Human and Social Sciences, in the next section, we will make some reflections about this approach in the field of Mathematics Education.

4 TEACHING LEARNING: THE CONTRIBUTIONS OF THE THEORY AND PRACTICE BINOMIAL

In this topic we present our reflections on teaching learning, that is, how the subjects learned to be teachers and understanding that teaching is surrounded by different feelings at different moments of professionalization, from the beginning of fears and groping to a period of stabilization, marked by the desire to learn and the desire to get it right in relation to the path to be followed in the exercise of consolidating the teaching career. Mizukami (2004, 2006) and Shulmam (2014) highlight the importance of teaching pedagogical knowledge that must be mobilized in the way of teaching learning.

Teacher training must be related to the practice of the teaching professional, a systematic and scientific activity, which, in a movement of constant dialogue, aims, therefore, to qualify and improve the professional development of the teacher.

We understand that teaching learning should promote moments of reflection for an awareness of pedagogical praxis vis a vis a reflective educational planning in which teacher training is considered the basis of research in the educational field. The pedagogical praxis that we defend involves the "understanding of the inseparability of theory and practice". (PIMENTA, 2011, p. 86) Thus, according to the author, "praxis is the practical human theoretical attitude of transforming nature and society". (PIMENTA, 2011, p. 86), that is, a continuous and simultaneous process between thinking and acting. Therefore, practice and theory are dependent and correspond to a unity of knowledge, as the teacher is committed to mediating reflective and constructive learning in educational formative moments.

Lee Shulman proposed in the mid-1980s a base composed of categories of teaching knowledge of different natures, but all of which are indispensable and necessary for competent professional performance. According to SHULMAN (1986, 1987), the knowledge base refers to a professional repertoire that contains categories of knowledge that underlie teachers' understanding that promote student learning. In his
investigations dating from 1996, he proposed to study teaching cases as promising tools in teacher training processes in the face of their teaching learning, using them “as lenses to think about their own work in the future”. (SHULMAN, 1996, p. 199)

Case knowledge is knowledge of specific, well-documented, and richly described events. Regardless of whether cases are reports of events or sequences of events, the knowledge they represent is what makes them cases. Cases can be examples of specific instances of practice – detailed descriptions of how an instructional event took place – complete with particular contexts, thoughts and feelings. On the other hand, they can be examples of principles, exemplifying in their details a more abstract proposition or a theoretical requirement. (SHULMAN, 1986, p. 11)

Finally, teaching cases play an important role when they are used to exchange, organize and generalize experiences, whether through discourse or professional memory.

4 TEACHER PROFESSIONAL DEVELOPMENT AS A TREND IN MATHEMATICS EDUCATION

According to Ponte (1998), the concept of Teacher Professional Development emerged in the educational literature to demarcate a differentiation with the traditional, and not continuous, process of teacher training. The idea of training is related to courses and training in which the trainer carries out an action that is assumed to be necessary and expected by the institutions for the performance of professionals.

Professional development refers to the transformation movement of teachers within a specific professional field, in this case, that of Mathematics. From this perspective, a process of becoming over time or from a formative action. André (2011), when considering studies on teacher training, cites Nóvoa (2009), Imbernón (2011) and Marcelo Garcia (2009) as authors who prefer the term development to characterize evolution and continuity, breaking with the dichotomous view of initial training and continued.

One of the aspects that stimulate the professional development of teachers is the search for a professional identity that allows teachers to define themselves and others (MARCELO GARCIA, 2009). Identity is the feeling of belonging that portrays the image of the teacher. Professional identity is characterized by the importance that teachers give to their image in the face of the profession. In this sense, the interpretation that teachers have of themselves in the context in which they live in the search for a sense of identity and belonging throughout their teaching career is relevant.

Professional development is built from entering school, as a student, and lasts a lifetime, with groping and advances. In addition to being a continuous process that extends throughout the working life, from initial training to postgraduate studies, it undergoes permanent updates and improvements in service.

The analysis of professional development is one of the methodological assumptions of a qualitative investigation that, in the conception of Lüdke and André (2013, p. 13) “implies the collection of descriptive data, obtained by the researcher's direct contact with the situation studied, emphasizes more the process rather than the product and is concerned with portraying the perspective of the participants”.
The professional training of educators, particularly mathematicians, and the way they act is intrinsically related to professional development, which is composed of knowledge, considered fundamental, but not sufficient, as it is necessary to know how to do it and to know how to manifest it in the form of knowledge or skills, professionals.

The problematized and shared practice of the mathematics teacher acquires connotations of professional development when it is configured by the partnership between university and school. Therefore, professional development needs new work systems and new learning in favor of better qualification and teaching autonomy that is only acquired through a personal, social and political construction that takes place through the interaction of different actors in the school system in a democratic process. It also depends on an educational management that is the result of a collective process of planning, organization and development of a political-pedagogical project that expresses a new paradigm for education.

In the last topic of this chapter, we bring the studies by Ponte et al (2016) that pointed out a relevant contribution to the training of Mathematics teachers by unraveling the challenges that are posed to the practice of research to understand the potential of the methodology of studies of mathematics. Lesson Study as a professional development process for teachers, which focuses on their teaching practice, assuming an eminently reflexive and collaborative.

5 LESSON STUDY AND MATHEMATICS TEACHING

“Classroom studies take place within the school environment and in them teachers play a central role” (PONTE et al., 2016, p. 869).

Preparing teachers to teach Mathematics is not an easy task and the experiences of countries that use the Lesson concept Study (class studies) in everyday school life is important so that we can even understand this proposal.

The Lesson Study is a process in which teachers come together to plan, observe and reflect together on the technique used in the classroom and the lesson plans they have developed in order to improve student performance. The Lesson Study is centered on two pillars: professional development and student protagonism. Therefore, it is an interesting perspective because not only students, teachers also learn.

It is a strategy that engages students so that they are active in their learning and are aware that the process of acquiring knowledge is collaborative, as it is also an opportunity for teachers to learn when they study the teaching process.

Another relevant aspect of Lesson Study is the opportunity to discuss ways of professional development, from how to work as a team to learn to teach Mathematics. The Lesson Study originated in Japan and is understood as a training process in which teachers learn in practice and have the opportunity to reflect, analyze, discuss and plan their classes, focusing on student learning. The main characteristics are
reflection and collaboration, processes that lead teachers to analyze their practices, through work among peers.

In this topic, we bring a discussion about Lesson Study in Mathematics Teaching with the assumption that it is a methodological proposal that can be adapted to the Brazilian reality, based on experiences carried out in other countries.

The training of teachers who teach Mathematics using the Lesson methodology study it is enhanced by elements that we consider essential, such as: i) the constitution and consolidation of collaborative groups; ii) research into the practice itself; iii) individual and collective reflection of didactic actions; and iv) the appropriation and use of curricular guidelines.

A fundamental aspect of classroom studies is that they focus on student learning and not on the work of teachers, which makes a direct distinction with other training processes, involving observation of classes, but which are primarily focused on the performance of teachers. In this way, the participation of teachers in class studies conducive to collaborative environments promotes learning “of important issues in relation to the content they teach, the curricular guidelines, the reasoning processes and the difficulties of the students and the classroom dynamics” (PONTE et al, 2016, p. 870).

Therefore, class studies consolidate training processes strongly linked to teaching practice, enabling theoretical deepening in several domains - mathematics, didactics, curricular, educational and organizational.

5 BY WAY OF CONCLUSION

From this bibliographic study based on different sources that address reflections on methodological issues of qualitative research, it is shown that Brazilian educational thought was historically permeated by epistemological and methodological thematic convergences and divergences.

Academic research with a qualitative approach is carried out when the study objective is to understand the reason for certain events, phenomena, behaviors or trends.

The use of the qualitative method generated several contributions to the dynamics and structure of the educational process by reconfiguring the understanding of learning and of internal and external relationships in educational instances, with a flexible qualitative approach without departing from methodological rigor. This demonstrates the existing complexity when researching the social, given that it is necessary to know how to adapt to the context and then extract relevant analyses. For this reason, its foundation is supported by interpretation (hermeneutics) that seeks to understand the meanings of what human beings live, feel, etc.

The reflection carried out throughout this text allowed us to carry out a historical reconstruction of academic research with a qualitative approach to glimpse perspectives of a praxis of conscious investigation through the articulation of teaching knowledge with teaching, research and extension activities.
The debate instituted encourages researchers to face the challenges established by the new educational conditions experienced in contemporary society due to the pandemic of the new Coronavirus. The repercussions in the coming years, post-pandemic, will demand deep questions and responsible actions, with anthropological, philosophical and sanitary references different from the status of the educational tradition.

Presenting the historical characteristics of the qualitative methodology of research in education, its theoretical concepts and main researchers that contribute with reflections in this area can support the establishment of an analytical scientific process of social relations, especially with regard to the role of the math educator.

CHAPTER 102

Incidence of Smartphones in the development of brain plasticity in children from 0 to 6 years old, in a context of high vulnerability

Jose Manuel Salum Tome
Ph.D
Doctor in Education

Miguel Angel Ponce Lopez
Klgo
Degree in Kinesiology

ABSTRACT
The research project presented below essentially aims at a systematic review regarding the use of Smartphones in the development of brain plasticity in children aged between 0 and 6 years.

Keywords: Smartphone, brain plasticity, development, behavioral skills.

1 INTRODUCTION

The research project presented below essentially aims at a systematic review regarding the use of Smartphones in the development of brain plasticity in children aged between 0 and 6 years.

This review will be composed of three large categories of content: Intellectual, Attitudinal and Behavioral, each of which is made up of a certain number of Skills, which will be expressed according to the different systematic reviews, including gray literature, which will provide the basis and theoretical and practical foundations that would allow the deduction of new research.

Once the review of literature and different studies in relation to the aforementioned have been exposed, objectify that the dependence and misuse of Smartphones in children have a negative impact on brain neuroplasticity, which ultimately is the product of the above that is expressed in misbehavior, low self-esteem, low cognitive level as appropriate to their age and associated skills.

From the results of this quantitative and qualitative (mixed) analysis, we will be able to classify the level of efficient performance of the children according to their age.

As there are no studies of a meta-analysis nature that would allow us to reflect a more advanced search with a higher degree of evidence, the current one is limited to carrying out a systematic review study.

This research process facilitates and elucidates the myths of parents that the use of the Smartphone in their children "makes them more intellectual".

It is clear that technological development advances day by day, with a greater part of the population having access to these technological means, without measuring the consequences of the neuronal brake that occurs in children under 6 years of age in the use of cell phones.
Smartphone indiscriminately and discriminately without perceiving the noxa in children, from a socioeconomic context of high vulnerability.

2 PROBLEM FORMULATION

In recent years, the entry of these devices into the Chilean market has grown constantly, whether at home or at school, generating notable changes in people's behavior, thus changing lifestyles or attitudes, for this reason. This is why it is important to understand and dimension the true effect that this technological movement has generated. Smartphones influence people's lifestyles by changing their already pre-established habits, facilitating communication and information in an agile and practical way. In this way, a technological dependency has been created, transforming traditional channels into more diversified communication channels.

A mixed quantitative and qualitative research will be carried out that will help us to have a clearer understanding of the influence that Smartphones have on users, in a more real and truthful way.

The misuse of Smartphones both at home and in kindergartens and first level education in Chile, has helped to curb brain plasticity in children from 0 to 6 years of age, a situation that occurs in highly vulnerable sectors.

The proposal presented in this research project is an evaluation of a formative nature that is aimed at improving the quality of education of young people from a vulnerable social context.

The arrival of smartphones in our daily lives has certainly changed our lives, it has certainly changed our neural development.

The brain is not an inert and fixed matter, but it is a true central unit of the human being. It is highly plastic, neural connections are developing every day and brain stimulation triggers the creation of new neural circuits.

This stimulation allows the traditional learning process and this has allowed human beings to adapt and evolve. Digital tools being powerful stimulators, they participate, like other elements, in the modification of our brain.

By 2018, estimates predict that a third of the world's population will own a smartphone. This represents at least 2.6 million users worldwide. And for many, the mobile phone has become an indispensable everyday object. To communicate, exchange with others, but also to follow the news or even have fun. On average, users spend at least 4.7 hours a day on their smartphones.

3 THEORETICAL FRAMEWORK

The World Health Organization (1982) defines the term neuroplasticity as the ability of cells of the nervous system to regenerate anatomically and functionally, after being subjected to environmental or developmental pathological influences, including trauma and disease.
Other authors indicate that neuroplasticity is the potentiality of the nervous system to modify itself to form nerve connections in response to new information, sensory stimulation, development, dysfunction or damage. In general, neuroplasticity is usually associated with learning that takes place in childhood, but its definitions go further and have a historical background. There are various biochemical and physiological components behind a neuroplasticity process and this leads to different chemical, genomic and proteomic biomolecular reactions that require intra and extra neuronal actions to generate a neuronal response.

The nervous system has extraordinary properties with the capacity for dynamic modification, a "never finished product" resulting from the interaction between genetic and environmental factors. Neuroplasticity comprises all the properties of the brain related to the constant modifications of its structure and is applied to a large number of phenomena such as neurogenesis in adults, the reorganization of cortical maps or synaptic changes associated with memory and habits. For a change to be a manifestation of functional plasticity, it must express an active process of readaptation to the requirements of the environment. At the same time the active processes must involve changes in one of these mechanisms: number of synapses, efficiency of synapses, and intrinsic neuronal characteristics.

There are cellular and molecular mechanisms of neuroplasticity phenomena, which are organized around growth plasticity: axonal regeneration, collateralization, synaptogenesis, neurogenesis and functional plasticity that indicates changes in the efficiency of synaptic transmission.

**Scientists from the University of Zurich (Switzerland) and Freiburg (Germany)**

In a study published in the journal Current Biology in December 2014, given the recent obsession with smartphones, decided to explore the plasticity of the brain in everyday situations and analyze how the use of the fingers in handling cell phones with a touch screen shapes it, producing greater brain activity.

![Percentage of left-handed, right-handed, and ambidextrous people](image)

Each region of the body has a specific area in the emotional center of the brain, where its information is processed, which is flexible and can change.

The researchers studied the activation of the sensory-motor cortex, which is activated by the movement of the fingers. To do this, they performed electroencephalograms that measured the activity of the cortical regions of the brain in 37 right-handed people, 26 of whom were smartphone users with a touch screen and 11 cell phones with traditional keyboards.

Thanks to the electroencephalogram, they recorded the brain response when smartphone users touched the screen with their thumb, index and middle fingers in order to then compare it with that of people who are still using the old phones with traditional keyboards.
The results suggest that repetitive movements on the surface of touch screens reorganize the sensory processing of the hand, with daily updates of the brain representations of the tips of the fingers.

The scientists concluded that electrical activity in the brains of smartphone users was increased by touching the tips of the thumb, index and middle fingers.

They also revealed that the use of touch screens changes the way the thumbs and the brain work together and that the amount of cerebral cortex activity associated with the thumb and index finger was directly proportional to the amount of time the thumb was used. The sensory processing of the cortex in our brain is continually reshaped by personal digital technology. The use of Smartphones is the ideal tool to study the daily plasticity of the human brain.

Below we present studies in which reference is made to the beginnings of neuroplasticity, which is associated with behavioral changes and then details studies of which we have systematically reviewed, integrating some concepts such as: neuroplasticity, academic performance associated with the use of the Smartphone.

The first experimental evidence that neuroplasticity depends on experience comes from the work of Rosenzweig and Bennet in the 1960s. These authors observed rats raised in enriched environments and found that they developed a thicker cerebral cortex, with more synaptic contacts and a greater number of both dendrites and dendritic spines.
Erismann and Ivo Kohler conducted an experiment in which they established the association between plasticity and behavioral changes. In subjects exposed to lenses that invert the visual fields (seeing everything upside down), after days of effort and confusion, they manage to function relatively normally both to dress, eat or walk, as well as to ski or ride a bike, and these behavioral changes are matched to transformations in the motor cortex and posterior parietal cortex.

**The mere presence of your smartphone reduces brain power, study shows**

**Date:** June 23, 2017  
**Source:** University of Texas at Austin (UT Austin)

**Background:** Your cognitive ability is significantly reduced when your smartphone is within your reach, even if it is turned off. That’s the takeaway finding of a new study from the McCombs School of Business at the University of Texas at Austin.

**Objective:** to evaluate if the cell phone being within reach, even turned off, significantly reduces their cognitive capacity.

**Methods:** McCombs Assistant Professor Adrian Ward and his co-authors conducted experiments with nearly 800 smartphone users in an attempt to measure, for the first time, how well people can complete tasks when their smartphones are nearby, even when they’re not using them. In East experiment the researchers asked the study participants to sit in front of a computer and perform a series of tests that required concentration total for can score right. The tests I know designed for to size the available cognitive capacity of the participants, that is, the brain’s ability to retain and process data at any given time. Before starting, participants were randomly instructed to place their smartphones face down on the desk, in their pocket or personal bag, or in another room. All participants were instructed to silence their phones.

**Bottom Line:** The researchers found that participants with their phones in another room significantly outperformed those with their phones on the desk, and also slightly outperformed participants with their phones in a pocket or purse. These findings suggest that the mere presence of a smartphone reduces available cognitive capacity, and impairs cognitive functioning, even though people feel that they are giving their full attention and focus to the task at hand. Hands.
Background: Students perform less well on end-of-quarter exams if they are allowed access to an electronic device, such as a phone or tablet, for non-academic purposes at lectures, a new study.

Objective: Researchers at Rutgers University in the US conducted an experiment in class to test whether to divide attention between electronic devices and the teacher during class affected students’ performance on in-class tests and an end-of-class exam. Trimester.

Methods: 118 cognitive psychology students from Rutgers University participated in the experiment during one period of their course. Laptops, phones and tablets were banned from half the classes and allowed the other half. When the devices were allowed, students were asked to record whether they had used the devices for non-academic purposes during the conference.

Conclusion: The study found that having a device did not lower students’ scores on comprehension tests within lectures, but lower scores on the end-of-term exam by at least 5% or half a grade. This finding shows for the first time that the main effect of divided attention in the classroom is long-term, less purposeful retention of a later recalled study task. Also when they were allowed to use devices electronics in class performance was also worse for students who did not use devices, as well as for those who did.

Is Technology Producing A Decline In Critical Thinking And Analysis?

Background: As technology has played a larger role in our lives, our skills in critical thinking and analysis have diminished, while our visual abilities have improved, according to psychological research.

Methods: Students have changed as a result of their exposure to technology, says Greenfield, who analyzed more than 50 studies on learning and technology, including research on multitasking and the use of computers, the Internet and video games.

Bottom line: Reading for pleasure, which has declined among young people in recent decades, enhances thinking and engages the imagination in a way that visual media like video games or television don’t, Greenfield said. No medium is good for everything, if we want to develop a variety of skills, we need a balanced diet of media. Each medium has costs and benefits in terms of what skills each one develops. By using more visual media, students will process information better, however, most visual media are
measured in real time that do not allow time for reflection, analysis or imagination, those that do not develop with real time media such as television or video games. Technology is not a panacea in education, because of the skills that are being lost. Students show that reading develops imagination, induction, reflection, and critical thinking, as well as vocabulary. Greenfield.

**Relationship among smartphone usage, addiction, academic performance and the moderating role of gender: A study of higher education students in India**  
Author links open overlay panel Jogendra Kumar Nayak

**Background:** Smartphones have penetrated people's lives at a faster rate in recent times in India. They are used for various purposes apart from talking and messaging such as live chatting, searching for information, mobile banking and entertainment, etc. Smartphone discussions have taken over personal discussions and one-on-one interactions between people. Usage has become so high that it has turned into addiction in many cases.

**Objective:** In this study, smartphone addiction was measured on students' academic performance, and the effect of gender and relationship status on smartphone use and addiction was also checked. Smartphone usage was measured with the help of the amount of time spent on the phone and the monthly bill.

**Methods:** A questionnaire was developed and administered to 429 higher education students in India to verify addiction, effect on performance and use of smartphones, along with the main uses of a smartphone and the demographic profile of the respondents.

**Conclusion:** The results show that the use is more in the case of women than male students. However, the effect on performance is severe for male students. Aside from behavioral changes, female students were found to have hardly any effect on smartphone addiction, unlike male students who were found to neglect work, they felt anxious and lost control of themselves. However, the effect on performance is severe for male students.

**Cellphone addiction harming academic performance is 'an increasingly realistic possibility'**  
Date: August 28, 2014  
Source: Baylor University

**Background:** Female college students spend an average of 10 hours a day on their cell phones, while male college students spend almost eight hours, according to a study on cell phone activity. "As cell phone features increase, addictions to this seemingly indispensable piece of technology become an increasingly realistic possibility," the researchers noted.
**Objective:** The study notes that about 60 percent of college students admit they may be addicted to their cellphone, with some indicating that they become agitated when it's not in sight, said Roberts, lead author of the article "The Invisible Addiction: Cellphone Activities and Addiction". Among male and female college students.

**Methods:** The study, based on an online survey of 164 college students, examined 24 cell phone activities and found that time spent on 11 of those activities differed significantly between the sexes. Some features, including Pinterest and Instagram, are significantly associated with mobile phone addiction.

**Conclusion:** Of the main activities, respondents reported that they spent the most time texting (an average of 94.6 minutes a day), then emailing (48.5 minutes), checking Facebook (38.6 minutes), surfing the Internet (34.4 minutes) and listening to their iPods (26.9 minutes).

Men send the same number of emails but spend less time on each one. "That may suggest they are sending shorter, more utilitarian messages than their female counterparts," Roberts.

Women spend more time on their cell phones. While that finding runs counter to the traditional view that men are more engaged with technology, "women may be more inclined to use cell phones for social reasons like texting or emailing to build relationships and have conversations." deeper. Excessive or obsessive cell phone use can also cause conflict inside and outside the classroom: with teachers, employers, and families. And "some people use a cell phone to get out of an awkward situation. They can pretend to pick up, send a text message or check their phones," Roberts.

**4 CONCLUSIONS**

Based on the present study and systematic bibliographic review, as well as gray literature texts, they allow us to demonstrate and objectify that the dependence and misuse of Smartphones in children have a negative impact on brain neuroplasticity, which ultimately is a product of the above that is expressed in misbehavior, low self-esteem, low cognitive level as appropriate to their age and associated skills.

As we also demonstrated in our review, we indicate that the excessive use of Smartphones closely affects the development of neuronal plasticity in children from 0 to 6 years of age, where according to neurodevelopmental anatomy-physiology studies indicate that it is the period where the greatest number of modifications in the shape of the cerebral turns and grooves are presented, which are translated in last terms in an intellectual, attitudinal and behavioral way.

The study also states that those who use smartphones are people classified as "intuitive thinkers", that is, they trust their instincts when making a decision. However, for scientists, people with higher intelligence are those who are more analytical and less intuitive. They consider that since the history of humanity, people tend to avoid spending energy to solve a problem and "everything seems to indicate that it seems likely that people will use their smartphones more and more."
Finally, the present study leaves open the possibility of mixed observational and/or experimental research.

ABSTRACT

The degradation of the environment, currently, is constant and can be observed all around the world. Although nature is essential to human survival, concern for its preservation has been put aside. However, the destruction of the environment puts at risk the future of human beings and, taking knowledge from that, teachings turned The awareness of this issue become increasingly important. With that in mind, the gift study had as objective to introduce one analysis about The importance of teaching gives environmental education in schools as a way to train people who, in society, act in a critically and consciously in relation to the various environmental problems, striving to achieve preservation of quite environment. That analysis if He gave referent to the years old initials of Teaching Fundamental, period in which the child begins his motor, cognitive and social development. For such, started from a bibliographic review as a research methodology, through which it can collect necessary data for the elaboration of the study with a survey of theoretical sources. So you can conclude that the teaching of environmental education in the early years of elementary school is essential for in the future soften you impacts arising gives degradation environmental, then takes to the individuals, still at your childhood, information, knowledge and change in behavior, allowing them, still acquire more responsibility environmental, ethics and Social.

Keywords: Education environmental, Quite environment, Teaching, Years initials.

1 INTRODUCTION

In Brazil, environmental education is dealt with by Law No. 9,795, of April 27, 1999, through which the National Environmental Education Policy was instituted. Second The law (BRAZIL, 1999), The education environmental has part at education national, allowing the individual to build social values and other skills that focus on environmental conservation. In this context, teaching that, as stated in art. 2 of Law No. 9,795/99, must be present in all modalities of the educational process.

With O intention in aware at people how much The bad use From resources natural and possible problems consequents gives degradation of quiteenvironment, which jeopardize the very future of human beings, this teaching has become increasingly important, evolving as a need to rethink The relationship man/nature under another ethics (ANZILIERO, 2014).

But, as environmental education can cooperate for the awareness of human beings in relation to environmental problems, especially at a time in what in all O world grow up O number in "attacks" to quite environment? With this in mind, the present study aims to present a analysis of the importance of teaching environmental education in schools like one way in to form people criticism and aware of several problems environmental and gives need in preservation of quite environment.
Expected with that study answer questions turned at possible consequences of environmental degradation to human beings, to the way in which environmental education contributes to forming citizens who are aware of what it says respect for the preservation of this environment, and how this teaching can be applied in Brazilian schools in such a way that, from childhood, this understanding.

This research is justified by the desire to collaborate so that this scenario today visa, in undoing of quite environment, be changed through gives awareness. It is expected that, by pointing out the benefits of inclusive education environment as teaching in Brazilian schools, it is possible to form future citizens worried in to maintain preserved a patrimony responsible per to guarantee The survival of beings alive. Therefore, to achieve the intended results of the study, a literature review methodology. This consists of a survey of sources theoretical concepts, aiming to formulate the contextualization of the research, as well as your foundation theoretical (PRODANOV; FREITAS, 2013).

2 THE IMPORTANCE GIVES EDUCATION ENVIRONMENTAL

Currently, disrespect for the environment has reached levels never seen. Helen Briggs (2020), in a report by BBC News Brazil, draws attention for O fact in what The undoing gives nature fur men grow up in rhythm catastrophic. Since the year 1970, according to data presented by the journalist, a drop of about 68% can be observed in 20 thousand populations of the most different species of animals, including birds, mammals, amphibians, fish and reptiles, in consequence of damage caused The nature for the human activity.

As explained by Alves (2016), deforestation of forests, pollution of rivers and seas, the release of polluting gases into the atmosphere, are among the main and more common human activities that take the environment to its wear. AND although The Law no. 9,795/99, what treats The question gives education environmental, aim at reduction of such destruction and the preservation of the environment, this is an act what no has been easily Reached.

To deal with That question, The Law lays down:

Art. 1° Environmental Education is understood as the processes through the which O individual and The collectivity build values social, knowledge, skills, attitudes and Skills turned for The conservation of the environment, a good for common use by the people, essential to the healthy quality in life and your sustainability. (BRAZIL, 1999)

Despite in your great importance, The education environmental still It is unknown to many citizens, communities and civil societies, even to operators of Right, as point Thomas et al. (2017). That if from the, mainly due to the absence of your teaching in public schools and deprived of country, be at the teaching fundamental or teaching medium.
O teaching gives education environmental has as goals fundamental:

Art. 5th: I - O development in an integrated understanding of quite environment in its multiple and complex relationships, involving aspects ecological, psychological, legal, political, social, economic, scientific, cultural and ethical;
II - The Warranty in democratization of the information environmental;
III - O stimulus and O fortification in one conscience criticism about The environmental problem and Social;
IV - O incentive The participation individual and collective, permanent and responsible, in preservation of middle balance environment, understanding if the defense of environmental quality as a value inseparable from the exercise gives citizenship;
V - encouraging cooperation between the different regions of the country, at micro and macro-regional, with views The construction in one society environmentally balanced, founded on the principles of freedom, equality, solidarity, democracy, justice Social, responsibility and sustainability;
VI - O promotion and O fortification gives integration with The science and The technology;
VII - O fortification gives citizenship, self determination From peoples and solidarity as foundations for the future of humanity. (BRAZIL, 1999)

It is understood, so, what The education environmental It consists in a branch gives education what has O objective in Disseminate knowledge about O quite environment to then cooperate with the preservation and conservation of the environment, and, even the possibility of sustainable use of natural resources for avoid further destruction of this.

2.1 O QUITE ENVIRONMENT AND YOUR RELEVANCE TO THE HUMAN SURVIVAL

Wars and conflicts, well as at many evolutions technological, no provoke changes only at society, O quite environment It is constantly harmed on account of these. Faced with these questions, it has become increasingly clear the need to preserve an environment that has been constantly destroyed (THOMAS, et al., 2017).

In this way, Conferences, Declarations, Recommendations and Laws began to be established in the search for the preservation of nature. According to Thomas et al. (2017), still in 1972, the Stockholm Conference was held, the first history to debate issues related to the environment. This one had the participation of specialized United Nations units and agencies united (UN), 113 States and 250 organizations no governmental (NGOs).

Of this Conference he was approved The Declaration about O Quite Environment Humanity, also known as the Stockholm Declaration, which is considered a historical landmark for Environmental Education, because, according to Pedrini (2000), has become an essential instrument in solving the international environmental crisis. Such Declaration had the participation and approval of Brazil.

From the Stockholm Conference, the Action Plan was also produced for O Quite Environment Human, per quite of which were established 109 recommendations for deal with at measurements international for support at actions in assessment and management, environmental management activities and the overall program of evaluation environment (PEDRINI, 2000).
Currently, support for the environment is increasingly important noticeable. That if from the, second saints, kings and Tavares (2012), why:

The planet is experiencing a period of constant transformations in what refers to environment [...]. All the media exposes their attentions for The action of human beings with nature, in the face of forest fires, logging, about The inequality Social, From assets produced, gives social justice, equality, rights and food, among others. The landscape Natural historically he comes if modifying with at interventions of human beings, ceasing to be a natural landscape and becoming a be a transformed landscape... (SANTOS; REIS; TAVARES, 2012, p. 133)

In this way, Environmental Education began to be presented as a human need and right to an ecologically balanced development, as well as an indispensable instrument for human life with dignity, whether generations of the time or to future generations, based on the understanding that only through education the human being would be able to become aware of the quite environment and questions environmental issues (PIOVESAN, 2015).

At the moment, It is each turn most crisp what you scratchs environmental they are directly related to human behavior. For the most part, they from the unpredictable effects of globalization. The fact is that the progress generated by the constant development so much of Science how much gives technology has if shown, second spider and Klebis (2013), as one source potential in self destruction gives society industrial. Still, The leave of these, new scratchs in character global are produced, O what no only affect O planet and your quite environment, but also through borders nationals and in classes social.

Soon, considering what at questions environmental they are each turn most gifts at the daily gives society, introducing themselves as one question what needs to be worked with all the people who are part of this society (MEDEIROS, et al., 2011), the application of environmental education as a teaching in Brazilian schools can help a lot so that, in the future, more critical citizens and aware of these issues take part in facing the problems environmental.

3 ENVIRONMENTAL EDUCATION IN THE EARLY YEARS OF EDUCATION ESSENTIAL

The initial years of Elementary School in Brazil, consisting of the 1st to 5th year, involve The literacy and O development motor, cognitive and Social of children, per quite, mainly, in activities playful, or be, games and games that help practical teaching. In this way, the child learns not to by theory, but by action, executing movements that amuse you, movements recreational (ARRIADA, et al., 2013).

According to Marques (2017), recreational activities have promoted a better and most impactful learning in children during the early years of school Fundamental. Per quite of these they they can to explore most your creativity and strengthen your side emotional, well as your conduct at the process in teaching-learning. That occurs why, being, these activities, one tool pedagogical with The ability to awaken the imagination of child in a way significantly, greatly contribute to the cognitive development that stimulates the relations interpersonal.
Secondly Brougère (2008, apud ARRIADA, etc al., 2013, p. 75-76):

This playful culture is not closed around itself, it integrates external elements that influence play: attitudes and abilities, culture and social environment. Toys are part of this context. [...] new play structures, or the development of some to the detriment of in others, new representations: O toy contributes for O development of play culture. (BROUGÈRE, 2008, apud ARRIADA, et al. al., p. 75-76)

With the use of games, various games and toys, the child catch up one representation in environments and objects external in your learning, enlarging your imagination and, so, your knowledge (ARRIADA, et al., 2013).

From this understanding, it can be considered that a new teaching, when applied to children in the early years through playful activities, it can have a greater effect on these children than on older children or even on older children, people adults. That he can to take to consensus in what O teaching gives education environment in the early years of Elementary School can cause greater commotion than that the same education in the final years of Elementary School, High School or Teaching Higher.

According to Medeiros et al. (2011, p. 2), “environmental education is a process fur which O teaching begins The get knowledge about of questions environmental”. At this stage, a new vision of the environment is inserted in the student. environment, at search per become clear The need gives preservation and conservation of quite environment.

Badr (2011, apud THOMAS, et al., 2017, p. 22) places teaching as a "streaming in knowledge, in information or clarification Useful or indispensable The education". How much The education, it's about of Name given away to process in teaching what prepare a individual for O exercise gives citizenship, enabling him to work and socialize. This education is from the transmission of a set of necessary knowledge, so that be likely to contribute effectively as development full in one person.

In this way, taking environmental education as a teaching is to place it as a essential, indispensable, useful The society, useful The formation and development in each person, in a way what be likely to best contribute for with O quite environment.

3.1 O TEACHING GIVES EDUCATION ENVIRONMENTAL IN THE SCHOOLS BRAZILIAN

Saints, kings and Tavares (2012) point what, being one institution responsible for the formation From citizens, The school has O to owe Social in develop a system of knowledge, skills and values that underpin a rational behavior also on the environment, as it is present in the life in all at people, want they or not. For you authors, practice The education environmental It is essential for The understanding From dilemmas existing currently in relationship the questions environmental.

In this context, there must be an interconnection between School Education and the Education Environmental. In addition of teaching already past in the schools, in wake up with Medeiros et al. (2011),
teachers should also strive to find the improvement of the planet and for better environmental conditions through Education Environmental.

Considering that environmental issues are increasingly present in the society and need to be worked on in the midst of it, it is understood that one of the best ways to work with them is in schools, where, even as children, people are educated and taught about various topics of relevance to society (MEDEIROS, et al., 2011).

Environmental education in schools contributes to the formation of citizens conscious, fit for decide and act at reality socio-environmental in a way that is committed to life, to the well-being of each one and the society. For that, it is important what, most of what information and concepts, the school is willing to work with attitudes, with the formation of values and with more practical than theoretical actions so that the student can learn The love, to respect and practice actions turned The conservation environmental. (MEDEIROS, et al., 2011, P. 2-3)

As the importance of this teaching in Brazilian schools becomes clear, new educational proposals, as well as new worldviews, have emerged in the insertion gives education environmental in schools in Teaching Fundamental at the Brazil (SOUSA, 2018). One search of Institute National in Studies and Researches Educational Anisio teixeira (INEP), still at the year in 2004, already pointed a increase in teaching gives education environmental in these schools.

The search of INEP demonstrated what, in 2004, the state of amazon had an index of 92.5% of elementary schools that included the education environmental in their resumes. At the Midwest, 73.2% from educational establishments had already adopted this policy. The state of Sao Paulo had 65.9% of schools with specific programs and projects on the environment environment. The southern region of the country had 50.6% of schools that practiced teaching education environment (INEP, 2004). Currently, these rates are low. However, the importance of Implementation gives education environmental in the schools becomes each turn larger, mainly due to the considerable increase in the number of inhabitants in the planet, arriving about in 7.5 billion in people.

Vieira (2020) points out that this implementation can be done simply and basic. In addition to the practice of games and games with the theme "environment", encourage conscious consumption of water and energy in classrooms, bathrooms and school drinking fountains, teach the importance of recycling bins and make a vegetable garden collective he can to tease big ones effects at learning of children, making them, in the future, citizens aware of the need for preservation and conservation of quite environment.

4 CONCLUSION

In order to bring an analysis about the importance of teaching environmental education in Brazilian schools in the struggle to form critical citizens and aware of the many environmental problems as well as the need to preservation of the environment, the study was dedicated to presenting the concept of Education Environmental, second The Law no. 9,795/99, your importance for The society and your application like a teach us years old initials of Teaching Fundamental.
Through this study it can be observed that environmental education has your importance recognized in several documents, be nationals or international. However, the degradation to the environment, currently, shows stronger than ever before. The fact is that Conferences and Declarations to respect gives preservation of quite environment without The awareness From beings humans does not guarantee the conservation of nature, as technological advances and scientific has been placed first.

In this context, it is clear that this awareness can only be achieved through education, because education is what forms the citizen. In this way, you can understand that the emergence and development of Environmental Education as a teaching method is directly related to the environmental movement, as it is result of awareness regarding the problematic environmental.

In fact, The education environmental he comes in one need in Repair about the environment. This education brings us a new way of reading reality and how to act on it. She can change habits, transform the situation of the planet land and still provide a better quality of life for people. Although, That must be taught and practiced.

So, considering be you years old initials of Teaching fundamental, normally the period in that the child develops better cognitively, as well as in its actions, the application of the teaching of environmental education in this step can have major impacts and shape the way these children see the environment, seeing the need to protect it even for the survival human.

At this stage it is common for children to learn through activities playful, what are you games and jokes, by having in View what, these, best develop your imagination and creativity.

The application of recreational activities for children's learning in the years initials of Teaching Fundamental allows one participation practice of these with O teaching given to them. In this sense, the teaching of environmental education this stage can put the child in contact with nature even in the first years of your life, with greater chances of awakening, in this, the awareness sought by environmental education, that is, the need to preserve the environment environment.

He can complete, then, what O teaching gives education environmental us years old initial stages of Elementary School is essential to mitigate the impacts arising gives degradation environmental, then takes to the individuals, still at your childhood, information, knowledge and behavior change, allowing them, still, purchase larger responsibility environmental, ethic and social.

CHAPTER 104

Relationship between anxiety and coping styles before exams in psychology students

1 INTRODUCTION

At present, a term that is often used frequently when referring to states of mind is anxiety, with greater emphasis on those situations that by their nature can generate unpleasant states, experienced as restlessness, restlessness, among others. In the same way, this is usually mentioned and understood as a disorder or disorder that generates a global feeling of apprehension and concern (Melgosa, 2019), which all of us can experience at different times in our lives. University students, due to their multiple occupations, tend to be a population prone to being exposed to situations that can be considered of high emotional impact, such as exams.

In relation to this topic of anxiety and students, we have that the research that has been carried out has revolved around several aspects, among which we have anxiety before exams and physiological anxiety, where the first; It is defined as the tendency to respond with anxiety in situations of assessment of skills especially in how it manifests itself before the presentation of exams and how students face it, which is why we sought to identify the levels of anxiety and the Coping styles of a group of psychology students before the exams of a private university in Barranquilla, Colombia. The COPING Strategies scale was applied for coping strategies and the AMAS-C scale for test anxiety. The methodology is quantitative, with a transversal descriptive level. A stratified random sampling of psychology students from II to X semester 2020-2 was carried out, for a sample of 133 selected students. The results show that the levels of anxiety before the exams were 33% clinically significant anxiety, 33% mild anxiety, 22% total anxiety and 22% presented levels of clinically significant extreme anxiety, with respect to coping styles 100% of the sample uses the expression of coping difficulty (EAD). In conclusion, it can be shown that carrying out an activity such as exams tends to generate an emotional response in all students, in the same way, regardless of the degree of anxiety that may occur, in general, the main response of coping style will be the of expressing the difficulty towards others as a means of escape.

Keywords: Anxiety, coping styles, COPING scale, AMAS-C scale.
and knowledge, whose central aspect is concern about possible poor performance in the exam or damage to the self-esteem of students (Torrano, Ortigosa, Riquelme and López, 2017), where the subject experiences symptoms that generate attention distraction, generating negative thoughts or recurrent automatic thoughts, preventing adequate reasoning before the test, on the other hand, the second, with respect to physiological anxiety, based on conception of anxiety and the physiological component, these are invariably related to changes and physiological activation of an external type (sweating, pupillary dilation, tremor, muscle tension, facial pallor, among others), internal (acceleration of heart and respiratory rates, decrease in salivation, among others), and involuntary or partially voluntary (palpitations, tremor, vomiting, fainting yes, among others). These alterations are subjectively perceived as unpleasant and help shape the subjective state of anxiety (Labrador, 2014).

On the other hand, another aspect in relation to the research that has been developed concerns the coping styles most used by students in situations that generate anxiety. Coping styles are the personality predispositions that transcend the influence of the situational context and time, these personal predispositions are what determine the use of certain coping strategies, which are the concrete and specific processes that are used in each context, and they can be changing depending on the triggering situations (Espinoza, Guamán and Sigüenza, 2018), in the same way coping is part of the range of psychological and personal resources of the subject, involving the levels of quality of life.

At the international level, research has been found, such as one carried out in Lima, where the population of university students presented about anxiety before exams that 52.4% of the population exhibit a moderate level of anxiety and 26.5% in the level high indicating that most college students experience worrying cognitive responses before or during the exam. Likewise, regarding the physiological reactions dimension, it was observed that 49.2% of the students surveyed are at the average level, which shows that the majority of the students show responses produced in the body during the evaluation (Maldonado and Zenteno, 2018).

In the national field, an investigation carried out in Medellín was found, where the predominant levels of anxiety were analyzed, they found that 36% of the participants presented levels of anxiety in maximum degree, followed by Level 2, minimum to moderate anxiety with 28%, about half of the students have high levels of anxiety. Regarding the coping strategies variable, it was found that students tend to use problem-solving, positive reappraisal, search for social support and cognitive avoidance strategies more frequently. (Castellanos, Guarnizo and Salamanca, 2011)

At the local level we have the study carried out by Ávila, Hoyos, González & Cabrales (2011) where; the physiological manifestations were reported by 18.5% of the participants, the motor manifestations reached an identical average to the physiological ones, with 18.5% prevalence, these being the most serious expressions of anxiety in the sample, the results obtained allowed us to observe that precisely the The appearance of worries is the most frequently identified symptom among university
students (76.5%), followed in order by the appearance of fear (47%), as well as the development of negative thoughts and feelings.

All this panorama allows to show that there is a problem regarding the levels of anxiety managed and its manifestations by university students, such as the different coping strategies, for which we have set as an objective to find the relationship between anxiety and styles. coping before exams in psychology students from II to X semester.

2 METHOD

The research was framed in a quantitative approach, of a descriptive type, with a transversal scope of correlational cut.

The chosen population was all the students from (II to X) semester of the psychology program of the Metropolitan University enrolled in this program in the period 2020-2.

The following were taken into account in the selection criteria for choosing the sample:

Inclusion criteria: 1) Students over 18 to 22 years old, 2) Psychology students, 3) Students from II to X semester, 4) Psychology students who wanted to take part in the study, 5) Psychology students who do not have with a history of psychiatric illness.

The exclusion criteria were: 1) Students under 18 years of age, 2) Students from other faculties, 3) First semester students, 4) Psychology students who did not want to take part in the study, 5) Psychology students who have history of psychiatric illness.

The sample was obtained by means of a non-probabilistic sampling by conglomerate, obtaining n=133. For the exclusion criteria, the presence of a history of psychiatric illnesses and the refusal to participate in the research by not signing the informed consent were taken into account.

The variables to take into account in this characterization are fundamental, such as Anxiety and Coping Styles, these have gone through a process of analysis, supported by quantitative information in order to respond to how anxiety and coping styles are related. before the exams.

For the selection of the sample of psychology students from II to X semester, a non-probabilistic conglomerate type sampling was used, which allowed taking a significant amount of each of the semesters involved in the study, as a result obtaining a total of 133 students participating in the research.

For the evaluation of Anxiety, the Manifest Anxiety Scale for University Students (AMAS-C) was used. It is made up of 49 items, contains four anxiety scales and one of validity. The IHS (Restlessness/Hypersensitivity) subscale consists of 12 items. The SOC (Social Concerns/Stress) subscale has 7 items. The third subscale of the AMAS-C is called FIS (Physiological Anxiety), which comprises eight items that reflect the physiological manifestations of anxiety. The fourth anxiety subscale of the AMAS-C is Test Anxiety, which consists of 15 items that reflect the anxiety associated with university exams. Finally, the AMAS-C has a Lying subscale that consists of 7 items. As in the case of the AMAS-A,
the TOT score of the AMAS-C is the sum of the scores of all the subscales without including the lying subscale.

Coping Strategies Scale - Modified (EEC-M) made up of 69 items, has 12 factors which are distributed: Factor 1 problem solving, Factor 2 social support, Factor 3 waiting, Factor 4 religion, Factor 5 emotional avoidance, Factor 6 professional support, Factor 7 aggressive reaction, Factor 8 cognitive avoidance, Factor 9 positive reappraisal, Factor 10 expression of coping difficulty, Factor 11 denial and Factor 12 called autonomy, aims to identify, measure and distinguish the frequency of use of coping strategies that people assume at an individual level in the face of stressful situations that they face in life.

3 RESULTS

The analysis of results was carried out using Excel matrices, which allowed the tabulation of the information obtained from the applied instruments.

According to the results obtained, the most important sociodemographic conditions of the population corresponding to sex and age are established, where males represent 13.6% of the total sample and females represent 84.8% of the population. on the other hand, the ages range between 17-25 years.

Initially, an analysis of the results obtained through the application of the AMAS C test was carried out, from which all those related to the areas of anxiety before exams, physiological anxiety and total anxiety of students from II to X semester were taken, taking into account counts the categories (extreme, clinically significant, mild, expected and low), the averages obtained in each area per semester and the T scores that allowed us to make the proper classification taking into account the test manual (Table 1).

Finding that for the Physiological Anxiety area, taking into account the T scores, t= 45 and 54, 67% of the semesters evaluated are within the category of Expected Anxiety, 11% in the mild category t=55 and 64, and the 22% in clinically significant t=65 and 74. In Anxiety before exams, the results obtained show that 33% of the semesters that were evaluated present a clinically significant level of anxiety t= 65 and 74; another 33% showed a level of mild anxiety t= 55 and 65; and lastly, 33% had an expected level of anxiety t=45 and 54. Regarding Total Anxiety, it is possible to show that 22% of the semesters were placed in the category of Extreme Anxiety t=>75; another 22% in the level of clinically significant anxiety t=65 and 74, 22% in mild total anxiety t=55 and 64; another 22% within expected total anxiety t=45 and 54, and only 11% low total anxiety t=<44. (Table 1).

Finally, when finally making the comparison between the results obtained from the 3 areas of Anxiety (Physiological, before exams and Total) it is possible to observe that semesters II and VI are the groups with the highest T scores, thus evidencing manifestations of anxiety significantly compared to the other semesters included in the research. (Table 1)

The analysis of the most used coping strategies in psychology students from II to X semester was continued through the application of the Modified Coping Strategies Scale (EEC-M), in which, through the percentiles found, it is observed that the area with the greatest significance is that related to the expression of coping difficulty (EDA) with percentiles between 20-35, which occurs in all semesters, in the same way it is possible to show significant scores as they are for the search area of support (BS) with some percentiles of 35 in and in the positive reappraisal area with percentiles of 35, respectively. Thirdly, regarding the relationship between test anxiety and the coping styles used in psychology students from II to X semesters, we have that, at a general level, regardless of the degree of total anxiety they may present, they all use as a strategy the expression of the difficulty of coping. When performing an individualized interpretation, we found that the II, III and VI semesters present clinically significant test anxiety with high use of the coping style Expression of coping difficulty and with high average use of Positive Reappraisal. What corresponds to semesters IV, VII and VIII present an anxiety before exams of a mild type with high use of the coping style Expression of coping difficulty, and with medium use Search...
for support and Positive reappraisal. Finally, what concerns the semesters V, IX and X present anxiety before the exams of the expected type, making use of the coping style Expression of Coping Difficulty at a high level. (Table 3)

4 DISCUSSION

The results of this research show the levels of anxiety before exams reported by psychology students from II to X semester, and what are the coping strategies most used to deal with these situations and the relationship between the two variables and contrast the results obtained by other referents.

Regarding the first objective, the results show us that psychology students from the 2nd to the 10th semester present 67% of expected physiological anxiety, therefore their physiological conditions are common; 22% manifest clinically significant physiological anxiety, which suggests tense, nervous individuals; predisposed to psychosomatic illnesses and attention problems and finally 11% a physiological anxiety tense individuals, somewhat restless and that probably function well in the absence of other elevations according to the potential meaning of the score that appears stipulated in the AMAS manual. The previous results show a relationship with that described by Navas (1991) who defines "anxiety as an
emotional state, therefore there is a mixture of feelings, behaviors and reactions or physiological sensations" (as cited in Diaz & Castro, 2020, p.13), and according to (Miguel, T. 1990) by "Physiological aspects characterized by a high degree of activation of the autonomic nervous system and motor aspects that usually involve poorly adjusted and poorly adaptive behaviors" (as cited in Diaz & Castro, 2020, p.13).

Regarding test anxiety, the values obtained between the groups were uniformly distributed, 33% clinically significant anxiety related to evaluations or assessments of any kind and possibly detrimental to performance; repetitive worry about general grades and a test; 33% mild relief related to exams that probably motivates them and rarely impairs performance and finally 33% expected anxiety with normal levels of worry related to solving exams; No unusual responses are anticipated as long as there is adequate preparation, according to the potential meaning of the score that appears stipulated in the AMAS manual. According to these results, it is important to highlight what was stated by Conde (2004) who states that "students feel threatened when they are evaluated, so they may suffer from harmful anxiety." “The anxiety before the exams produces in some students can produce a series of negative emotional reactions that can inhibit the execution of the students according to their academic potential” (Onyeizogbo, 2010).

Likewise, (Ricoy and Fernández, 2013). maintains that "Students attribute a series of conflicting sensations at the time of being evaluated, although negative emotions (mainly nervousness) prevail over positive ones, before and during the development of the exams, in the same way, to account for the academic performance at the students generate an increase in anxiety, when the instructions offered by teachers are threatening to carry out a test and if there is pressure with the time available or if the task is complex.

When comparing the previous results with those obtained in Total Anxiety, we find in the latter a homogeneous distribution of data, thus being 22% of Extreme Total Anxiety, which refers to a probable alteration of thought and weakening of emotional energy, vague fears, deficiency in decision making and frequent evidence of poor judgment; probable concomitant depression; 22% clinically significant total anxiety therefore fearful, anxious individuals are found and with probability of some psychophysiological manifestations of anxiety and possible rigidity in the thought process; 22% slight total anxiety students adapted to their environments, who try to be well despite certain insecurities; 22% expected total anxiety, typical students without abnormal patterns of stress or unusual reactions and finally 11% low total anxiety in those confident and focused students or associated with narcissistic tendencies; according to the potential meaning of the score that appears stipulated in the AMAS manual.

Taking into account the results, several authors and investigations affirm that university students constitute a risk group for anxiety due to their psychological, social, academic demands and high stress, although it is true, there is a level of anxiety that is considered mild and clinically significant, when the established indices considered mild are exceeded, a deterioration in daily activities appears, causing a lower performance in their performance. According to the 2017 National Mental Health Survey in Colombia, there are multiple situations that increase the risk of mental health disorders, with anxiety being one of the most frequent in Colombia in adults aged 18 to 44, 9.6%. (95% CI: 8.8%-10.5%) have symptoms suggestive
of a mental disorder, 52.9% have one or more anxiety symptoms and 80.2% show 1 to 3 depressive symptoms.

Regarding the results obtained on coping strategies, it is found that students tend to use more frequently the one related to the expression of coping difficulty (EDA) with percentiles between 20-35, which occurs in all semesters, support seeking (BS) with a percentile of 35 in the seventh semester and in the area of positive reappraisal with percentiles of 35 in the semesters of III, IV and VI, respectively in this way. The results obtained are consistent with the study carried out by Cárdenas, Camargo & Castillo (2011) on the relationship between anxiety levels and coping strategies in psychology practitioners from a Colombian university, they are supported by the findings of the present investigation, being the problem solving strategies and search for social support the most used by students; Similarly, the study conducted by Moreno & Villegas (2008) found that problem solving and autonomy yielded scores above 63% and 56% respectively, while seeking support with 59%, cognitive avoidance 56%. and expression of coping difficulty 56%.

The expression strategy of coping difficulty, positive reappraisal and the search for support are aimed at minimizing the effects of the stressor by addressing it directly, being strategies of nature, cognitive strategies and behavioral strategies, where the expression of coping difficulty seeks know about the problem and clarify the alternatives to face the problem, the positive reappraisal seeks or is a cognitive strategy directed towards optimism to the contribution of tolerating the problem and generating thoughts that favor the problem and/or situation, and the search for support aimed at finding the professional resource for the solution of the problem, all these strategies generate efforts for the possible different types of solutions.

Regarding the relationship established between anxiety and coping styles, we found that all semesters, regardless of the level of anxiety they present before the exams, have the Expression of Coping Difficulty as their main coping style, this being a coping strategy, cognitive character where the individual seeks to know about the problem and thus clarify the various alternatives to face it, in the same way, here the individual expresses the emotions generated by the situation and/or problem. This strategy emerges as an expression of hopelessness or frustration in controlling the problem, this implies a self-assessment process, where the individual will look for other strategies on the way to help himself, such as Social or Professional Support, where he will identify the difficulties and possible solutions to the problem through non-own resources, according to the results obtained, it cannot be concluded that all semesters use this type of coping style, but it is possible to add the three most used according to the result of the applied instruments, taking into account consideration the Expression of Coping Difficulty, Positive Reassessment and the Search for Support, being the most significantly used.
5 CONCLUSION

In relation to what was previously stated in this investigation, the specific objectives set and the general objective were achieved. In the first place, the levels of anxiety present in the students from II to X semester of psychology were evaluated, taking into account the results obtained in the categories of Physiological Anxiety, Exam Anxiety and Total Anxiety, it can be highlighted that unlike the other semesters that were between the mild and expected range in both types of anxiety, II and VI showed Extreme and Clinically significant values, an aspect of marked relevance that requires further exploration, because these variations may be due to a multiplicity of factors. factors among which can be found what concerns the semester in which they are, the responsibilities that are assumed, the adaptation to the new change such as entering university life in the case of the II semester and for VI the concerns about find yourself in a semester about to start your professional practices and that demands much more responsibility, however we cannot It is concluded as such that these are the reasons for these variations between the semesters and it is necessary to continue monitoring the students in order to determine the causes or reasons that lead them to experience more anxiety in relation to the upper and lower semesters, respectively. With regard to some students, they drew attention to the scores that their tests showed, values that exceed normal traits and that make them prone to developing some type of disorder.

Secondly, the coping strategies that students use most frequently were identified and it was possible to conclude that in relation to this variable, most semesters mainly use the Expression of Coping Difficulty as Coping Style, except VII semester that uses Support Seeking, this shows the preference for the use of coping aimed at expressing the emotions generated by the situation, and solving problems, indicating that the majority of students tend to accept that situations exceed them and they must make an open expression of their emotions in order to subsequently be able to find a solution to problems by relying on others, this coping style can be described as the precursor of other coping styles.

Thirdly, the general objective was fulfilled, to establish if there was a relationship between Anxiety before exams and Coping Styles from II to X semester of psychology, concluding that regardless of the level of total Anxiety before exams that manifest the students, the coping style that occurs most is the Expression of Coping Difficulty, thus evidencing that there is a relationship between both variables, however, these results suggest the need for other research where the same is done with other professional careers and that a comparison be made and be able to conclude if the professional career has something to do with the Coping Style to be used by the students, or if not, it must be for other reasons.

The styles that most predominated in the study sample were: the "active" coping style, followed by the "turn to religion" coping style and, slightly below, "search for social support (instrumental reasons)". The least used styles were: "search for social support (emotional reasons)" and "acceptance".

Taking into account the results obtained from this investigation, some recommendations have been structured based on the results at a general level, making it necessary to continue the investigation and follow-up in relation to the semesters that presented higher levels of anxiety and coping styles.
Due to the individual results obtained by some students, which were clinically significant for test anxiety, the implementation and application of programs from institutional well-being in aspects related to study habits, study techniques (schemes, summaries and diagrams), relaxation techniques and monitoring by psychology.

ABSTRACT
The social and cultural devaluation of handicrafts demands its adaptation to a new market scenario. Their work together with design has been the strategy employed through design intervention programs. However, this process has not generated lasting results. Therefore, this research sought to build guidelines for the construction of new programs structured in a booklet. To this end, it developed an analytical-qualitative research with conversations with 100 artisans from 16 communities about the intervention programs in which they participated. As a result, the negative and positive points of the programs according to the artisans were presented. This issue involves (1) the project itself; (2) its execution; (3) content worked and (4) participants. The active participation of artisans from the design of the project to the execution of the workshops as workshop workers stands out as fundamental. They were also emphasized as important contents and workload distribution of the workshops contextualized with the community. In addition to these direct results, it was also possible to conclude some characteristics of the community that facilitate and hinder the execution and maintenance of the actions of the intervention projects, such as the presence of active leadership (natural or built) and the understanding of the need and interest in changes. As an obstacle, the financial immediacy and low self-esteem of the artisans stand out. Given this information, some guidelines can be identified.

Keywords: Primer, guidelines, Intervention, Design, Teaching.

1 INTRODUCTION

The contemporary economic context still has craft production as a strategy for the construction of objects. According to the IBGE and the Ministry of Culture through the Basic Municipal Information Survey (2014), many Brazilian municipalities still develop artisanal production. Handicrafts are part of social entrepreneurship, the creative economy and the economy of culture.

In this sense, Wanderley (2015) presents craftsmanship as both a product and a process. The same author (2015) points out 03 fundamental characteristics: (1) predominance of manual manipulation; (2) direct result of artisan energy with author identity; (3) a cultural representation.

In this context of local artisanal production, Krucken (2009, p. 17) also argues that "local products are cultural manifestations strongly related to the territory and the community that generated them. These products are the result of a network, woven over time, which involves biodiversity resources, traditional production methods, customs and also consumption habits ."

Even at this juncture, handicrafts in Brazil have been losing their social existence and cultural strength due to the lack of identity of these actions as an expression of the community, of technical quality, of dissemination, of personal and collective valorization. Faced with this problem and understanding
cultural practices as dynamic and changeable, craft activities must adapt to a new scenario.

This scenario is a market with competition with digital artifacts and industrialized products with very different characteristics from artisanal artifacts. For Borges (2011, p.204), “handcrafted objects appear as a counterpoint. In a virtual world, they offer a real experience. Instead of the uniformity and standardization of industrial objects, they are unique, never identical. "With this, the craft needs to consolidate its concept and its differentiating characteristics to be chosen for itself (functionality, aesthetics and symbology).

As an action strategy, the participation of design in artisanal communities presents itself as an effective possibility of guiding these changes. Design is presented as the act of identifying a problem and the creative intellectual effort of the sender, who presents solutions through drawings and plans that include schematics and specifications to be absorbed by the receiver. “In the communication process, both the sender and the receiver are active partners” (Wolf, 1999, p.29). Fujita and Barbosa (2020), based on a bibliographic review (finding 08 articles) observed that design has been working to optimize the activities of social and/or solidarity companies (such as craft cooperatives) as it has analytical tools for evaluation, identification and indication productive activity and business as processes, actors, resources, among others.

Due to the volume of information involved in productive activities and crafts, information design was of fundamental importance for the compilation of information and mainly to make it understandable in an efficient and clear way for the general public. This is justified because “the main objective of information design is the clarity of communication” (Pettersson, 2012). The IIID (International Institute for Information Design) (2022) contextualizes information design from the concepts of information and design, with information defined as the result of processing, manipulating and organizing data in a way that adds knowledge to the receiver.

And, second, Scariot and Schlemmer (2012), information design is the definition, planning and elaboration of the content of a message and the environments in which they are presented, with the intention of satisfying the information needs of the recipients. Updating some of these definitions, the International Institute for Information Design itself presents a modification by the idX group – information design interchange (Egger, 2013) explaining information design as “it is the definition, planning and modeling of the content of a message and of the environments in which it is presented, with the intention of satisfying the information needs of the intended recipients”, this definition IIID being modified by the idX group (IIID, 2022).

Care with the way information is presented is essential for the research results to be productive, so that they can be used, reviewed and consulted whenever necessary, “…messages must be carefully designed, produced and distributed to, more later be correctly interpreted and understood by the majority of individuals within the intended audience.” (Dick, Gonçalves and Vitorino, 2017).

Without a proper presentation, the information becomes just an accumulation of data, not corresponding to the real value of the research that can be better recognized if the information is easily
identified and understood. Establishing effective communication between the main characters interested in the research content presented in the booklet is the main objective.

Due to the need for visual presentation of information, a booklet can be an important material. It organizes and exposes information, making it accessible to institutions that promote intervention projects, to designers and artisans, in addition to the general public. The booklet must have a printed and digital version, since “the need for effective information spreads through all means” (Baer, 2009).

The work between design and craftsmanship has been taking place through intervention programs such as the Brazilian Crafts Program, Artesol, the SEBRAE Crafts Program and Imaginary. Borges (2011, p. 215) emphasizes that "less tangible than the economic impact, the social transformation provided by the programs is no less important." From these actions of approximation between center and periphery, often with discrepant approaches, a common thought is perceived: replacing welfare policy with a model that encourages collectivism and entrepreneurship (Borges, 2011). In fact, social transformation is observed in most of the initiatives, mainly in the increase in the self-esteem of the actors involved.

Krucken (2009, p. 17) highlights that "the strengthening of relationships with educational, research and entrepreneurship support institutions is essential to promote the development of the territory. These relationships stimulate the interaction of professionals from different areas of knowledge in the search for together for innovative solutions, strengthening the system vision."

However, as Wanderley (2018) points out, problems are still identified in the consolidation of this interaction between crafts and design, with the programs, presenting itself as the research problem of this study. Lost knowledge, actions not continued or not employed, setbacks of processes are examples observed when the programs are completed.

Although the stakeholders understand the programs in depth and have experience in these processes, they are not part of the real scenario of productive activity and artisans. Its analysis takes place from an outside-in perspective. Discussion with artisans would validate and complement this diagnosis from an internal point of view.

Handicrafts must be worked on based on social entrepreneurship. According to Ashoka Social Entrepreneurs and Mackisey and Cia. Inc. (2001), social enterprises produce social values through innovation for the benefit of social, economic and community development. As Melo Neto and Froes (2001) point out, the intention is no longer “the business of the business”, but “the business of the social” with civil society being the center of action and partnerships between the community, the government and the private sector. being the strategy. Oliveira (2004) still complements is not (a) corporate social responsibility (actions centered on the company's mission and activity), (b) a social organization (production and revenue generation with the sale of products and services); (c) represented by an investor in the social field, social charity or philanthropy; (d) Therefore, it must involve (and does involve) actions and initiatives of innovation, creativity and sustainability aimed at solving social problems, maximizing the social capital of communities, and collective representation.
The creative economy must also be a strategic one. According to the Ministry of Culture (2011, p.22) “the creative sectors are those whose productive activities have as their main process a creative act that generates a product, good or service, whose symbolic dimension is determinant of its value, resulting in production of cultural, economic and social wealth”. Therefore, it must have as guiding principles: (a) cultural diversity, (b) sustainability, (c) innovation and (d) social inclusion.

Productive activities, especially crafts, need to work and be concerned with multiple and integrated contexts, as Wanderley (2015) points out: economic, educational, cultural, social and political. Gamem (2016) agrees with these dimensions, organizing them into: environmental, social, economic and social intelligence. Environmentally, it indicates the use of reused raw materials and “local endogenous resources” (Gamem, 2016, p.15). In the social field, it values actors, culture and local memory. In the economic scenario, to be guided by the plural economy (solidarity, creative and market). Collective intelligence is composed of collective dialogue with the construction of partnerships (civil society, public and private companies, society and the productive community itself).

In addition, the sustainable value of maintaining the artisanal practice is highlighted. Manzini and Vezzoli (2005, p.23) talk about “proposing the development of design for sustainability means, therefore, promoting the capacity of the productive system to respond to the social demand for well-being using an amount of environmental resources drastically lower than the levels currently practiced”. Even referring to environmental resources, this article makes use of this idea to focus on human resources and how much design can improve, sustain this resource, through good practices and strategies.

Several researches and projects have been aimed at introducing the culture of design in diverse artisanal productive communities. They already point out some basic guidelines. Fernandes (2021) believes that collaborative work between design and craftsmanship should happen through a systemic approach, continuous process, participation of all, gathering experience, collaboration, co-creation. Sasaoka (2022) believes that a social design program should be based on (a) diagnosis or recognition of context, (b) articulation, (c) social learning and (d) construction of the notion of autonomy” (SASAOKA, 2022, p 35) and be structured in activities with periods, objectives, semi-defined results. Martins, et al (2022) point out the socialization between the actors for the sharing of the “artisanal popular experience” as an important aspect with the establishment of paths beyond the economic context. Marcia & Maria (2022), comment:

“This exchange of knowledge between designers and artisans is necessary, since the changes that have taken place in the field of handicrafts usually come from the personal taste of the artisans attributed to artisanal products, that is, many artisans create from the perspective of the artist, or that is, the products are based on your personal taste, without the concern of carrying out a previous study to get to know the consumer public, their desires and tastes.” (Márcia & Maria, 2022, page 175)

Therefore, this research aimed to build guidelines for design intervention programs in artisanal productive communities. It also sought (a) the identification of the positive and negative points of some intervention programs, (b) the structuring of the process of interaction of craft and design knowledge and
The information was organized into topics, separated by types and numbered. Preparing content and its presentation was a challenge in which information design was the main tool, considering “the art and science of preparing information so that it can be used by humans efficiently and effectively” (Horn, 1999).

But in addition to organizing the information, representing it visually for efficient and effective communication was also challenging and inspired the preparation of the booklet that will be presented later in this article. The visual demands that should guide the booklet were defined with the division of information, establishing the main groups of the guidelines and representing them with icons, in order to facilitate understanding.

2 METHODOLOGY

This article classifies the research as being of an applied nature, due to the preparation of the booklet as a final product. Regarding the objective, it has an exploratory nature, as it brings to the research universe the empirical reality observed with the artisans. The approach to the problem is qualitative, since it has no interest in quantifying or presenting statistical relevance of any data presented (Silva & Menezes, 2011).

The thematic delimitation of this research addresses craftsmanship and design intervention as main themes. As for the population and spatial delimitation, it is an analytical-qualitative research with conversation with 100 artisans from 16 communities about the intervention programs in which they participated.

For that, an analytical-qualitative research was developed. Knowledge was built by the critical analysis of information (criticism and praise) of the objects of study (the artisans). And he was concerned with the existence and meaning of the facts themselves and not with their periodicity, working with information regardless of their frequency of occurrence and the size of the sample.

It involved the inductive approach method when working particular cases (communities) for general conclusions (main problems and important aspects for intervention programs in design). In the total context, it qualifies with the structuralist procedure method when seeking the integration of multiple knowledge, the development of an orientation structure (the guidelines and the booklet) to represent and work the object of study (the integration of crafts and design).

As a research technique, the semi-structured interview in the form of informal conversation was used, with an emphasis on the artisans' evaluation of the intervention projects in which they participated. It took place in a collective environment of the community and involved the participation of 100 artisans from 16 different communities. The conversation was mediated by the research researchers with the introduction of some basic questions.
3 RESULTS AND DISCUSSION

The search

In the conversation/interview with the artisans, they presented 29 problems and 28 general strengths of the intervention programs in which they participated. This issue revolved around (1) the project itself, in relation to elaboration, temporality, people and content, and (2) the project's actions on content, temporality and people, but also didactics and structure.

Negative points of the projects

1. Project ready – without the participation of the group;
2. Short design;
3. Discontinued project;
4. Unfinished project;
5. Project restricted to training;
6. Little promotion action;
7. Little marketing action;
8. Widely spaced actions;
9. Strict guidance/correction workshop;
10. Very theoretical classes with little practice;
11. Non-consolidation of the techniques taught;
12. Content of the workshops not suitable for the group (too restricted or too varied);
13. Courses with workload distribution not suitable for the group (considered short or long);
14. No stimulus and training for creation (such as ready-made drawings);
15. Little variety of courses;
16. Proposal of non-differentiated products;
17. Proposal of activities and copy products;
18. Products without personal or community identity;
19. Inadequate materials (expensive, difficult to obtain, or lack of identification with the artisan);
20. Techniques without individual or community identity;
21. Decontextualization: technique not adaptable to the material and equipment used by the community;
22. Workshop not suitable for the development of the technique;
23. Workshop not suitable for guidance, mainly to work errors;

Positives of the projects

1. Long projects;
2. Constant and easy contact with stakeholders;
3. Easy contact with those responsible for the project;
4. Donation of equipment and materials;
5. Opening hours and days of accessible workshops;
6. Adequacy of working hours to the availability of artisans;
7. Participation of artisans as instructors;
8. Language accessible by teachers;
9. Qualified and active teachers;
10. Patient teachers;
11. Efficient teaching methodology;
12. Development and improvement of products already developed;
13. Artisans’ understanding of the need for new products;
14. Artisans' understanding of the need for more contextualized designs;
15. Artisans' understanding of quality control and management;
16. Understanding on the part of artisans of the need to take care of their waste;
17. Visits to successful cases;
18. Technical visits to the market;
19. Introduction of new themes;
20. Work with recyclable material;
21. Adaptation of techniques;
22. Product Mode Identification;
23. Color Workshop;
24. Sales classes;
25. English classes;
26. All artisans go through all stages of the project;
27. Theoretical and practical understanding of the entire process of each participating artisan;
28. Promotion of products at fairs;
29. Psychological support when needed.

In addition to these direct results, it was also possible to conclude some characteristics of the community that facilitate and hinder the execution and maintenance of the actions of the intervention projects. They are not definitive but have an influence on the progress and consolidation of projects. They are quite varied but cover domains, people, structure, products and processes.

Community facilities for the development of intervention projects
1. Interest and love for the activity;
2. Defined leadership;
3. Leader with collaborative character, initiative and great curiosity;
4. Leader with critical ability and creativity;
5. Leader with teaching ability;
6. Trained leader;
7. Collaborative spirit;
8. Exclusive dedication;
9. Willingness to change;
10. Willingness to learn;
11. Willingness to invest financially;
12. Specific and “own” production space;
13. Specific and “own” marketing space;
14. Consolidated traditional technique;
15. Easy to pass technique;
16. Artisans trained in the technique;
17. Varied productive activities;
18. Material available in the community,
19. Awareness of the need for community crafts to have an identity;

Community facilities for the development of intervention projects

1. Dependence on running projects;
2. Low self-esteem;
3. Financial Immediacy;
4. Insecurity;
5. No leadership;
6. Leader as bosses;
7. No initiative;
8. It does not have a typical raw material;
9. Without a consolidated technique;
10. Product without identity;
11. Great dependence on the Associations to carry out the actions;
12. Not aware of what they want (besides earning money);
13. Non-exclusive dedication

With these two groups of knowledge worked in the research, the guidelines were elaborated.

The Guidelines

An effective change process in any community can only happen if it involves the sharing of thoughts, attitudes and emotions among all participants. This process generates a sense of belonging, creates commitment and stimulates the collectivity. In this sense, Krucken (2009, p. 69) highlights that "the construction of quality relationships demands a strong spirit of collaboration and coordination". Therefore,
the sharing of intentions and objectives among the network actors is fundamental [...] Thus, it is necessary to stimulate the construction of collaborative networks in craft groups.

As Wanderley (2015) comments, this sharing happens with planning (identification of information), execution (sharing of information) and evaluation (reflection of information). Therefore, the program must also be structured in these three actions, making them its basic phases. Also two main qualities are fundamental for the programs: (a) collaboration, effective participation of all in the whole process and (b) flexibility, possibility of its adaptation to the concrete reality of each community and each artisan.

In addition to these two bases, four parameters are active for the structuring, execution and representative effectiveness of the results of the programs: actors, processes, contents and results.

The actors are made up of people involved in the program such as artisans, designers, among others. The means of involving them and the appropriate ways for them to participate are identified. The main objective is emotional involvement, collaboration and autonomy.

The processes represent the actions to be developed. Its necessary characteristics in the temporal, spatial and human domain are pointed out. Contextualized and identity actions are representative and accepted.

The content involves knowledge and topics important to craftsmanship and its production. The main ideas to be worked on are indicated. It focuses at the same time on the identity of the activity and the group as well as on the generation of knowledge and competences.

The results are concrete solutions to basic problems of artisan communities. Some changes, decisions and products necessary for all are indicated. It directly seeks productive sustainability with the satisfaction of the actors.

Therefore, some basic guidelines are:

Actors:

1. Enable the total collaboration of artisans, mainly in the elaboration of the project;
2. Promote accessibility to project members by participating artisans, both during execution and at any time;
3. Involve workshops not only guiding (ordering to be done) but also knowing and doing;
4. Implement the participation of artisans as instructors with the monitoring of project members;
5. Involve instructors and students working in a horizontal, non-hierarchical manner and with reciprocal sharing of knowledge;

Process:

1. Implement long, progressive and comprehensive projects in several areas (such as design, administration, communication, among others);
2. Develop constant actions and without a long time interval between them;
3. Establish continuous and systematic training;
4. Carry out technical visits to learn about successful realities;
5. Develop capacity building through workshops;
6. Conduct workshops with sequential activities;
7. Conduct workshops not only for guidance: first working on a new product with teaching how to do it and only then guiding the improvement of products already developed;
8. Carry out time-spaced workshops so as not to stop production for a long time;
9. Conduct workshops with various exercises, including extra room to assimilate and practice knowledge.

Contents:
1. Work on raising awareness of quality, identity, and concern for waste;
2. Have as base workshops:
   Creativity and new product development,
   Graphic language (color, texture, shape, among other aesthetic-symbolic elements),
   identity,
   pricing,
   management,
   entrepreneurship,
   quality,
   development of high self-esteem and independence;
3. Take advantage of available raw material and community identity;
4. Explore the techniques already developed in the community;
5. Work with community identity techniques;
6. Work on pricing systems suited to the productive and market realities of that type of craft and not just based on hours worked;
7. Work with sales processes and strategies;
8. Include in the workshops the importance of each suggested change (in actions and products) and knowledge worked on.

4 RESULTS
1. Qualify the products already developed;
2. Qualify the processes necessary for the activity;
3. Qualify the structure (space, furniture, machinery and tools) of the activity;
4. Develop new and different / innovative products;
5. Create the group's visual identity and promotional materials (such as catalogs and folders);
6. Establish partnerships;
7. Define price system;
8. Implement marketing techniques
9. Build promotion strategies;
10. Establish tactics to cultivate customers (gifts, personalized products, etc.);
11. Working with collections – new proposals every year,
12. Appoint/identify/prepare a leader;
13. Identify the market, the main and secondary target audience of the craft type.

The Primer

All the information collected and completed in the research was organized in a booklet called Handcrafts Shared (Figure 1). This project was defined because the booklet would be the most effective way to present the knowledge built and for this knowledge to be applied in real contexts.

Figure 1: The booklet

The booklet's organization was complex with a lot of independent and at the same time complementary information having to be presented textually (which is uninteresting and tiring). Therefore, the organization of information in blocks and sub-blocks was started, expressed textually and when possible schematized in infographics.

The first information worked was the concept and characteristics of the craft. It was outlined in an infographic (figure 2) that demonstrates the link between the characteristics of handicrafts and social domains.
The first group of information worked on was the presentation of the research context with its problems (crafts and programs) and its solutions (design intervention and booklet). All content was verbalized textually (introduction of this article) and also outlined in Figure 3.

The result of the research (the research and the guidelines of this article) was organized in 03 groups of knowledge: (1) Diagnosis of Projects Reported by the Community (2) Influencing Parameters concluded by the researchers and (3) Guiding Guidelines. This division happened because the conversation (informal collective interview) provided (a) the identification of problems and benefits of the projects implemented according to their participating artisans (diagnosis) but also (b) the conclusion of some characteristics of the community that facilitate and hinder the development of intervention projects (parameters) that together
The diagnosis is composed of the problems and successes pointed out by the artisans participating in the various projects developed. The parameters are constituted with the facilities and difficulties characteristic of the communities that positively and negatively influence the development of projects identified by the researchers. All these contents were presented verbally with schematization only of the organizational structure.

Finally, the guidelines represent the main basic instructions concluded from the diagnosis and parameters for the elaboration, execution and maintenance of intervention projects in design in artisanal productive communities. They were structured in 04 pillars: (1) actors, (2) processes, (3) content and (4) Result. The actors represent the people who are part of the project, including the stakeholders (project representatives: designers, among others), artisans and their partners. Process consists of the actions proposed and/or developed with the project. The content is established as the themes and the knowledge and themes important to the craft and its production worked in the projects. And the results are the benefits achieved as the project, the concrete solutions to basic problems of artisan communities. Its internal content was expressed textually, but its structure was schematized in Figure 4.

Figure 4: Outline of guidelines (used with permission of the authors, direct search).
5 FINAL CONSIDERATIONS

The Handicraft Shared booklet is still theoretical, having not been used in real situations nor used by project participants. However, even if its effectiveness is not proven, it is established because the content of the booklet was built with information derived from real and direct contexts of artisanal communities. In addition, the structure of the booklet was developed based on information design principles.

The methodology used proved to be effective. The origin of the information involving subjects directly related to the theme, the artisans participating in design intervention projects, provides contextualized information. The number of artisans and communities involved was significant and with different characteristics allowing for greater coverage and variability of information. Also, the analysis and conclusion of the information taking place through experienced researchers in the area of intervention build grounded guidelines.

Even given the competence of the booklet and its construction, some suggestions for future work can be pointed out both for its optimization and for the expansion of its application. Other knowledge bases will allow you to confirm, adjust or modify some information in the booklet.

As an analytical basis, the booklet can be compared with other intervention approaches already developed with important activities, such as (a) O Imaginário, (b) Artesol, (c) SEBRAE handicraft program and (d) Brazilian Handicraft Program. These present their performance parameters as well as their guidelines already applied, allowing: (1) to define common aspects and (2) particularities. With this, they can point out weaknesses and innovative aspects of the booklet that can be further worked on to minimize or confirm them respectively.

The vision of the stakeholders of different programs is also important as they are on the “other side” of productive activity and intervention programs as evaluators and instructors. They would point out the difficulties and facilities encountered when they acted, thus indicating new parameters not perceived by the artisans.

Experimenting with the booklet in practice would assess its performance. It can happen in 02 contexts: (1) practical application and (2) analytical application. The booklet can be the basis for a case study in which its guidelines will be put into practice for carrying out a design intervention program in a community. It can also be used as an analytical model for the evaluation of other interventions, explaining their strengths and weaknesses.

Finally, it is observed that the intervention programs themselves and their projects can be bases for self-assessment and external assessment of their capacity for transformation. Also, its participants, more precisely the artisans, provide important information at a structural, human and technical level for the evaluation and construction of design intervention projects.
REFERENCES

**ABSTRACT**

The movement of social responsibility and corporate governance, currently, is fraught with tensions, especially in the way in which companies have consolidated their actions in the vast field called “social”. In Brazil, it was only in the 1990s that sectors of the business community began to deal with the issue of valuing the diversity of the workforce more consistently. Given this reality, the importance of the Corporate Governance movement is evident, which consists of a system that works to optimize the performance of a company, that is, it is about directing, monitoring and encouraging companies, involving relationships in all parties, such as partners, investors, employees and creditors, facilitating access to capital. Within these principles, in this study, equity stands out, which is established in equivalence, in the fair treatment of all partners and stakeholders, and is in meeting the rights, duties, needs, interests and expectations of all interested parties. The present research consists of an exploratory, descriptive study with a quali-quantitative approach in the form of a case study on the understanding of racial equity in companies in the city of Sinop and its surroundings. For the measurement, the answers of the interview questionnaire were identified, which obtained a “Yes” or “No” answer, each “Yes” corresponds to 1 point and the “No” corresponds to 0 point, each company being able to obtain a maximum of 13 points. Therefore, concisely, small companies, which were part of this research, and with a few years of existence, have a tendency to be fickle about the understanding of equity. The vision of intending only to obtain profit makes a company weakened in its attributes and uniqueness. Its virtue is exposed to society when it shows itself diligent to human aspects.

**Keywords**: Corporate Governance, equity, Racial Equity.

**1 INTRODUCTION**

The movement of social responsibility and corporate governance is currently riddled with tensions, especially in the way in which companies have consolidated their actions in the vast field called “social”. In Brazil, it was only in the 1990s that sectors of the business community began to deal with the issue of valuing the diversity of the workforce more consistently (Góis, 2015).

Any and every environment where people with distinct cultural identities and meanings are found constitutes a social system in which there is diversity, and these differences, between people and groups, are perceived in organizations, as the homogeneity of the workforce is characteristic, which gives rise to diversity. Diversity is realized in differences, whether in terms of race, ethnicity, gender, sexual orientation, language, culture, religion, mental and physical abilities, class and emigrant status. Given this reality, the importance of the Corporate Governance movement is evident, which consists of a system that works to optimize the performance of a company, that is, it is about directing, monitoring and encouraging companies, involving relationships in all parties, such as partners, investors, employees and creditors,
facilitating access to capital. The basic principles of Corporate Governance are classified as: Transparency, Equity, Accountability and Corporate Responsibility. Within these principles, in this study, fairness stands out, which is established in equivalence, in the fair treatment of all partners and stakeholders, and is in meeting the rights, duties, needs, interests and expectations of all interested parties. (DESCONCI, 2007).

Organizations obtain diversity as a benefit, as difference adds value, and in order to achieve this benefit, organizations need to have a solid policy, it is necessary to institute principles and develop human resources practices aimed at promoting equity and preventing discrimination against of any nature, including gender and race. The issues of inclusion and equity are in the current scenario, and their primacy is effective in a multicultural society in constant change. (Zauli, 2013).

According to Seabra (2017) the characteristics of inclusion are established in the concept of a process that helps to overcome obstacles that limit the presence or participation of an individual, and the concepts of equity are defined in the concern for justice and the attribution of rights. Equal importance for all, therefore, “Equity is that which is based on the special circumstance of each concrete case, concerning what is fair and reasonable” (Ferreira, 2021), equity accompanies the law, and the seriousness of this concept linked to the organizations means defending the right of all parties involved, such as partners, investors, employees and creditors, so that they can fulfill their full potential and make their contribution meaningful to the organization (Zauli, 2013).

Proceeding in this context, the general objective of the study was to analyze whether companies in the city of Sinop and its surroundings understand racial equity.

The composition of the answers given to this study was followed by the analysis and comparison with scientific works, such as books and articles.

The present article was structured in five sections: introduction, theoretical foundation, methodology, case study and conclusion.

It is assumed through this study, to collaborate with scientific research in relation to the principle of Equity in Corporate Governance, and contribute to improve the knowledge of this subject for the respective researchers. The veracity of this principle, presented in this study, leads to a fair treatment process, which is understood to be a legal commitment to the achievement of an individual's right, in this way to collaborate with society.

2 THEORETICAL FOUNDATION

2.1 CORPORATE GOVERNANCE

According to the IBGC (Brazilian Institute of Corporate Governance), good Corporate Governance practices convert basic principles into objective recommendations, and becomes aligning interests with the purpose of preserving and optimizing the organization's long-term economic value, thus facilitating their access to resources and contributing to the quality of management in its longevity and common good (IBGC, 2015)
Some authors present the concept of Corporate Governance in a managerial way, exposing the organizational structure and its importance in the value of the company, that is, in a management model that aims to improve the attractiveness of the company, reducing business risks, and aligning the thinking between shareholders, controllers and stakeholders (Administradores, 2014).

The word governance appears and was used for the first time in 1991, through a movement, which began particularly in the United States. and in the following year, the first Code of Best Practices of Corporate Governance was defined, composed exactly in the perception of the use of new rules that would assure them against abuses of the executive boards, with the inefficiency of the boards of directors and with the omissions of the external audits, or that is, it arises from the reflexive action around ethics (Administradores, 2014).

There are, within Corporate Governance, four basic principles that are said to be fundamental, which are: (IBGC, 2015)

- Transparency (disclosure): it is defined as the willingness to provide all interested parties with information that is of interest to them, it is not only about announcing what is provided for in laws or regulations, it is associated with going beyond, and not restrict information.

- Equity (fairness): it is about equivalence, the fair treatment of all partners and stakeholders, is in meeting the rights, duties, needs, interests and expectations of all interested parties.

- Accountability: in a succinct, understandable and clear manner, governance agents will account for their execution, and absolutely assume their acts and omissions, acting with diligence and responsibility.

- Corporate Responsibility (Compliance): brings strict compliance with the law and responsibility to governance agents to ensure the economic and financial viability of organizations, take care of the interests of the corporation, reducing negative externalities, increasing positive ones and taking into account the various capital (human, social, intellectual, environmental, financial, reputational, etc.) in the short, medium and long term.

2.2 THEORY OF ORGANIZATIONAL EQUITY

According to the IBGC, equity is characterized by fair and isonomic treatment of all partners and other interested parties (stakeholders), taking into account their rights, duties, needs, interests and expectations.

Equity is related to the commitment to abolish inequality, it is linked to the concept of “fairness”, which we would translate as “justice”. Through this conception, it is assumed that a society, institution or structure that does not promote access and participation in an equitable way is “unjust”, since it penalizes and discriminates against people for factors that are alien to their humanity and even to their merit (WAY, 2017).

Within an organization, the precepts of equity, the correct mitigation of risks and the search for inclusion and promotion of diversity guide organizations towards the generation of value. Currently, we
live in a scenario that reinforces the tendency to rethink and give a new meaning to social relationships. It is necessary to understand the value of diversity and inclusion, and encourage a culture that promotes respect, admiration and appreciation of the individual (IBGC, 2016).

According to TAMAYO and PASCHOAL (2003), “equity is an endogenous theory, that is, a fundamental assumption that people are motivated by the need to receive equitable treatment”. Equity theory determines that individuals are motivated to obtain a situation of justice or equality in their relationship with other individuals and with organizations. Given this fact, there are the dimensions of organizational justice, a brief definition for, what it is, organizational justice is the psychology of justice superimposed on the environments of an organization, focusing on the perceptions of justice existing in the relationships between workers and their organizations. Within this dimension of organizational justice, the Motivational Theory and the Interactional Theory are emphasized (ASSMAR, 2005).

- Motivational Theory: According to Sancho et al. (2002), the term motivation is used, in general, to portray the internal and external forces that act on people, forces that direct their conduct. The meaning of motivation itself can be put in conflict with the concept that motivation oscillates between the individual's response to external stimuli to attitudes and behaviors that are instigated by impulses originating in the unconscious mind. For such knowledge, Psychology has been presenting partial answers to questions about human motivation. “the concepts of 'will', 'instinct', 'impulse', 'incentive', 'personal self-fulfillment', 'expectations' have been used as fundamental arguments in the analysis of motivation”.

Motivation in the organizational environment is related to the concept that one has about the employee's perception of the task or activity that he performs. An organizational management needs cost optimization and an increase in productivity and competitiveness, and strictly linked to this need, the understanding of organizational leaders regarding the motivation of human resources is highlighted. Therefore, there are some aspects of motivation in the organizational environment, some of them are: through coercion, financial incentive or other rewards, social interaction, satisfaction of human needs, among others. Also, essential for the implementation of any motivation programs, and to improve the general state of employee satisfaction and their level of performance, it is essential to understand the causes of low motivation for work noted among employees (Gomes, 2003).

- Interactional Theory: Some definitions conceptualize that interpersonal relationships are more determinant in the behaviors, attitudes and conduct of people in an organization than the procedures and benefits. According to Bies and Moag (1986), interactional justice refers to people's conceptions of the "quality of the interpersonal treatment they receive during organizational procedures" (Sousa, 2009).

The theory/interactional justice concerns the social issues involved in the relationships between the people who decide and the people affected by the decisions, for this reason, the importance of trust that the collaborator/employee must have in their boss or supervisor, who, in this way, there will be a contribution to the composition of a work environment highly conducive to productivity, achievement of goals and
individual and organizational efficiency. Perceptions of high theory/interactional fairness exert a powerful influence on employees' feelings of trust (ASSMAR, 2005).

Fair, respectful and dignified treatment evidences positive attitudes, greater contributions and efficiency on the part of the employee, that is, perceptions of justice are the main predictors of workers' conduct within the organizational context. Therefore, developing a system with a measure of justice, based on the multidimensional construction of the organization, that is, taking into account each employee, each aspect, each behavior, will directly contribute to the quality of the relationship between worker and organization.

2.3 REALITY OF RACIAL EQUITY IN BRAZILIAN REGIONS WITH A FOCUS ON MATO GROSSO

According to Pereira (2019), the racial reality in Brazil focuses on a common sense view where there is no such discrimination, however there is a striking inconsistency in people's daily lives. As a direct effect, the non-occupation of blacks in spaces of power, the disregard of black intellectual capacity and the overcrowding of blacks in prisons is demonstrated.

Brazil integrates an official discourse, adopted from the 1930s, where it presents the politics of racial democracy. These foundations contribute to the social intellectual illusion that there is no racism in our nation. This act of denial of racism makes it impossible to combat it, which results in proof that, vigorously, racism continues to transpose social relations in the country, even in the face of a “racial democracy” (Pereira, 2019).

The table below presents a survey prepared by the National Victimization Survey, by the Ministry of Justice in 2013, 346 Brazilian municipalities were selected, generating a total of 78,525 respondents. The research refers to the fact that the individual has suffered victimization due to racial discrimination, and presents zero values when there was no discrimination and value one for the case in which there was discrimination (Silva, 2017).

In this way, the wide field of research existing in the scenario of racial discrimination is remarkable. To restrict the study in its objective, we will proceed with the region of Mato Grosso, located in the center-west of Brazil, the second largest territorial extension of the country, however the least populous, contains 141 municipalities, with Cuiabá its capital, currently with 3.224 million inhabitants. The population of the state is made up of people of different ethnic compositions. According to IBGE data, the distribution is as follows: Pardos – 55.2%; Whites – 36.7%; Blacks – 7%; Indigenous – 1.1% , the state has great cultural plurality (Francisco, 2021).

In mention of racial discrimination, the state brings in its records of occurrences the reduction of racial prejudice. According to research presented by Jornal Gazeta Mato-grossense, the 11% drop was recorded in the months from January to October 2020, for which it is notable that, even in the case of criminal conduct, there are those who choose not to notify the authorities: “No We didn't make any records because we know it won't help”, laments the 30-year-old dancer Maria Aparecida Lima de Araújo Rondon, noting that while walking through the corridors, they were accompanied by the security guards at the shopping center. The challenges concerning racial prejudice are still present and every day a new case arises. This real context presents the absence of attitudes that contribute to fair treatment in interpersonal relationships, there are large gaps of racism in the social culture where hostility and discrimination act explicitly (Araújo, 2020).

3 METHODOLOGY

3.1 DEFINITION OF THE TYPE OF SEARCHES

According to Rodrigues (2007), scientific methodology “is a set of approaches, techniques and processes used by science to formulate and solve problems of objective acquisition of knowledge, in a systematic way”. This scientific method is composed of several sub-methods and techniques, some depending on the field of knowledge and depending on the objects on which they focus.

The present research consists of an exploratory, descriptive study with a quali-quantitative approach in the form of a case study on the understanding of racial equity in companies in the city of Sinop and its surroundings.

The case study is characterized by the deep and exhaustive study of one or a few objects, in order to allow their broad knowledge, a task practically impossible with the other types of designs considered.

According to Yin (2005, p. 32), the case study is an empirical study that investigates a current phenomenon within its context of reality, when the boundaries between the phenomenon and the context are not clearly defined and in which they are used. various sources of evidence.

The case study has been used more frequently by social researchers, as it serves research with different purposes, such as: exploring real-life situations whose limits are not clearly defined; describe the situation of the context in which a particular investigation is being carried out; and explain the causal
variables of a given phenomenon in very complex situations that do not allow the use of surveys and experiments.

As stated by Cardoso et. al. (2010), “each researcher thoroughly analyzes the work of the researchers who preceded him and, only then, having understood the testimony entrusted to him, he leaves equipped for his own adventure”.

3.2 DATA COLLECTION METHOD

According to Pizzani et. al (2012), bibliographic research is understood to be a review of the literature on the main theories that guide scientific work. This review is what we call a bibliographic survey or bibliographic review, which can be carried out in books, periodicals, newspaper articles, internet sites, among other sources.

To measure the understanding of racial equity in companies in the city of Sinop and its surroundings, bibliographic research was used. In addition, a questionnaire was composed that was sent to three companies, located in the city of Sinop-MT and its surroundings and which were answered by them.

For the analysis of the case study of racial equity in companies in the city of Sinop and its surroundings, a graph covering the responses collected through the questionnaire was considered.

3.3 SEARCH LIMITATION

The first limitation of the study is the case study method itself, which occurs in the impossibility of generalization to the universe of companies, in this way this study is limited to the city of Sinop and its surroundings, analyzed from March/2021 to May/2021, as the questions were answered by analyzing them. Another limitation is the research protocol used, as there may be properties represented by the subjectivity of the researcher.

4 PRESENTATION OF RESULTS

4.1 PRESENTATION OF DATA

For data collection, a questionnaire was applied, which was sent through the WhatsApp digital platform, containing sixteen questions, where the research focused on three companies, located in the region of Sinop-MT and its surroundings.

Table 1, represents the questionnaire surveyed for the research, were addressed through 16 questions, the first 6 of which represent the segment, the regime and the size of the company, and then the other questions will present the perceptions of the companies to the which refers to equity.
### Table 1: Research Questionnaire

<tr>
<td>1. What position or function does the interviewee occupy in the company?</td>
<td>General Manager/Director</td>
<td>General Manager/Director and Accountant</td>
<td>General Manager/Director</td>
</tr>
<tr>
<td>2. How long has the company been in Sinop and/or surroundings – MT?</td>
<td>up to 5 years</td>
<td>over 20 years</td>
<td>up to 5 years</td>
</tr>
<tr>
<td>3. Company identification data</td>
<td>Toilet</td>
<td>Toilet</td>
<td>Toilet</td>
</tr>
<tr>
<td>5. Considering the Annual Gross Invoicing and according to the classification of the Federal Revenue Service of Brazil, in what size does the company classify itself?</td>
<td>PPE</td>
<td>ME</td>
<td>ME</td>
</tr>
<tr>
<td>6. Which company employee number?</td>
<td>up to 19 employees</td>
<td>up to 19 employees</td>
<td>up to 19 employees</td>
</tr>
<tr>
<td>7. Does the company have an organizational unit called Corporate Governance (which appears in the organizational chart or which actually exists)?</td>
<td>No</td>
<td>Yea</td>
<td>No</td>
</tr>
<tr>
<td>8. Who manages the company knows Organizational Equity practices?</td>
<td>Yea</td>
<td>Yea</td>
<td>don't know how to say</td>
</tr>
<tr>
<td>9. Recognition of your actions in favor of Racial equity. Has the company received any awards or recognition for its actions in favor of racial or gender equity?</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
<tr>
<td>10. (If yes), indicate which ones:</td>
<td>-</td>
<td>-</td>
<td>-</td>
</tr>
<tr>
<td>11. Does the company have an established document describing its Positions and Salaries Policy and describing the Positions, Functions and Salaries (manual of positions and salaries)?</td>
<td>No</td>
<td>Yea</td>
<td>Yes, but not formally established.</td>
</tr>
<tr>
<td>12. Practices for disclosing the company's positioning in favor of Racial equity:</td>
<td>The company invests in social projects related to racial equity</td>
<td>The company's leaders publicly take a stand on racial equity and valuing diversity.</td>
<td>The company has other relationship policies with the external public in favor of racial equity.</td>
</tr>
<tr>
<td>13. Strategies to identify barriers to Racial Equity (internal and external). In general terms, does the company identify and seek to eliminate possible barriers to the promotion of Racial equity? If yes, through which of the strategies below?</td>
<td>There was no answer!</td>
<td>Yes, and the company carries out a census or monitoring of the lack of racial equity in the workforce.</td>
<td>No, the company does not identify or seek to eliminate potential barriers to the promotion of racial equity.</td>
</tr>
<tr>
<td>14. On the actions that fight the lack of racial equity: Indicate Yes or No</td>
<td>(Action 1) - Yes; (Action 4) - No; (Action 2) - No; (Action 3) - No.</td>
<td>(Action 1) - Yes; (Action 4) - Yes; (Action 2) - Yes; (Action 5) - Yes; (Action 3) - Yes.</td>
<td>(Action 1) - Yes; (Action 4) - Yes; (Action 2) - Yes; (Action 5) - No; (Action 3) - Yes.</td>
</tr>
<tr>
<td>15. Regarding the role of Organizational Equity, select from the options below the one(s) that you consider most appropriate (you can select more than one)</td>
<td>Look at the benefits they have, such as salaries, promotions, merits, growth opportunities, among other factors, and compare all of this to their own skills and abilities.</td>
<td>Recognize that everyone needs attention, but not necessarily the same care; Support the use of knowledge and skills of the employee, who feels motivated and delivers more efficiency;</td>
<td>Treat equality as a principle of human dignity, insofar as granting equal treatment is the same as granting equal dignity to all.</td>
</tr>

4.2 DATA ANALYSIS AND INTERPRETATION OF RESULTS

To measure each company, the answers to the interview questionnaire were identified, which obtained a “Yes” or “No” answer, each “Yes” corresponds to 1 point and the “No” corresponds to 0 point, each company being able to obtain a maximum of 13 points. A “research axis” was used, where only thirteen questions were selected, which are: a 7;8;9;11;12;13;14.1;14.2;14.3;14.4;14.5;15 and 16, according to shown in the Graphs below.

This analysis will be measured individually for each company, to display individual understanding, and for the data to be displayed distinctly. Therefore, understanding is necessary in understanding the equity of each company.

Below are the analyzes and interpretations of the results:

The deduction offered by the data collection, defines, according to Graph 1, that company 1 reached the percentage of 38%, equivalent to the understanding of racial equity.

Company 1 assimilates equity in an apparent way, its answers were effective in only 5 questions out of a total of 13.

Gráfico 1. Mensuração da Empresa 1

Fonte: Projeto Integrador (2021)
According to Graph 2, the measurement of company 2 defines the percentage of 92% reached to the equivalent of understanding racial equity.

Company 2 assimilates equity in a coherent way, the effectiveness of its answers is achieved through 12 questions out of a total of 13.

In view of the deduction shown in Graph 3, company 3 reached the percentage of 62%, equivalent to the understanding of racial equity.

Company 3 assimilates equity in an expressive and convincing way, as the effectiveness of its answers is achieved through 8 questions out of a total of 13.
Graph 4 defines the comparison between the companies interviewed. The contrast between each company's understanding of racial equity is shown in percentage. The understanding of racial equity occurs in a total of 100%, where company 1 makes up 20%, company 2 - 48% and company 3 - 32%.

Gráfico 4. Comparação das Empresas

Faced with such definitions, the insufficiency of companies regarding the understanding of racial equity is affirmed, the level of understanding and practice are unskillful. However, the years of existence of the company are considerable, which are favorable or not to a maturity regarding the subject. According to data presented by the company Low Interest, 2018, “financial and management experts say that the time for the company to start making a profit, instead of just covering its expenses, will be approximately 2 years and 9 months”. The consideration of such information is remarkable, as a company that is still developing its balance between expenses and earnings will require more time in the knowledge and understanding of profits, which is its main objective, since these are private sector companies.

5 CONCLUSIONS AND RECOMMENDATIONS

According to Way (2017), equity is related to the commitment to abolish inequality, it is linked to the concept of “fairness”, which we would translate as “justice”. Through this conception, it is assumed that a society, institution or structure that does not promote access and participation in an equitable way is “unfair” since it penalizes and discriminates against people for factors unrelated to their humanity and even to their merit.

Fair, respectful and dignified treatment evidences positive attitudes, greater contributions and efficiency on the part of the employee, that is, perceptions of justice are the main predictors of workers' conduct within the organizational context. Therefore, developing a system with a measure of justice, based on the multidimensional construction of the organization, that is, taking into account each employee, each
aspect, each behavior, will add value to the organization, as it will directly contribute to quality, company development and growth.

This study analyzed whether the companies in the city of Sinop and its surroundings, which are part of this study, understand racial equity, measured by a questionnaire, developed by the authors of the study, which covered the understanding and definition, based and founded on the equity concepts.

It is concluded that equity is the one that is based on the special circumstance of each concrete case, concerning what is fair and reasonable. In this way, a company must assume an equitable character, one that understands the value of diversity and inclusion, and encourages a culture that promotes respect, admiration and appreciation of the individual.

Therefore, concisely, small companies, which were part of this research, and with a few years of existence, have a tendency to be fickle about the understanding of equity. The analyzed companies understand equity in a partial way, they still comprise notable failures, mainly in the recognition of their actions in favor of racial equity and in the strategies to identify and seek to eliminate possible barriers to the promotion of racial equity. This study was careful to highlight that, in view of the companies surveyed, there is still a need for development and interest in understanding racial equity.

The vision of intending only to obtain profit makes a company weakened in its attributes and uniqueness. Its virtue is exposed to society when it shows itself diligent to human aspects. For that, a small company in its few years of activity, can reach a maturity, referring to equitable practices, if it admits the search of “knowledge” as an area, of growth and business development.

ABSTRACT
Energy efficiency in buildings and residences is today a primary objective for energy policy at national and international level. This article presents a review of desiccant wheel air conditioning models using solar energy or waste energy as a source of regeneration heat. The physical-mathematical modeling of the rotary desiccant dehumidifier is also presented. The advantages of using the rotary desiccant air conditioning system are discussed as it combines desiccant dehumidification and evaporative cooling technologies. What's more, it's CFC-free, uses little heat energy that can be diversified (solar energy and/or waste heat), and controls humidity and temperature separately. Recent research works suggest that new desiccant materials and their configurations have significant potential to improve the performance and reliability of the process, reducing the cost and size of the dehumidification and air conditioning system with rotary dehumidifiers, thus increasing its competitiveness in the market.

Keywords: Desiccant wheel, Refrigeration, Regeneration heat, Solar energy.

1 INTRODUCTION
A conventional air conditioner consumes a large amount of electrical energy, especially in hot and humid weather conditions, due to the high latent load that is defined by external conditions (TIWARI, 2015). In addition, it uses environmentally harmful refrigerants and consumes primary energy inefficiently (JANI; DEEP; SOHAM, 2018).

The low exergetic efficiency of conventional air conditioning systems, negative environmental impacts and depletion of fossil fuel reserves reinforce the need for alternative techniques that effectively employ renewable sources of low-quality thermal energy (RAFIQUE et al., 2016).

The need for refrigeration systems that are more energy efficient and less likely to pollute the environment has led to the development of systems using a desiccant wheel (NETI; WOLFE, 2000). Desiccant air conditioning is an attractive technology because it is free of ozone-depleting CFCs.

The desiccant wheel has an adsorbent regeneration section, in which heat from various sources is used, such as: heat pump (TU, WANG and Ge, 2018; HUA; GE; WANG, 2019), solar energy (GAGLIANO et al., 2014; HASSAN, 2014) and waste heat from industrial activities (JANI; MISHRA; SAHOO, 2016). The use of renewable heat sources such as solar thermal energy reduces electricity consumption as well as achieving substantial fossil energy savings (JANI; MISHRA; SAHOO, 2016).
This work aims to review the air conditioning system by desiccant wheel using solar energy or waste energy as a source of regeneration heat and present the physical-mathematical modeling of the rotary desiccant dehumidifier.

2 AIR CONDITIONING SYSTEMS BY DESICCANT WHEEL

Desiccant wheel consists of numerous air passages that provide large surface areas for mass transfer between the air and the desiccant.

2.1 EVAPORATIVE COOLING SYSTEM

The desiccant wheel is divided into two equal sections (NIA; VAN PAASSEN; SAIDI, 2006):

a) adsorbent or process section is where the adhesion of molecules of a fluid (the adsorbed) to a solid surface (the adsorbent) occurs;

b) regeneration section is where the desorption of water vapor occurs - phenomenon of withdrawal of substance(s) adsorbed or absorbed by the desiccant.

A sketch of the desiccant wheel configuration is shown in Figure 1.

![Desiccant Wheel](image)

Source: BELLEMO et al., 2014.

The air stream to be dehumidified flows through the process section, while the regeneration air stream flows through the regeneration section in the opposite direction. A small electric motor makes the wheel turn, that is, all channels move continuously between the two sections (BELLEMO et al., 2014).

The benefits of using a desiccant dehumidifier are increased comfort due to independent humidity and temperature controls, improved indoor air quality, and the dehumidifiers are CFC free. The main factors for choosing solid desiccants are regenerative temperature, durability and adsorption capacity.
Silica gel is one of the most common adsorbents because it has numerous advantages, such as larger pores, larger surface area and excellent dehumidification capacity (ZOUAOUI; ZILI-GHEDIRA; BEN NASRALLAH, 2015).

2.2 PHYSICO-MATHEMATICAL MODELING OF THE ROTARY DESICCANT DEHUMIDIFIER

In solid desiccant cooling system, the performance of the rotary desiccant dehumidifier is critical to the capacity, size and operating cost of the entire system.

Nia, Van Paassen and Saidi (2006) presented a work that aimed to develop and obtain solutions for a model involving heat and mass transfer in a rotating desiccator to study the performance of an air conditioning desiccant system. The equations presented were studied in order to correlate the temperature and humidity functions with the input conditions of components in air conditioning cycles.

The dehumidifier is a rotating cylindrical wheel of length L and radius R with small channels, whose walls are adhered by the silica gel adsorbent. It is divided into two equal sections: the adsorbent section and the regeneration section. The scheme of a rotary desiccator is illustrated in Figure 1 and the analysis is based on the following assumptions (NIA; VAN PAASSEN; SAIDI, 2006):

a) axial heat conduction and water vapor diffusion in air are negligible;
b) axial molecular diffusion within the desiccant is negligible;
c) there is no radial gradient of temperature or humidity in the matrix;
d) the hysteresis in the sorption isotherm for the desiccant coating is neglected and the heat of sorption is assumed constant;
e) the channels that make up the wheel are identical to constant heat and mass transfer surface areas;
f) thermal and moisture properties of the matrix (support material / desiccant and adsorbed water) are constant;
g) channels are considered adiabatic and impermeable;
h) the mass and heat transfer coefficients are constant;
i) the heat of adsorption per kilogram of water adsorbed is constant;
j) transport between two air streams is neglected.
2.2.1 Mass transfer equation for air flow

The mass transfer in the air stream is given by:

\[
\frac{d}{dt}\left(\rho_g \frac{A_g L}{A_c}\right) = U_g A_g \rho_g (\omega_i - \omega_o) + h_m A_c (\omega_s - \omega) \tag{1}
\]

on what:

- \(\rho_g\) = air density, kg/m³
- \(\rho_v\) = density of water vapor, kg/m³
- \(A_g\) = cross-sectional area for airflow, m²
- \(L\) = rotor depth, m
- \(U_g\) = air speed, m/s
- \(\omega_i\) = initial moisture content, kg/kg
- \(\omega_o\) = final moisture content kg/kg
- \(h_m\) = mass transfer coefficient, kg/m²/s
- \(A_c\) = interface area on a channel, m²
- \(\omega_s\) = saturation moisture rate, kg/kg
- \(\omega\) = moisture content, kg/kg

Considering \(D_h\) the hydraulic diameter and \(d_t\) the thickness of the desiccant coating (m),

\[
\omega = \frac{\rho_v}{\rho_g} \tag{2}
\]

\[
\frac{A_c}{A_g} = \frac{2L}{D_h} \tag{3}
\]

and knowing that the equation can be written as:

\[
\frac{d\omega}{dt} = \frac{U_g}{L} (\omega_i - \omega_o) + \frac{h_m A_c}{\rho_g A_g L} (\omega_s - \omega) \tag{4}
\]

Taking \(C_1\) and \(C_2\) as

\[
C_1 = \frac{U_g}{L} \quad \text{and} \quad C_2 = \frac{h_m A_c}{\rho_g D_t A_g} \tag{5}
\]
equation (4) is:

$$\frac{d\omega}{dt} = C_1(\omega_i - \omega_o) + C_2(\omega_s - \omega)$$  \tag{6}$$

Heat transfer equation for air flow

$$\frac{d(\rho_g A_g L C_g T_g)}{dt} = \rho_g U_g A_g C_g (T_{gi} - T_{go}) + h A_c (T_s - T_g)$$  \tag{7}$$

on what:

\(C_g\) = isobaric specific heat of the gas, J / kg K
\(T_s\) = gas saturation temperature, °C
\(T_{gi}\) = initial gas temperature, °C
\(T_{go}\) = final gas temperature, °C
\(T_g\) = gas temperature, °C
\(h\) = heat transfer coefficient, W/m²/K

Equation (7) can be written as:

$$\frac{dT_g}{dt} = C_1(T_{gi} - T_{go}) + C_3(T_s - T_g)$$  \tag{8}$$

on what:

\(C_3 = \frac{h A_c}{\rho_g L A_g C_g}\)  \tag{9}$$

Mass transfer equation for solid desiccant

$$\frac{d(\rho_d A_d L \omega_d)}{dt} = h_m A_c (\omega - \omega_s)$$  \tag{10}$$

on what:

\(\rho_d\) = desiccant density, kg/m³
\(w\) = water content of the desiccant material, kg/kg
\(A_d\) = cross-sectional area for the desiccant layer in a channel, m²
The water content of the desiccant material, $w$, is given by

$$\frac{\rho_{vd}}{\rho_d} = w$$  \hspace{1cm} (11)$$

$$\frac{dw}{dt} = \frac{h_m A_e}{\rho_d A_d L} (\omega - \omega_s)$$  \hspace{1cm} (12)$$

where $\rho_{vd}$ is the density of the water vapor of the desiccant, in kg m$^{-3}$

To have the equations according to the variables $\omega_s$, $T_s$, $\omega$, $T$, we start from:

$$dw = \frac{\partial w}{\partial \varphi} \frac{\partial \varphi}{\partial \omega_s} d\omega_s + \left( \frac{\partial w}{\partial \varphi} \frac{\partial \varphi}{\partial \omega} + \frac{\partial w}{\partial T_s} \right) dT_s$$  \hspace{1cm} (13)$$

or

$$dw = S_1(\omega_s , T_s) d\omega_s + S_2(\omega_s , T_s) dT_s$$  \hspace{1cm} (14)$$

$$S_1(\omega_s , T_s) = \frac{\partial w}{\partial \varphi} \frac{\partial \varphi}{\partial \omega_s} , \hspace{1cm} S_2(\omega_s , T_s) = \left( \frac{\partial w}{\partial \varphi} \frac{\partial \varphi}{\partial T_s} + \frac{\partial w}{\partial T_s} \right)$$  \hspace{1cm} (15)$$

Then the mass transfer equation for the desiccant layer becomes:

$$\frac{d\omega_s}{dt} = - \frac{S_2(\omega_s , T_s)}{S_1(\omega_s , T_s)} \frac{dT_s}{dt} + \frac{h_m A_e}{\rho_d A_d L S_1(\omega_s , T_s)} (\omega - \omega_s)$$

$$= - \frac{S_2(\omega_s , T_s)}{S_1(\omega_s , T_s)} \frac{dT_s}{dt} + \frac{C_4}{S_1(\omega_s , T_s)} (\omega - \omega_s)$$  \hspace{1cm} (16)$$
being,

\[ C_4 = \frac{h_m A_c}{\rho_d L A_d} \]  

(17)

\[ \frac{A_c}{A_d} = \frac{4D_h L}{(D_h + d_d)^2 - D_h^2} \]  

(18)

\[ h_m = \frac{h}{C_g L e} \]  

(19)

Le is the dimensionless Lewis number, which is generally assumed to be 1.

Heat transfer equation for the desiccant solid layer

The heat transfer to the desiccant is given by:

\[ \frac{d}{dt} \left( \rho_d A_d L C_d T_s \right) = q_{st} \rho_d A_d L \frac{d\omega}{dt} + h A_c (T_g - T_s) \]  

(20)

\[ C_d = \text{isobaric specific heat of the desiccant, J/kg K} \]

\[ q_{st} = \text{heat of adsorption, J/kg} \]

The eq. (20) can be written as:

\[ \frac{dT_s}{dt} = \frac{h_m A_c q_{st}}{\rho_d A_d L C_d} (\omega - \omega_s) + \frac{h A_c}{C_d \rho_d A_d L} (T_g - T_s) \]  

(21)

considering

\[ C_5 = \frac{q_{st}}{C_d} \quad \text{and} \quad C_0 = \frac{h A_c}{C_d \rho_d L A_d} \]  

(22)
Equation (21) is:

\[
\frac{dT_s}{dt} = C_4C_5(\omega - \omega_s) + C_6(T_g - T_s) \tag{23}
\]

Relative humidity and saturation pressure can be calculated by:

\[
\varphi = \frac{\omega_s P_0}{(0.622 + \omega_s)P_s} \tag{24}
\]

\[
P_s = 10^6 P_0 \exp\left(\frac{5294}{T_s} \right) \frac{(1 + 1.61\omega_s)}{(0.622 + \omega_s)} \tag{25}
\]

\(\omega\) = relative humidity
\(P_0\) = pressure, Pa
\(P_s\) = saturation pressure, Pa

2.3 SOLID DESICCANT COOLING CYCLES

The possible configurations and composition of each of the four components may vary according to the nature of the desiccant employed as described below.

2.3.1 Pennington cycle

Figure 2 represents the Pennington cycle scheme. The ambient air at point 1, which is the process air, passes through a desiccant wheel, where its moisture is removed and the temperature increases due to the effect of heat of adsorption. Then the hot, dry air is cooled from point 2 to point 3 in a sensible heat exchanger. It is then cooled by evaporation in a direct evaporative cooler.

On the regeneration air side, the return air at point 5 is cooled and humidified in another direct evaporative cooler and then passed through the heat exchanger where it receives sensible heat from the process air leaving at point 7. In this process, the heat source heat can be solar energy, fossil fuel, electrical energy or waste energy (DAOU; WANG; XIA, 2006).

The hot air stream is then heated between points 7 and 8. After regenerating the desiccant material in the desiccant wheel, the air is exhausted at point 9 (DAOU; WANG; XIA, 2006).
2.3.2 Recirculation cycle

The Recirculation Cycle is used to increase refrigeration capacity, and is a modified form of the Pennington cycle. It is designed to reuse the return air from the room as process air inlet in the desiccant wheel. Figure 3 illustrates this cycle. In the recirculation cycle, the return air is recirculated through the dehumidifier while the outside air is used for regeneration of the desiccant wheel (JAIN; DHAR; KAUSHIK, 1995).

2.3.3 Dunkle Cycle

The Dunkle Cycle combines the merits of the ventilation (Pennington) cycle and the recirculation cycle.

Figure 4 presents the scheme of this cycle (JAIN; DHAR; KAUSHIK, 1995). It has an additional sensible heat exchanger to improve cycle performance. This heat exchanger (points 5 and 6 and 2 and 3) can supply cooler process air. A large amount of ventilated fresh air that was supplied in the Pennington
cycle for air conditioning in addition to comfort and health also represents an additional cooling load. In some cases, it is not necessary for ambient air to be the process air source for the system.

The Dunkle cycle also employs 100% recirculation. In practice, this is not desirable. Ventilation (process) air can, however, be easily added to the return air. The Dunkle cycle performs better compared to the Pennington and Recirculation cycles in all climatic conditions (JAIN; DHAR; KAUSHIK, 1995).

2.3.4 Sens Cycle

LA et al. (2010) studied a cycle called the SENS cycle that uses solid desiccant. As shown in Figure 5, ambient air is first dehumidified in the desiccant wheel and then cooled by two sensitive heat exchangers that are connected. It is further cooled in a cooling coil, exchanging heat with cold water from a cooling tower and then mixed with a certain amount of return air from the room. Afterwards, the process air is divided into two parts, one part being redirected to the cooling tower and exhausted to the environment after heat exchange with process air in a sensible heat exchanger, and the other part supplied to the conditioned space.
2.3.5 Dynamic Cycle

Figure 6 shows the direct-indirect evaporative cooling (DINC) cycle in which little modification is made over the SENS cycle. The modification that occurs is the replacement of the sensible heat exchanger, the cooling tower and the cooling coil with an indirect evaporative cooler and a direct evaporative cooler to avoid complexity and simplify the system configuration (LA et al., 2010).

3 SYSTEMS THAT USE SOLAR ENERGY OR WASTE ENERGY AS A SOURCE OF REGENERATION HEAT

There are several types of desiccant air conditioning systems and their different installations that are available in the literature. This work presents the system that uses solar energy or waste energy as a source of regeneration heat.

The use of renewable heat sources such as solar thermal energy for the regeneration of solid desiccant dehumidifiers reduces electricity consumption as well as achieving substantial fossil energy...
savings. Solar heating is interesting when there is demand for cooling and, at the same time, great availability of solar energy ((JANI; MISHRA; SAHOO, 2016).

The functioning of the solar heating system includes solar collector, backup heater, storage tank, circulation pump and liquid-air heating coil. Solar collectors convert solar radiation into thermal energy in solar desiccant cooling systems. A backup heater is required for when solar energy is not sufficient, such as on cloudy and/or rainy days. Another important information is that the desiccant is regenerated by solar thermal energy produced by vacuum tube collectors (GAGLIANO et al., 2014).

Figure 7 - Solar-assisted hybrid solid desiccant vapor compression air conditioning system

Source: JANI; MISHRA; SAHOO, 2016.
Figure 8 shows the psychrometric representation of the solar-assisted solid desiccant vapor-compression hybrid air conditioning cycle graph. It is observed that the regeneration temperature required for the desiccant dehumidifier is comparatively low and can be efficiently maintained by the solar thermal collectors. There is no additional dehumidification needed to achieve the required humidity rate, as the ambient humidity rate of the outside air is comparatively low. There is no need to post-heat the supply air as the cooling coil operates at higher evaporator temperatures. The final temperature of the process air is adjusted according to the conditioned space requirement through the auxiliary cooling coil of the vapor compression cooler.

Figure 8 - Psychrometric graph of hybrid air conditioning cycle by solar-assisted solid desiccant vapor compression

Source: JANI; MISHRA; SAHOO, 2016.

4 CONCLUSIONS

This work presented the system that uses solar energy or waste energy as a source of regeneration heat and it was concluded that solid desiccant cooling is a very environment-friendly energy saving approach within this air conditioning system. Many researchers conducted their study using simulations and experimental methodologies aimed at improving energy efficiency and cost effectiveness.
This is a technology that, despite having been proposed many years ago, has only recently gained more space in research and applicability. Thermal energy is the main source of energy in a desiccant cooling system and can come from sources that are not harmful to the environment and with lower costs.

The use of solar energy that is freely available or waste heat from industrial processes that is used in the desiccant material regeneration process can make the system more cost-effective. Another benefit is that the use of solar energy helps alleviate the high peak demand for electricity caused by the conventional vapor compression air conditioning system.

ABSTRACT
The concern with the economic context and the need for metallic and non-metallic minerals in the current state of world globalization, has caused the abandonment of areas degraded by mineral exploration without any action for their recovery. The objective of this research was to analyze literature about the exploitation of mineral resources for various uses, as well as to seek an answer to the guiding question about the importance of the recovery of these areas after extraction. The method applied was a systematic review with quantitative and qualitative coverage. The data analyzed the occurrence of this type of extraction on a global level. In the Asian continent, China (coal for energy) and Indonesia (sand and gravel for construction) accelerate mineral exploration and this causing environmental impacts such as loss of soil fertility by AMD. In the African continent (Au extraction) in the open air and in an artisanal way, which determines the presence of mercury in water bodies. On the European continent, Poland, the chemical degradation due to the exploitation of iron and brown coal, is accentuated; on the South American continent, the exploitation of lithium in the Atacama Desert, of gold (in an artisanal way), bauxite, clay, sand, agate, iron, among others, present abandoned areas and without any type or proposal for their recovery, which is causing loss of endemic flora and fauna. Thus, it is affirmed that the economy and the advance of technology are not associated with the importance of maintaining the balance of natural ecosystems and do not evaluate, or do so in an incipient way, the importance of the recovery of areas degraded by mineral exploration.

Keywords: Alteration of environmental quality, loss of vegetation cover, decrease in soil functionality.
1 INTRODUCTION

In the process of searching for minerals that involve prospecting, mineral research, mining, and decommissioning of a mine, there is always vegetal suppression, soil disturbance, loss of habitat, interference in the climate, loss, or escape of invertebrate and vertebrate fauna is immense due to the modified biogeographical conditions in search of the economically viable mineral resource that in general, is great vertical depths, which causes modifications in the landscape and in the communities that inhabit the area where mineral exploration occurs, in addition to contamination or water pollution (Oliveira & Fontgalland, 2022; Pratiwi et al., 2021).

In countries whose mineral reserves are extensive, such as Brazil, their socioeconomic development, directly or indirectly, has the exploratory activities of natural resources to meet as its main support. In general, the need for foreign market inputs, where mining, can be highlighted as one of the main ways of using natural assets and enabling socioeconomic gains through the generation of employment and income.

One of the Brazilian federal states that presents this history is Minas Gerais, where iron (Fe), is explored in the municipality of São Gonçalo do Rio Abaixo, but it also occurs in the state of Pará, In Serra dos Carajás (Ferreira et al., 2018; Milanez, 2017).

In the national territory, mineral exploration uses the soil temporarily, because of this, this economic activity must find mechanisms that, when exhausting the explored mineral vein, can mitigate the damage caused and restore, at least in part, the ecosystem functions that that area exercised before as, for example, thermal regulation (Rosa, 2019) About the licensing for this potentially polluting activity, in 1940, the decree-law nº. 1.985 (Brasil, 1940), had new wording and, in article 2, five regimes for the use of the mineral resource: from concession to monopolization.

Twenty-seven years later, this code has new wording, now stipulated by the decree-law, no. After 19 years, this decree-law was altered by law 9.314 (Brasil 1996), with the same wording and the responsibility of the National Department of Mineral Production, the licensing regime. Until then, there is no mention of recovery of these areas, which only occurs in 1981 with the promulgation of the National Policy on the Environment (Brasil, 1981), based on Article 225, § 1, the item I, § 2 of the Federal Constitution of Brazil (Brasil, 1988).

In these last two legislations, describe that the objective of this recovery is to reestablish (?): The original triad as to the physical, chemical, and biological of the degraded area so that it obtains again the functional capacity it had before the mineral exploration. This requirement determines by Decree-Law No. 97.632 (Brasil, 1989), which requires mining enterprises, the composition of the Environmental Impact Studies, and the Environmental Impact Report (EIA/RIMA), to submit such documents to the responsible environmental agency (Barbosa et al., 2022).

But what is a degraded area? Conceptually, it is defined by Decree-Law No. 97.632/1989, as the result of damage that was caused to the environment and that determined the reduction or loss of natural properties such as productivity. Therefore, it is stated that human intervention, in this case, mineral
exploration, causes a severe environmental imbalance such as contamination and water pollution, which can even, compromise its very survival of it, since water is vital to life. In the case of mining, the cause-effect relationship is evident and, because of this, the actions that will allow the recovery of it must address numerous command and control instruments (Ex: PNMA, PNEA), in addition to the involvement of the community that remains at the site or the vicinity of the degraded site (Haren et al., 2019).

Therefore, the implementation of these activities in mineral resource exploration projects is aimed at protecting ecosystems and mineral resources, ensuring human well-being and health, reducing environmental problems, and developing the country's economic and social development sustainably. But the impacts they cause must be constantly studied and evaluated, which justified this research and increased its relevance, and allowed the elaboration of the objective, which was the search for the guiding question: Why is it important to reclaim areas degraded by mining

2 METHODOLOGY

This research employed the Systematic Review (SR) method, as summarized by Sousa et al. (2018). These authors state that the use of this type of review covers a large amount of information in a single study. As for the approach, two of them were used: quantitative and qualitative, according to what was described by Pereira et al. (2018). About the quantitative research, they wrote that one can use a metric scale, with or without units. Regarding qualitative, they stated that the researcher should use data more directly, while still being concerned with the product he wants, in this case, the academic literature. Then the five steps for this SR were applied (Chart 1).

To develop the guiding question, the "PICO strategy" used for nursing research was adapted: Patient; Intervention; Control, and Outcome. There were two adaptations: 1. The patient was adapted to
"Problem"; 2. The comparison was adapted to Control (Chart 2). This action is justified due to an elaboration with greater accuracy to the focus of this research.

Finally, the statistical analysis of the data obtained was conducted with the application of electronic spreadsheets contained in the Excel 2013 software, for the application of Descriptive Statistics, to calculate the values for absolute (fi) and relative (fr%) frequency, mean (\(\bar{x}\)) and standard deviation (\(\sigma\)).

3 RESULTS

3.1 LITERATURE SELECTION

3.1.1 Application of selective descriptors in isolation

Regarding the associated descriptors, it was verified the frequent use of these terms in the literature, especially focused on the last decade, indicates the importance and relevance of the theme today, both internationally and nationally (Table 1).

3.2 EXCLUSION AND INCLUSION PROCESS OF THE SELECTED LITERATURE

The data obtained and analyzed indicated that the international and national selection processes satisfied the guidelines established regarding the application of the selective descriptors (Figure 1).
3.3 DISTRIBUTION OF THE SELECTED LITERATURE ON THE TEMPORAL AND GEOGRAPHICAL SCALE

The data obtained regarding the distribution of the 31 selected publications, indicated that the most prolific period for international publications, occurred in 2019 and 2021, already in the triennium 2018-2019-2020, the publications of national research were more effective (Figure 2).
For the geographic distribution, the data analyzed indicated that the South American continent was the most prolific in the period analyzed (2017 - 2022). This may have occurred due to the natural resource reserves, especially in the Amazon (Figure 3).

![Figure 3. Continental geographic distribution of the selected literature in the pre-established period: 2017-2022.](image)

4 DISCUSSION

The concern with environmental degradation via mining is worldwide due to the occurrence of 21,060 exploration sites that total 57,272 km2 (Maus et al., 2020) and, among them, there are, in exploitation, coal (3,119 mines), gold (Au) 1,500 mines, and silver (Ag), 1,002 mines. This range of exploitation of natural resources (commodities) generates environmental degradation such as the disintegration of ecosystems, loss of soil fertility, pollution of surface and groundwater, and climate change. All these facts make the management of natural resources difficult (Rahmonov et al., 2022), as well as raising the cost of the degradation of impacted areas.

Despite this nefarious view, on the Asian continent, degraded areas are amenable to recovery, especially of ecosystem services, from vegetation re-covering. In Indonesia (Pratiwi et al., 2021), reforestation of degraded areas is a passive occurrence if, during coal mining, there is a control or use of the material of high capacity of absorption of acid mine drainage (AMD). This care is associated with the view that biological aspects should be considered, especially by the choice of plant species, which will by contributing to the decomposition of soil fertility and soil biota.

Two other natural resources exploited in this country, are sand and gravel (Putra & Purnaweni, 2018). They are useful for civil construction and have caused environmental problems in water resources since they are taken from the central channel of these water bodies. The legislation about this exploitation, as a tool and command and control, exists, but this does not prevent the clandestine exploitation of these resources and, consequently, there is loss, not only of water quality for public supply via wells, but also for...
agricultural use, and this shows that the degradation is not punctual but diffuse because there are losses of recreation areas, such as bathing.

Still on this continent, in Beijing, China (Han et al., 2021), the proposal to verify the ability to recover areas degraded by mining, was directed to the use of georeferencing images via Normalized Differential Vegetation Index (NDVI) from the comparison of historical series of images between 2000 and 2019, the loss and restoration of vegetation cover, which determined a qualification of the areas in Recoverable (R), Degraded (D), Degraded-Recovered (D-R) and no chance of recovery (NC). This fact called attention because there was no concern with the state of soil fertility, and the quality of the water after mining, although there are hydro climatological studies. However, there may be plant species that have adapted to the new lithological conditions, and whose nutritional capacity is low. In addition, faunal diversity may not return to the sites where the vegetation cover has regenerated, or the establishment of alien species may occur.

The concern for soil fertility in this country, in post-mining degraded areas, has not ceased to be the subject of study (Wang et al. 2021), since the Hongliulin coalfield in the Um Us Desert on the Loess Plateau is exploited as the primary source of energy used by the Chinese: coal, where ¼ of the area is already degraded. The nutritional loss of the soil is accentuated due to the sinking of the soil, loss in the capacity for infiltration and percolation of water, as well as deep cracks in the surface of the soil, and the loss of fertility in addition to its humidity.

On the African continent, in Kenya (Odumo et al., 2018), environmental degradation occurs in the face of Au mining, in an artisanal manner and with the use of Arsenic (As), in the districts of Migori and Transmara, since 1930, and since 2008, industrial mining has been initiated. There, the use of arsenic (As) is still used to separate the gold from the rock and, therefore, the effluent produced has heavy metals and metalloids in its composition, there is an accumulation of rocky and contaminated waste in the open air, and constant soil erosion. In the Limpopo Province in Zimbabwe (Mhlongo & Akintola, 2021), gold exploitation occurs in underground and surface mines, magnesite (surface mine), but copper only in underground mines. Most of them are abandoned after the exhaustion of the vein without any action for reclamation of the degraded area, and the rivers are highly concentrated in Ni, Zn, As, and Pb, which also occur in the soils around the abandoned areas. However, there are no reports of proposals for the partial or total recovery of the abandoned areas with environmental impacts, other than landscape restoration.

On the European continent, in Poland (Pusz et al., 2017), chemical degradation and erosive processes after iron ore (Fe) mining have been identified. In addition, loss of water quality, especially groundwater, by infiltration of MAD occurred due to the piling of mineral waste that in rainy season formed runoff channels, but in dry season serve as conduits for landslides of the accumulated soil where they found cadmium (Cd), Zn and Pb concentrations, in addition to ammonification and nitrification of the soil. No efforts for the recovery of these areas have been reported, nor whether they are still amenable to recovery, as vegetation is present in some areas of waste rock deposition, which may be iron canga vegetation.
In this country, in the village of Pita Mtyn (Rurek et al., 2022), the exploitation of hard and brown coal, which is an energy source, has modified the natural environment since it occurs at great depths, resulting in soil subsidence and generating an excessive volume of waste, but to reach such depths, the surface area also changes (e.g., removal of vegetation cover, soil disturbance to open tunnels that, when accumulated, can slide, disperse, and silt up water bodies, in addition to the loss of flora and fauna, both in the terrestrial and aquatic ecosystems.

As for the South American continent, the Peruvian Amazon, in the Madre de Deus district in the municipality of Cusco (Espejo et al., 2018), presents the same object of environmental degradation that occurs in Kenya: artisanal gold mining. In addition, there is an even greater environmental responsibility: this activity, in the Amazon, has already caused forest loss, and changes in the landscape, and, with this, the rate of fixation of residual forest carbon decreases, increases the content of soil and water contamination, via Hg, used in artisanal mining practiced in this region. In Chile (Liu et al., 2019), the exploitation of Lithium (Li), necessary for electric car batteries, contained in the salt present in the Atacama Desert, is already the object of mineral exploitation and a major cause of environmental degradative pressure. This country is responsible for 38% of the world's production of this mineral. In addition, the clean water used for extracting the brine Li is evaporated in plates, in the form of islands (Figure 4), which may threaten their use by both fauna and flora.

![Figure 4. Schematic of salt extraction in the Atacama Desert in Chile.](source)

In Brazil, mineral exploration is also effective. In the northeast region, in Fortaleza-CE (Garcia et al., 2017), manganese (Mn) is the focus of this action. The waste produced post-extraction, is numerous: high environmental toxicity, inhibition of plant growth, and changes in their communities. To mitigate these degradative effects, the application of phytoremediation via mycorrhizae and legumes of the species Mimosa caesalpiniaefolia Benth, Leguminosae family, is being developed.

In the South region, in the state of Rio Grande do Sul-RS (Silva et al., 2018), the exploitation is directed to Agate, applied in the production of jewelry and objects for ornamentation. The final evils of this exploitation are like the others, that is, deforestation, water and noise pollution, land subsidence, silting of rivers, impacts on the landscape, and, especially on flora and fauna. Another fact that shows similarity is
open-pit mining, as occurs in Kenya and Peru, with artisanal gold mining. So, environmental degradation is not dependent on the type of ore/mineral exploited, but on the techniques employed and the legislative responsibilities, before, during, and after this action.

Still in this region, in Florianópolis-SC (Corrêa et al., 2019) in the municipality of Icarai, clay exploitation occurs. The raw material needed for potteries, and ceramic tile factories. Like artisanal mining, this extraction occurs in the open sky and results in vegetal suppression, loss of fertile soil layer, vulnerability to soil erosion, imbalance of ecosystems, changes in the landscape, and environmental discomfort. In other words, open-pit mining is one of the major factors of environmental degradation on any continent of occurrence.

The Midwest region, concerning the mineral exploration, shows similarity with the Asian continent: in both occur the exploitation of gravel for construction. On the campus of the Federal University of Goias-GO, the use of gravel removed from the environment was directed to the internal paving of this area (Vilela et al., 2018). The revegetation of the degraded area after obtaining the gravel was done with the species *Genipa americana* L., Rubiaceae Family, and *Hymenaea stigoncarpa* Mart. ex Hayne, Fabaceae Family.

However, there is no data regarding the biology of the soil, and the arboreal, fruit-eating, and pedofauna fauna. In another municipality of this state, Crixás and Sun hat (Ribeiro et al., 2019), gold was exploited in an artisanal way (pumping of water jets and with the use of Hg and cyanide) and from the installation of the Serra Grande S/A mining company, in 1990, in Vermelho River, in a clandestine way, and this generated socio-environmental damage to the communities because they lost income, leisure, food, and contracted diseases that did not previously exist in the community: mental retardation, hydrocephalus, Down syndrome, and neurological problems, all proven by the Technological Center of Mining (CETEM).

Already Southeast Region, in Belo Horizonte-MG (Almeida et al., 2019), found that in areas degraded by Fe extraction, both native and exotic species can be used. However, it is necessary that the choice of vegetation is made according to the environmental state of the degraded area, especially regarding soil fertility, infiltration, and percolation capacity, to observe if there was the reception of the acid mine drainage. One should also keep in mind that the recovery of biodiversity is also necessary since it makes up the ecosystem and acts in seed dispersal and biological control of the site.

In the state of São Paulo, in the municipality of Salto do Pirapora-SP (Lima et al., 2020), limestone exploration, both for agriculture and construction, occurs in an ecotone area, whose residue is deposited on the soil forming a pile of so-called "sterile". It has no commercial value, but it has organic matter and, therefore, fertility, and plants grow on it. At this site, we identified species in transition, from the series or ecstasy stage to the climax stage, with the species *Leucaena leucocephala* (Lam.) de Wit., Fabaceae family, whose vernacular name is "lead tree", is the most adapted and frequent. However, once again, there was no description of the edaphic fauna, avifauna, and vertebrates, among others.

The Central Plateau, in Brasília-DF (Teran et al., 2020), is also the object of mineral exploration and the natural resource is like that exploited in Goias and Kenya: gravel. The difference lies in the fact
that this action occurs inside an Environmental Protection Area (APA) called Cafuringa, in the São Bartolomeu River basin. The post-exploitation degradation picture showed erosive processes, no vegetation cover, and soil with high phosphorus content (1.2mg/dm³; recommended = 10-15 mg kg⁻¹), which characterizes degraded soil.

In the northern region, in Belém-PA, municipality of Capitão Poço (Sauma Filho et al., 2021), pebble extraction occurs and, in this area, post-mining, recovery, and/or regeneration is not occurring for two reasons: 1. The removal of the fertile layer of soil; 2. The erosive processes are caused by mineral exploration. In the southeast of Pará state, in the municipality of Paragominas (Cerqueira et al., 2021), bauxite has been exploited since 2007, in the area called the "deforestation belt". The extraction method is strip mining, which requires the removal of the surface layer, therefore the layer with the highest concentration of organic matter (OC), but before this, it is necessary to promote vegetal suppression, thus altering the local landscape, with the escape of fauna, and therefore loss of biodiversity. To mitigate these problems, the mining company that operates at the site has adopted three techniques in its PRAD: direct planting, nucleation, and natural regeneration.

5 CONCLUSION

Regardless of the continent, country, state, or municipality, the extraction of metallic and non-metallic mineral resources, whether gold, silver, copper, clay, pebble, sand, or gravel, cause modifications to the landscape, flora, fauna, water resources, either by post-exploitation waste deposition or using chemical substances such as arsenic, mercury, and cyanide. In many places, mines exploited until the vein was exhausted, are not being recovered or regenerated, although there are already technologies, such as NDVI, that can be used to track the development of vegetation cover or revegetation in these areas.

It is significant to recover the areas after mineral extraction to restore the balance of ecosystems, and that there is a return of services provided by them, such as thermal regulation, and provisioning, among others. However, the analysis of these literatures still does not contemplate, with few exceptions, activities, and projects for the recovery of these areas and, when they exist, it is noted that there is no concern with the directives cited in the PNMA and the new Forest Code. Another importance is associated with the 17 sustainable development goals, especially the third, which deals with health and well-being, and the sixth, which deals with water potability. However, this item when related to mining and the non-recovery of the areas degraded by it, it must be considered that the use of fat-soluble metals and accumulators in the environment will act on the potability of the water and, therefore, will cause the appearance of diseases as it already occurs in the municipality of Crixás.

Thus, besides being important, the recovery of degraded areas must be a priority, not only at the legislative level, but also in the actions and inspections of the constituted powers and of the community in general, which feeds and uses the natural resources on a daily basis, without interfering in the international and national economic development, from the use of innovative technologies, whether for the maintenance,
regeneration, recompositing, restoration of the area that watered riches to others, but that continue to improve the communities living there.

The literature that was the object of this review showed that the research about the recovery of areas degraded by mining, whether of a metallic or non-metallic mineral resource, is the basis for further research to be developed, generating more data to support this activity and the recovery of the areas when the vein is depleted.

ABSTRACT
The research aims to investigate the socioeconomic consequences of the monocratic decision handed down by Minister Ricardo Lewandowski in the records of ADI 6363 during the state of public calamity, from the perspective of legal certainty. From the state of exception caused by Covid-19, the study aims to verify the (un)reasonableness of the monocratic decision when faced with the judgment of the precautionary measure by the Plenary of the Supreme Court. The methodology involved the study of the Federal Constitution and the federal legislation related to the subject, the Internal Regulations of the Federal Supreme Court, jurisprudence, addition to national and foreign doctrinal sources. The results bring reflections with the purpose of promoting the rational and univocal deliberation of the Supreme Court so that it is guided by consensus and not by the isolated dispute of which of the votes should prevail over the other. Likewise, it was concluded that the precautionary decision issued in a monocratic way in the records of ADI 6363 generated significant legal uncertainty for social actors while not being reformed by the Plenary of the Supreme Federal Court.

Keywords: plenary reservation, legal certainty, exception state.

1 INTRODUCTION

On March 11, 2020, the World Health Organization classified the new coronavirus (COVID-19) as a pandemic, highlighting its high risk of transmission, especially the reasonable mortality rate, which rises among elderly people and those with chronic diseases.¹

With this, the National Congress, through Legislative Decree No. 6 of 2020, approved the declaration of a state of public calamity due to the public health emergency of international importance related to the coronavirus (Covid-19). Thus, several preventive measures were adopted by the authorities, in all governmental spheres; the most important of which is to collect people at home, in order to avoid contact and the spread of the disease, as has been adopted in other countries.

Indeed, under the prism of law, in the concept of a pandemic, the restriction of some fundamental freedoms must be understood as a probable measure. This is because epidemiological surveillance comprises both isolation and quarantine as prescribed by art. 3, I and II of Law 13.979/2020. In addition, the aforementioned legislation authorizes the public power to impose on the citizen, within the scope of its

competence, among others, the compulsory performance of medical examinations and treatments, laboratory tests and clinical collections, restrictions on the right to come and go by means of closing highways, ports and airports, requisition of goods and services, as verified by the regulations created in the period.

In a recent monocratic decision (ADPF 672/DF), Minister Alexandre de Moraes granted full autonomy to States and Municipalities to regulate restrictive measures of rights through norms that do not necessarily need to be in step with the health planning of the Federal Government.

Nowadays, in the three spheres of the Federation, it is generally discussed that, in order to make the fight against pandemics effective, three pillars of the globalized economy must be restricted, namely: the free movement of goods, services and people. On the other hand, the result of the present pandemic is spreading in a context of economic crisis of quite significant proportions, and, as a result, the Federal Government has issued Decrees and normative acts in order to alleviate the perverse effects resulting from this exceptional situation, with the aim of also guaranteeing the subsistence of informal and unemployed workers, aiming to avoid mass layoffs.

It so happens that, to date, it appears that a large part of the legislation enacted during the state of calamity is having its constitutionality challenged before the STF. In spite of the fact that the country is going through a moment of exception, many of the monocratic decisions verified are not consistent with this true State of Exception, given that, instead of pacifying the conflict, there are Supreme Court decisions that are having the effect on the contrary, creating a situation of legal uncertainty, which will be the object of analysis of this work.

This is a discussion that should, of course, precede pandemics; the (un)reasonableness of the *modus decidendi* through monocratic decisions by Ministers of the Constitutional Court in actions of concentrated control of constitutionality, more precisely, direct actions of unconstitutionality, contrary to the dictates of an adequate and expected deliberation of the highest body of the Judiciary, as well as the revealing provisions of art. 10 of Law 9,868/99. The unreasonableness of these monocratic decisions would be confirmed from their reform by the plenary, a hypothesis that is intended to be confirmed or not.

The Brazilian State is going through an unusual social and economic crisis, caused by a pandemic that has already killed thousands of people; and all the powers that be, from all spheres of the federation, could, as part of federative harmony for the benefit of life, be, jointly and organized, making efforts to bring reasonable economic solutions in order to minimize the socio-economic impacts for the largest portion of the population.

This article aims to analyze the socioeconomic consequences of the monocratic decision of Minister Ricardo Lewandowski in the records of ADI 6363, issued as a precautionary measure during the exception.

---

2According to the United Nations, this expression includes situations designated by the following terms: state of emergency, state of siege, state of necessity, state of alert, state of prevention, state of internal war, suspension of guarantees, law martial arts, crisis powers, special powers, curfews, and all measures adopted by governments that subject the exercise of human rights to restrictions that go beyond those regularly authorized in ordinary situations (DESPOUY, 1997, p. 8).
state of public calamity under the prism of legal certainty. The methodology involved the study of the Federal Constitution and the federal legislation related to the subject, the Internal Regulations of the Federal Supreme Court, jurisprudence, in addition to national and foreign doctrinal sources.

The results bring reflections with the purpose of promoting the rational and univocal deliberation of the Supreme Court, so that it is guided by consensus and not by the isolated dispute between competing judges. In the same way, it was concluded that the precautionary decision rendered in a monocratic way in the records of ADI 6363 brought significant legal uncertainty in the face of the moment of exception through which the country passes.

2 A EXCEPTIONALITY CAUSED BY A PANDEMIC

In the national order, there is a differentiation between the system of normality, in which fundamental rights and guarantees impose limitations on political power in a broad and rationally concatenated way; and the system of abnormality, or of extraordinary legality, in which, in the face of crisis situations, represented by social, political, economic, ideological or similar unrest, they impose restrictions on certain fundamental rights or suspension of certain constitutional guarantees, in order to guarantee the activity of the state organization.³

The Federal Constitution has constitutional mechanisms for the defense of the State that are summarized as predisposed means to ensure the observance and, therefore, the conservation of a constitutional order (MORAES, 2003, p. 198). The instruments responsible for restoring institutional normality are the state of defense (art. 136 of the CF) and the state of siege (article 137 of the CF), which will not be the object of this study as they are outside the object that it is proposed to investigate.

Legislative Decree No. 6, of March 20, 2020, recognized, for the purposes of art. 65 of Complementary Law No. 101, of May 4, 2000, the occurrence of the state of public calamity throughout the national territory. With this, numerous health and economic measures are being taken by the Federal Government, States and Municipalities with the purpose of minimizing the damage caused by Covid-19.

In a democratic society, where political pluralism prevails, it is natural for opposition parties to contest normative acts issued by the Federal Government before the Constitutional Court. The political clash, including its judicialization, is fair and legitimate, even in the face of such an exceptional and abnormal moment, despite the legitimate expectation of the population to observe a union of forces, a combination of efforts in favor of the attacked public good (life of Brazilians), including all political segments, in order to minimize the loss of life of thousands of people and the socioeconomic damage created by the pandemic.

³Paul Leroy (1966, p. 34) mentions three different crisis situations that can affect the state organization in: (i) those triggered with the purpose of destroying the independence or territorial integrity of the State, (ii) those engendered to overthrow the political-institutional regime and (iii) economic-financial ones.
In times of exception, the ordinary rules are relaxed, certain rights, such as property, coming and going, the right to meet and others are relativized in favor of the right to life and the maintenance of public and economic order. The legal discipline becomes the target of adaptation to the moment and the state of exception starts to guide the decision-making of the heads of the Executive Powers of all layers of the Republic.

The exceptionality caused by a pandemic was not analyzed by Giorgio Agamben in his work “O Estado de Exception”, although some new lessons from the author can serve as a reflection for the current moment. It is not a question here of a void of law or a zone of anomie where all legal determinations are deactivated, quite the contrary, but of normative production meeting the socioeconomic needs of its people at this exceptional moment. Let's look at the social reality of Brazil. According to the newspaper “A Folha de São Paulo” unemployment increased in all regions of Brazil with the advance of Covid-19 and according to the IBGE, Brazil ended the first quarter of 2020 with 1.2 million more people, in the unemployment line. According to the website UOL, applications for unemployment insurance in Brazil increased by 22.1% in April compared to the same month last year, to 748,500, and the government estimates that there are up to 250,000 applications for the benefit held back in the year amid the difficulties imposed by social isolation because of the outbreak of the new coronavirus.

From these data, it is inferred that, despite the creation of programs to maintain jobs, through the edition of Provisional Measures (MPV) - 927 and 936 - as well as the availability of credit to micro and small entrepreneurs (MPV), 948) to subsidize the payment of the payroll of its employees; these measures have not yet been sufficient to contain the advance of unemployment. Likewise, the National Congress enacted Law 13,982 of April 2, 2020, instituting emergency aid in the amount of R$ 600.00 (six hundred reais) whose first installment, out of a total of three, has already been allocated to more than 50 million Brazilians.

With regard to Provisional Measures No. 927 and No. 936, both were issued considering the strong impact on the productive sector and on labor relations caused by the isolation and quarantine measures

---

4The state of exception is not a dictatorship (constitutional or unconstitutional, commissioner or sovereign), but an empty space of law, a zone of anomie in which all legal determinations — and, above all, the very distinction between public and private — are disabled. Therefore, all those doctrines that try to directly link the state of exception to the law are false, which happens with the theory of necessity as an original legal source, and with the one that sees in the state of exception the exercise of a right of the State to self-defense or the restoration of an original pleromatic state of law (the “full powers”). But equally fallacious are the doctrines that, like Schmitt’s, try to indirectly inscribe the state of exception in a legal context, basing it on the division between norms of law and norms of realization of the law, between constituent power and constituted power, between norm and decision. The state of necessity is not a “state of law”, but a space without law (even if it is not a state of nature, but presents itself as the anomie that results from the suspension of law). (AGAMBEN, 2015, p. 78/79)

5Emphasizing Agamben’s (2020b) criticism of the argument of a state of exception arising from the pandemic, in light of his positions on a supposed permanent state of exception, with the creation of fears to keep the submissive population under control.

necessary to contain the transmission of the virus and, consequently, to reduce in the number of cases of Covid-19 disease and possible deaths. Thus, the normative propositions were intended to mitigate damage to the economy and family subsistence, and could be adopted by employers to preserve workers' employment and income during this pandemic period.

As for the constitutional jurisdiction exercised by the constitutional courts, the issue is even more complex. These courts assume a greater role in the legal response to these demands not only because of the general repercussion, but also because of the binding effects and the persuasive force of precedents. The effect of its decisions on public and private accounts and on the promotion of universalizable rights is considerably wider. As a result, the analysis of this response needs to be more cautious.

It is then that the concept of crisis jurisprudence is completed. In a strict sense, the term refers to the set of precedents in which the Judiciary appreciates the constitutionality of austerity measures, while in a broad sense it contemplates the legal rearrangement necessary to respond to the demands that arise due to the critical reality. In this line, it would be comparable to a “negotiation process between the normative interpretation of the Constitution and the need to give in to the demands of circumstances” (PINHEIRO, 2014, p. 170).

It is precisely in the “requirements of the circumstances” that the pragmatic opening of judicial action to the context of a serious economic crisis is justified. It is not exactly about flexibilization, a pejorative term that suggests a certain propensity for concessions to the economic argument, but the need to adopt a more systematically coherent posture, concerned with the consequences (MAGALHAES, 2017, p. 12).

2.1 THE PLENARY RESERVE TO DECIDE ON PRECAUTIONARY MEASURE IN DIRECT ACTION OF UNCONSTITUTIONALITY

It is the exclusive competence of the Plenary of the Federal Supreme Court to take a precautionary measure in a direct action of unconstitutionality, which follows from the principle of plenary reservation, a rule that follows from art. 97 of the Constitution and art. 10 of Law 9,868/99 and is also expressly provided for in the Internal Regulations of the Federal Supreme Court (article 5, X).

Gilmar Ferreira Mendes and André Rufino do Vale (2011, p. 06)) teach that the submission to the plenary reservation of both the merit decision and the precautionary decision is based on the fact that both have direct effects on the applicability of the norms. As a result, the authors continue to add that, even in

9 Although Agamben (2020a) himself understands the exception measures adopted in the light of his much criticized understanding that the epidemic is serving as a pretext to create a state of collective panic, such as the use of the state of exception as a normal government paradigm.

10 The concept of André Ramos Tavares (2012, p. 266) is adopted by all, for whom constitutional jurisdiction designates “the union developed judicially with the Constitution as a parameter and, as appropriate, the behavior in general and, mainly, of the Public Power, contrary to that parametric norm”

11 This was the understanding signed by the STF in the judgment of RE 168.277.
cases of “exceptional urgency”, Law n. 9.868/99 reserves exclusively to the Plenary of the Court the competence to appreciate the precautionary measure.

It is important to emphasize that this same infra-constitutional legislation exempts the plenary reservation in the scope of the provisional provision, when in art. 10, caput, of Law 9.868/99, highlights the impossibility of meeting all members of the Court during recess periods.

With this, the Internal Regulations of the Federal Supreme Court (RISTF) grants the Minister President the authority to know and decide on urgent issues (art. 13, VIII), allowing him to consider requests for injunction in direct actions of unconstitutionality.

Indeed, even in the face of this exceptionality, the precautionary measure must be taken to the plenary referendum, through its Rapporteur, as soon as the recess or vacation period ends (art. 21, IV and V, RISTF). In exceptional circumstances, the Minister President himself may refer his decision to the plenary referendum, as occurred in the judgment of ADI 3.929-MCQO.

On the other hand, in some cases, waiting for the judgment of the plenary session following the request for a precautionary measure can cause the complete loss of utility of the jurisdictional provision. In this way, the ministers of the highest Court, making use of the general power of precaution, decide monocratically on the request for a precautionary measure in direct action, applying, analogically, § 1 of art. 5 of Law 9,882/99, referring to the claim of non-compliance with a fundamental precept, which allows for a monocratic precautionary decision “in cases of extreme urgency or danger of serious injury”. In these cases, it is essential to immediately submit, in the subsequent Plenary session, the precautionary decision to the referendum of the Court (art. 21, V, RISTF).

---

12“The decision on the precautionary measure is the responsibility of the Full Court and its granting depends on the vote of the absolute majority of its members, after hearing, in advance, the 'organs or authorities from which the law emanated' (Law 9.868/99, art. 10) The law makes a single exception to the rule: 'Except during the recess period' (Law 9.868/99, art. 10). At no time, except for the recess, does the law authorize a precautionary decision by the rapporteur. 'exceptional urgency', the law maintains the competence of the decision with the Court. It authorizes that such a decision can be taken 'without the hearing of the bodies or authorities from which the law emanated...' (Law 9.868/99, art. 10, § 3). The law also allows the Court to remove the general rule from the ex nunc effect of the injunction and grant it with 'retroactive effectiveness' (Law 9.868/99, art. 11, § 1). With this last rule the legal treatment of exceptionality is completed. At no time, ‘except during the recess period’, is it possible to make a monocratic decision. (...) The orient is peaceful. action of the Court in the sense that the periculum in mora is not configured, for the purposes of granting a precautionary measure, if the law object of the challenge has been in force for a long time.” (MS 25.024-MC, rel. min. Eros Grau, monocratic decision handed down by President Min. Nelson Jobim, judgment on 8/17/2004, DJ on 8/23/2004.)

13(...) although Law 9,868/99 only mentions the word “recess”, it also applies to the Court's “vacation” periods. (MENDES, DO VALE, 2011, p. 09)

14Question of order. Direct action of unconstitutionality. Request for a precautionary measure. Grant, by the presidency, during the court's forensic vacation period. Articles 10, caput, of Law 9,868/99, and 13, VIII, of the RISTF. Reporting of the plenary referendum attributed to the President herself, due to the exceptional nature of the specific case. Possibility. The heading of art. 10 of Law 9,868/99 authorizes, during periods of recess of the Court, the exceptional monocratic granting of the precautionary measure in direct action of unconstitutionality. By imposition of article 21, items IV and V, of the Internal Regulations, preliminary decisions granted by the Presidency in these circumstances are then submitted to a referendum by the Collegiate, normally after the distribution of the records of the direct action to a certain supervening rapporteur. Present peculiarities that recommend the exposition of the case by the body responsible for the decision brought to the referendum of the Plenary of the Federal Supreme Court. Issue of order resolved in order to authorize the Presidency, exceptionally, to report the referendum of the monocratic injunction rendered in the records of the present direct action.” (ADI 3.929-MC-QO, Rapporteur Min. Ellen Gracie, judgment on 8/29/07, DJ of 10/11/07).
In the same sense, in case of exceptional urgency, the Court may grant the precautionary measure without hearing the bodies or authorities from which the law or the contested normative act emanated (art. 10, §3 of Law 9,868/99).

As a general rule, art. 11, §1, of Law 9,868/99, provides for the possibility of granting the precautionary measure with ex tunc effects, suspending the effects of the questioned rule since its publication, as a mechanism to avoid the loss of law and ensure the future definitive pronouncement of the Court, since it is necessary to recognize that the hypotheses presented above are extremely exceptional.

Furthermore, the hermeneutic technique of modulation of effects is an effective instrument to ensure compliance with the decision on the merits in the direct action of unconstitutionality and, with this, it fulminates, in most cases, the need for urgent monocratic decision by the reporting minister. The normalization of the exceptional situation of monocratic decision leaves the STF in the shadow of its individual members, which does not prove to be adequate as a technique of deliberation or as an idea of a collegiate institution, as advocated by Conrado Hübner (2012, p. 13-14).

During the state of calamity, a monocratic decision sharpened the debates in the most diverse segments of society: it is the decision given by Minister Ricardo Lewandowski in the records of MC ADI 6363.

Even before submitting to the plenary, Minister Ricardo Lewandowski partially granted the precautionary measure in ADI 6363 to establish that individual agreements to reduce working hours and wages or temporary suspension of the employment contract provided for in MP 936/2020 only they would be valid if the workers’ unions were notified within 10 days and expressed their opinion on its validity. According to the decision, the union’s non-expression, in the form and within the deadlines established in labor legislation, would represent consent to the individual agreement.

Thus, the next chapter intends to verify whether during the state of calamity it would be reasonable for the Supreme Court minister to decide in a monocratic way, a sensitive issue that had and still has repercussions in the social and economic sphere of millions of people and the State.

2.2 THE CONCRETE CASE – ANALYSIS OF THE MONOCRATIC DECISION – CRITICISM AND SOCIOECONOMIC REFLECTIONS

The Rede Sustentabilidade party filed ADI 6363 before the STF against normative texts of MP 936/2020, which established the Emergency Employment and Income Maintenance Program, introducing complementary labor measures to face the state of public calamity resulting from the new coronavirus pandemic. The party, on a precautionary basis, intended to suspend rules that authorized the reduction of wages and the suspension of employment contracts by means of the individual agreement signed, without the intervention of the class union, between employee and employer.

MP 936/2020 (now converted into Law n. 14.020/2020) allows the proportional reduction of working hours and wages and the temporary suspension of the employment contract, including through
individual agreement, for employees with a salary equal to or less than R$ 3,135.00 (three thousand, one hundred and thirty-five reais). Likewise, it allows the same measures for holders of higher education diplomas who receive a monthly salary equal to or greater than twice the benefit ceiling of the General Social Security System (RGPS).

The Sustainability Network argued that the reduction of remuneration would only be possible through collective bargaining and with the purpose of guaranteeing the maintenance of jobs. He also argued that, even if individual negotiation were admitted for higher-income workers, this hypothesis would be unfeasible when dealing with the most vulnerable, who form the largest part of the productive workforce.

According to the political party, the normative act attacked affronted the constitutional principle of protection, which gives security to employees, the most vulnerable part of the labor relationship. Wage irreducibility is a constitutional guarantee intrinsically linked to the principles of human dignity and the social value of work and therefore could never be made more flexible through individual agreement.

Finally, the party argued that the provisions of the MP violated Conventions 98 and 154 of the International Labor Organization (ILO), which deal with collective bargaining. It is important to make it clear that this article does not have the power to analyze the legal grounds that led the party to request that the provisions of MP 936/2020 were declared unconstitutional.

In this context, in spite of the fact that the Attorney General’s Office (AGU) handled the relevant motions for clarification against the monocratic decision rendered, we will not comment on the consequent decision since it is not of interest to the purpose of the research.

The rapporteur of the ADI, Minister Ricardo Lewandowski, delivered a monocratic decision ad referendum of the plenary, understanding that due to the distribution of the action of concentrated control of constitutionality it has taken place on April 2 of this year, with the MP attacked coming into force the day before, such facts, by themselves, would demonstrate the urgency in delivering the judicial service.

Under normal conditions of temperature and pressure, outside the state of public calamity caused by the new coronavirus, it is understood as less unreasonable the conduct of the rapporteur minister, making use of the general power of caution, to decide monocratically on the request for a precautionary measure in the action of abstract control of constitutionality, applying, analogously, § 1 of art. 5 of Law 9,882/99, referring to the claim of non-compliance with a fundamental precept, which allows for a monocratic precautionary decision “in cases of extreme urgency or danger of serious injury”.

It could also adopt the rite provided for in art. 10, §3 of Law No. 9,868/99, at which time, after submitting the precautionary measure to the plenary, the collegiate could grant or not the precautionary measure without hearing the bodies or authorities from which the law or the contested normative act emanated.
Presented, even in a succinct way, the normative act contested by means of ADI 6363, the research will be carried out from the perspective of legal certainty\(^\text{15}\), if the monocratic decision in the injunction issued during the state of public calamity brought or not legal certainty.\(^\text{16}\)

Well then. The precautionary decision granted by Minister Ricardo Lewandowiski in the records of ADI 6363 caused public opinion\(^\text{17}\) and the STF website itself\(^\text{18}\) to convey the information that the agreements would only be valid upon acceptance by the union entity.

From this decision, companies should inform the union of employees of their respective category about individual agreements to reduce working hours and wages or temporary suspension of employment contracts, within a period of up to ten calendar days, counted from the date of your celebration. With this, within this period, the unions could initiate a collective negotiation to discuss the terms of the agreement. On the other hand, in the case of inertia and the term has expired, the contracts would be valid.

The main effect of the monocratic decision was the legal uncertainty created at the expense of the need to submit to the unions all individual agreements object of MP 936/2020, since the Federal Government accounted for almost 8,000 (eight thousand) individual agreements to reduce working hours and wages. Or suspension of the employment contract from the moment MP 936/2020 was published until the date of the monocratic decision, agreements that ran the risk of not being effective after the injunction of Minister Lewandowiski\(^\text{19}\).

However, by majority vote, in a judgment held on April 17, the preliminary injunction was revoked by the STF Plenary, which decided to maintain the full effectiveness of MP 936/2020, authorizing the reduction of working hours and salary or suspension. Of the employment contract, through individual agreements, with the mere communication to the Union, regardless of its consent.

In this plenary session, the ministers: Alexandre de Moraes, Luís Roberto Barroso, Luiz Fux, Carmen Lúcia, Marco Aurélio Mello, Gilmar Mendes and Dias Toffoli voted for the effectiveness of individual agreements.

The understanding prevailed that, due to the exceptional moment, the prediction of individual agreement is reasonable, as it guarantees a minimum income to the worker and preserves the employment relationship, beyond the period of the crisis. Thus, according to Minister Alexandre de Moraes, the requirement for union action, opening collective bargaining or not manifesting itself within the legal

---

\(^{15}\)Gustav Radbruch (1979, p. 417) praises legal certainty as one of the three purposes of law. The other two would be justice and the common good.

\(^{16}\)The decision of the STF that declares the unconstitutionality of a normative act is definitive: here the Court, in fact, has the last word and its command must be obeyed without recalcitrance. In fact, in lawsuits in general, it is really essential that there is a last word ending the dispute, otherwise one of the essential purposes of the process, which is to definitively resolve intersubjective conflicts, bringing legal security and social pacification (SOUZA NETO ; SARMENTO, 2014, p. 408).

deadline, would generate legal uncertainty and increase the risk of unemployment. For the Minister, given the exceptionality and temporal limitation, the rule is in line with the constitutional protection of the dignity of work and the maintenance of employment.

Therefore, at the end of the judgment of the precautionary measure, the wording of MP 936/20 prevailed, recognizing and validating the individual agreements on salary reduction and suspension of contracts are valid, without conditioning them to the manifestation of the unions, but only demanding the its communication to the unions, within 10 days. Finally, it is necessary to register that the decision refers only to MC ADI 6363, and the merits will still be submitted to a later judgment, by the plenary of the STF.

3 THE ADEQUATE DELIBERATION

It is not new that part of the doctrine, as well as Justices 20 of the Supreme Court, vehemently criticize the appreciation of precautionary measure in a monocratic way, contrary to the provisions of Law 9.868/99 and the Internal Regulations of the STF. In this context, Lênio Streck (2019, p. 323):

It is necessary to recognize the existence of a fundamental right of citizens to comply with arts. 10 of Law 9,868/1999 and 97 of the Federal Constitution. In conclusion, therefore, that the monocratic granting of the precautionary measure cannot be used to replace the decision in full bench mode, therefore, it must be used only in cases of recess or vacation, and must be immediately taken to the plenary for a referendum.

In fact, the principle of plenary reservation and the federal legislation that regulates the matter have been, habitually, disrespected by the ministers of the STF. As a logical consequence, the provisions of art. 21, IV and V of RISTF.

---

20Law No. 9,868, of 11.10.99, providing for the precautionary measure in an action of unconstitutionality, establishes, in art. 10: 'Art. 10. Except in the recess period, the precautionary measure in the direct action will be granted by decision of the absolute majority of the members of the Court, observing the provisions of art. 22, after the hearing of the bodies or authorities from which the contested law or normative act emanated, who must pronounce themselves within five days.' In § 1 of the aforementioned art. 10, the rapporteur is entitled to hear the Attorney General of the Union and the Attorney General of the Republic, within three days. In paragraph 2, in the judgment of the request for the injunction, oral support is granted to the parties. the art. 10, transcribed above, orders the observation, in the judgment of the precautionary measure, of article 22, saying that the decision will only be taken if at least eight ministers are present at the session. The law, as it turns out, surrounds the judgment of the injunction with various formalities, or requires, for the taking of the decision, the existence of several requirements: vote of the absolute majority of the members of the Court, special quorum for the opening of the session, allowing to the parties oral support. I think, therefore, that the President of the Court, in recess, competent to dispatch the request for injunction, should only do so in case of actual need, that is, in the event of the possibility of the loss of law. Another issue arises: the Internal Regulations of the Federal Supreme Court distinguishes vacation from recess periods. Establishes art. 13, VIII, which are the duties of the President to decide, during recess or vacation periods, request for a precautionary measure. And more: the art. 78 of the aforementioned Internal Regulation provides that 'the judicial year at the Court is divided into two periods, with vacations falling in January and July.' Paragraph 1 of the aforementioned art. 78 defines recess: 'Forensic holidays between December 20 and January 1, inclusive, constitute recess.' Paragraph 2 adds that, 'Without prejudice to the provisions of item VIII of art. 13, the work of the Court is suspended during recess and vacations, [...]’ And § 3 again refers to recess and vacations: ‘The Ministers will indicate their address for possible summons during vacations or recess. ’Now, Law 9,868, of 11.10.99, only saves the recess period, by prescribing, as we have seen, that, 'Except during the recess period...’ That is to say, Law 9,868, of 1999, art. 10, only allows the granting of the precautionary measure, by the President of the Court, during the recess period of the Court. I admit that, during the vacation, in direct action, the possibility of the loss of the right, it will be lawful for the president to dispatch the request and grant it, if applicable. Apart from that, however, it does not seem possible to me, taking into account art. 10 of Law 9,868/99 and the regimental provisions indicated, which distinguish the recess period from the vacation period. From the above, I determine the forwarding of these records to distribution, in due course.” (ADI 2244/DF).
In this sense, there is a precautionary decision in the records of ADI 4.917/DF 21, issued in 2013 by Minister Carmem Lúcia, outside of recess or vacation periods, which until now had not been ratified, and there was not even agenda for judgment 22.

Nowadays, during the state of public calamity, numerous monocratic decisions suspended the validity of law or normative act, among them we quote MP 936/2020, whose content we have already discussed, in brief. Another monocratic decision handed down by Minister Alexandre de Moraes, in this case, at the headquarters of MS nº 37.097, suspended the appointment of the director general of the Federal Police, Alexandre Ramagem.

Mention is made of this decision, despite not having been the object of abstract control of constitutionality, just to illustrate the legal and social relevance of a monocratic decision of the Constitutional Court.

In fact, Justice Marco Aurélio, already in the month of May, submitted to the Minister President, Dias Toffoli, a letter proposing the alteration of the Internal Regulations of the STF. The aforementioned instrument consists of a proposal for the plenary of the Court to be responsible for decisions involving acts of the Legislative and Executive powers. Thus, the magistrate proposed that issues of this nature not be judged individually by each of the 11 (eleven) ministers. In the minister’s understanding, the amendment is necessary to "preserve the harmony recommended constitutionally" between the Powers:

In the scenario, it is possible to have perplexity, reaching the individual performance of a unique scale. In this context, there is, so far, the possibility of examining the act of one of the Powers, as Power. So, with the Judiciary having the last word, one of the members of the Supreme Court, alone, can remove, from the legal world, an act practiced by a leader of another Power - Executive or Legislative.23

He also considered that “efforts must be made aiming, as much as possible, to preserve the harmony recommended by the Constitution, emerging, in any case, with great value, the principle of self-restraint”. A proposition like this demonstrates that, among the peers themselves, there are reservations about the limits of the monocratic decisions of the members of the STF.

To aim for harmony, the firm values of a modernity yet to be implemented, to the detriment of constant impulsive values, which translate and produce fear and panic in liquid modernity (BAUMAN, 2007) is an insurmountable condition for our Constitutional Court to provide a society of objective common, with achievements of a true, comprehensive and lasting nation.

21 The substantive issue is of paramount importance, as it involves the (un)constitionality of normative provisions of the Royalties Law (Law 12,734/2012), affecting the so fragile national federative balance and possible maladjustment of the financial regime of the federated entities.
22(...) this MC should have been taken to the Plenary right away, which would only mean a few days. In fact, this Precautionary Measure, as it was granted in a normal period (not recess), could not even have been granted, because the only exception to the granting of a Precautionary Measure in ADI is that the court is in a recess period. Available at: [http://www.conjur.com.br/2014-dez-04/senso-incomum-decisao-ministra-stf-valer-medida-provisoria ]. Accessed: 01 Jul 2020.
It is necessary for the STF to address its own members in the construction and adequate conviction of the grounds that support that decision. Looking only at the external public that watches as a spectator, as an audience of a spectacle of the Republic does not prove to be conducive in this area of immense legal uncertainty in which we live. Otherwise, we will be facing a “court of soloists”, with competing judges, who only aim to win individually, for the audience, with their arguments made available to social media.

Temperamentally, he refuses to speak in the first person plural. From a deliberative perspective, it continues to be a peripheral and inexpressive entity. Transforming a court of soloists into a deliberative court requires more than procedural rearrangements. It requires judges, personally, to understand and value the spirit of deliberation. That they finally become deliberators (MENDES, 2012, p. 20).

It is very important to promote a formal and collective environment in essence of the STF, which should jointly and reasonably build the solution to social and legal problems that are already problematic and conflicting to the extreme by their very nature, especially at this time of exceptional measures in a situation of a global pandemic, not deserving greater incentives for individualistic conduct, disaggregation and social animosity by its judges (MENDES, 2018).

The harmony and cohesion of the STF must be the rule in this Constitutional Court, and there cannot be a preponderance of individuality and persuasion paths of the virtual auditorium in this scenario of “judicial shows” transmitted “online” and live.

In comparative law, especially in France, in the light of Millns' research, including field research through individual interviews with judges of the Constitutional Court and the Council of State of France, seeking to understand the perspectives and motivations in the elaboration of decisions of the members of the French Courts, there was a high degree of consensus and satisfaction with the process of drafting the judicial decisions of that body. Even noting that, in the view of those judges, the mere exposition of the dissenting vote seen as a demonstration of lack of cohesion and uncertainty in the decision, which undermines the credibility of the institution (let alone the individual decision to the detriment of the decision of the entire collegiate).

The discussions covered a broad range of issues concerning the decision-making function of the Constitutional Council, its style of judicial reasoning, the composition of the body, divisions of opinion amongst members, the distribution of case load, the drafting of decisions and the rationale for not allowing the publication of dissenting opinions. The results of the interviews, somewhat disappointingly (but perhaps not surprisingly given the political, judicial and academic background of the members of the Council), revealed an enormous degree of consensus and satisfaction with the decision-making process. Members repeatedly stressed the importance of the Council giving, and being seen to give, a single, clear and unambiguous response to highly important constitutional questions. In particular, none of the interviewees favored the introduction of dissenting judgments believing they would demonstrate a lack of cohesion and degree of uncertainty in the decision which might then undermine the credibility of the institution. (MILLNS, 2004, p. 12).

24 As this judge became a co-participant in the creation of Law, the legitimation of his decision will pass to legal arguments, to his ability to demonstrate the rationality, justice and constitutional adequacy of the solution he built. From this perspective, the interesting concept of auditorium emerges. The legitimacy of the decision will depend on the ability of the interpreter to convince the audience he is addressing that this is the correct and fair solution. (BARROSO, 2015, p. 32)
The logic of deliberation, by Kornhauser and Sager (1993, p. 13), in order to build the judicial decision in Constitutional Courts, reveals itself as a task that involves commitment, demanding a deliberation of the entire collegiate, a plural action of the members of the Court as an entity, and not a singular and individualistic vision of its parts.

The legal uncertainty brought about by a singular precautionary decision, of a constitutional nature, with relevant social and economic effects, at this time of a pandemic, translates or reveals the absence of an opinion of the Court, appearing to be an inadequate form of action or technique of decision of the *seriatim decisium* in a non-dialogical way, as well demonstrated by Mendes (2017, p. 147).

The idea of strengthening collegiality, of submitting very relevant issues of our society to the understanding of the plenary of the STF, reveals itself as a winning argument, in the face of an inadequate vision of 11 (eleven) supremes, in which there is a permanent dispute harmful to every society of judges, in a sense of individual victory or defeat of these judges (HOFFMANN-RIEM, WOLFGANG, 2006). In this sense, Virgílio Afonso da Silva's view that our Supreme Court is a “non-cooperative and individualistic” Court (2013, p. 578) is correct.  

In this way, the importance of a change in the democratic deliberative posture of our Constitutional Court is revealed, as the only way to face an extremely critical and dubious society of the acts of the constituted powers. We conclude that it is extremely relevant that our Supreme Court ordinarily functions in a calm, harmonious way and with due deliberation collegiate by the few judges who “say the law” in the final analysis, building the true *ratio decidendi* of the Court and not of the minister. The communicative action of ministers must be guided by non-instrumental behaviors, as recommended by Habermas:

> We can say, in summary, that the actions regulated by norms, the expressive self-representations and the manifestations or evaluative emissions come to complete the acts of constative speech to configure a communicative practice that, against the backdrop of a world of life, tends to achievement, maintenance and renewal of a consensus that rests on the intersubjective recognition of validity claims susceptible of criticism. The rationality immanent in this practice is manifested in the fact that the agreement reached communicatively must ultimately be based on reasons and the rationality of those who participate in this communicative practice is measured by their ability to base their manifestations or emissions in the appropriate circumstances (HABERMAS, 1992, p. 36).

The ministers of the STF must act in such a way as to build, together, as a body, an institutional position, deliberating in a rational and efficient manner, in order to reach a majority conclusion on the reasons for deciding, on the unique motivation that externalizes the institutional position of the STF. Supreme Court in its relationship with society, leaving the individual decisions and positions of its judges to very exceptional and brief situations, in order to facilitate the construction of a consensus through a non-

---

25Free translation of the aforementioned passage, which, in literal terms, we reproduce: “The Brazilian Supreme Court is an extremely uncooperative and individualistic court.”

26(...) the lack of communication among justices, and the fact that an “opinion of the court” must not be delivered, have two further side-effects: the complete exclusion of defeated justices from discussing the justification for the final decision, and the difficulty (in some cases, the impossibility) of identifying the ratio decidendi of a given decision (DA SILVA, 2013, p. 576).
instrumental relationship, whether between the members of this collegiate body, or in relation to the entire Brazilian society.

The monocratic decision made by the rapporteur is isolated, without the participation of his peers in the Supreme Court. In Celso Lafer's analysis of the dignity of politics in Hannah Arendt (LAFER, 2018, p. 129) there is an important distinction between politics and “certain forms of knowledge”. Politics implies the exercise of what is called plural thinking, which is the ability to “think about the place and position of others”, where word and action allow the emergence of “freedom”. It differs from the monologic discursive structure (FERRAZ JR., 70), which is more centered on the person and on the coherence of his decision with his internal convictions, even if backed and grounded. The problem is that “the State is not a product of thought, but of action”, which comes into existence substantively with the free and collective exercise of judgment by all the members of our Supreme Court.

4 CONCLUSION

The Brazilian State is experiencing its greatest social-economic crisis caused by a global pandemic that has already killed thousands of people, and all the constituted powers, from all spheres of the federation, should be, jointly and organized, making efforts to bring economic solutions, reasonable in order to minimize the socio-economic impacts for the largest portion of the population.

In moments like this, the ordinary rules are relaxed, certain rights, such as property, coming and going, the right to meet and others are relativized in favor of the right to life and the maintenance of public and economic order. The legal discipline becomes the target of adaptation to the moment and the state of exception starts to guide the decision-making of the heads of the Executive Powers of all layers of the Republic.

In the present research, it was found that provisional measures enacted during the state of calamity had their constitutionality challenged before the STF. It was also found that, despite the fact that the country is going through a moment of exception, many of the monocratic decisions, it seems, are not weighing this true State of Exception, given that, instead of pacifying the conflict, some Supreme Court decisions are having the opposite effect, creating legal uncertainty.

This is what happened in the specific case object of this study. As demonstrated elsewhere, the injunction granted by Minister Ricardo Lewandowiski in the records of ADI 6363 caused public opinion and the STF's website to convey the information that the agreements between employees and employers would only be valid upon acceptance by the trade union entity.

The main effect of the monocratic decision was the legal uncertainty created at the expense of the need to submit to the unions all individual agreements object of MP 936/2020, since the Federal Government accounted for almost 8,000 (eight thousand) individual agreements to reduce working hours and wages. or suspension of the employment contract from the moment MP 936/2020 was published until
the date of the monocratic decision, agreements that ran the risk of not being effective after the precautionary decision of Minister Lewandowski.

However, by a majority of votes, the preliminary injunction was revoked by the Plenary of the STF, which decided to maintain the full effectiveness of MP 936/2020, authorizing the reduction of the working day and salary or the temporary suspension of the employment contract, for through individual agreements, with mere communication to the Union, regardless of its consent.

The understanding prevailed that, due to the exceptional moment, the prediction of individual agreement is reasonable, as it guarantees a minimum income to the worker and preserves the employment relationship, beyond the period of the crisis. Thus, according to Minister Alexandre de Moraes, the requirement for union action, opening collective bargaining or not manifesting itself within the legal deadline, would generate legal uncertainty and increase the risk of unemployment. For the Minister, given the exceptionality and temporal limitation, the rule is in line with the constitutional protection of the dignity of work and the maintenance of employment. Thus, the hypothesis of the present work was confirmed.

Indeed, it is necessary to recognize the existence of a fundamental right of citizens to comply with art. 10 of Law 9.868/1999 and art. 97 of the Federal Constitution in the light of an adequate and reasonable theory of judicial decision, through sufficient deliberation. In conclusion, therefore, that the monocratic granting of the precautionary measure cannot be used to replace the decision in the full bench mode, therefore, it must be used only in cases of recess or vacation, and must be immediately taken to the plenary for a referendum.

It is concluded that preliminary injunctions decided in a monocratic way are, as a rule, not adequate in view of the provision of Law n. 9.868/99 (art. 10) and art. 97 of the Constitution. Extremely exceptional cases should be well defined and defined in the Court's Internal Rules. The current situation requires it and, therefore, it is necessary to regulate the use of the general power of caution by the Rapporteur in the actions of abstract control of constitutionality.

Stimulate a formal and collective environment in essence of the STF, which should jointly and reasonably build the solution to social and legal problems that are already problematic and conflicting to the extreme by their very nature, especially at this time of exceptional measures in a pandemic situation, not deserving greater incentives for individualistic conduct, generating legal uncertainty, disintegration and social animosity.

Thus, the importance of a change in the deliberative posture of the STF is revealed, as the only way to face a plural society, extremely critical and dubious of the acts of the constituted powers.

A harmonious Supreme Court is fundamental for the construction of Law in Brazil, with decisions built through adequate and sufficient collegiate deliberation, thus building the true ratio decidendi of the Court, and not an individual, discursive monological thought.

ABSTRACT
This work reports the development of an electronic device to be applied in an urban traffic light system, capable of showing relevant information such as the remaining time of the signal and additional information from sensor data to control traffic, sharing information useful to drivers and pedestrians. Studies were carried out on the topic of smart traffic management, new strategies under development and improvement in recent years of research, and the consequences of traffic on urban roads, to propose the principle and parameters of the device’s operation, based on the system’s efficiency. Through studies, it was noted that the traditional traffic light system has its limitations, such as excessive expenses with light bulbs, and problems with electrical failures, in addition to the fact that congestion increases the emission of polluting gases and harms the health of drivers and pedestrians. In this sense, there is the possibility that an RGB LED panel controller offers useful and clear information, received by a device via UART communication so that it is possible to obtain a lower rate of traffic congestion. Soon, a micro-controlled LED panel management system will be developed to replace traditional traffic lights and focus groups.

Keywords: Semaphore, RGB LED, Smart traffic management.

1 INTRODUCTION
1.1 THE TECHNIQUE STATE DESCRIPTION

In order to propose an electronic device with a low financial cost, in previous works, the authors Oliveira et al. developed a traffic light controller hardware with wireless communication. Controller hardware is understood to be an electronic circuit capable of activating and reading the status of all its lamps (with AC/DC power), having an input for the pedestrian priority button, and communicating via a wireless network. wire through a radio frequency (RF) module. Both the high-level architecture and the electronics board can be seen in Figure 1.
Figure 1 – The used traffic light system's high-level architecture (left image) and electronic board (right image).

The complete description of all the building blocks of the high-level architecture of the traffic light electronic circuit in Figure 1 can be found in (OLIVEIRA; MANERA; LUZ, 2019). The traffic light controller can trigger a Vehicular Focus Group (GFV) - composed of red, yellow, and green lights for vehicles - and a Pedestrian Focus Group (GFP) - composed of red and green signaling lights for pedestrians.

The communication protocols ZigBee, Z-Wave, MiWi, Bluetooth, 6LoWPAN, and 802.15.4 are some of the most used protocols in Wireless Sensor Networks (WSN). However, although there are already several technological applications using such protocols, there are still significant improvements to be explored, such as routing table algorithms, reduction of average energy expenditure, reduction of latency between network nodes, increase in bandwidth, increase in area coverage, an increase of nodes in the network (STOJIMENOVIC, 2005).

The present work makes use of the recent XMesh wireless network technology, developed especially for the concept of smart cities (use in devices with little available memory and low processing power, serving numerous network points), capable of providing a Virtual Private Device Network (VPDN) for each network application (LUZ; MANERA; DONATI, 2017; OLIVEIRA; LUZ; MANERA, 2020; OLIVEIRA; MANERA; LUZ, 2021). By using the controller system in conjunction with the XMesh network, the need for not only the traditional traffic light control panels but also the communication cables between the various intersections of the city is eliminated. As a result, the vandalism practices of traffic light controllers are reduced (due to their reduced size, the controller system used can be installed inside the GFV) and cable theft (communication is carried out via wireless network), which are the agents causing the inoperability of most traffic light systems. The traffic light controller system also implements the Green Wave routine (synchronization between successive crossings/intercessions) in real-time. Figure 2 displays the improvements of the control system used as a basis for this work.
In this sense, following the projects previously developed, this work aims to transform a traffic light that has only GFVs and GFPs into a traffic light with a panel of Red, Green, and Blue Light-Emitting Diodes (Light- Emitting Diode Red, Green, Blue (LED RGB)) of matrix and addressable type, arranged in a mechanical support structure, having smooth transition curves between the LED panel for pedestrians and the LED panel for vehicles, in addition to a public lamp. And, as it is a solution that aims to improve previously existing technology, the new traffic light will also have its control and monitoring routines via the XMesh wireless communication network.

2 OBJECTIVES OF THE INVENTION

Develop an LED panel controller equipment to be applied in an urban traffic light system, where information will be exchanged between the traffic light controller (described in the previous section) and the panels, in order to show relevant information, such as the remaining time of the signal, additional information on the number of available parking spaces and sensor data from Internet of Things (IoT) applications from the region around the traffic light, to carry out traffic control and share such information with drivers and pedestrians, as presented in Figure 3.

Therefore, within the purpose of this work, the use of an RGB LED panel for traffic light control can contribute to intelligent traffic management, by clearly exposing information to drivers and pedestrians, as well as helping to improve the physical and mental health of citizens. . On the other hand, when using
gas or temperature sensors, for example, it can contribute to the development of new public policies to reduce the environmental impact and, in this way, can contribute to the deceleration of global warming.

Figure 3 – Initial idea of the traffic light with luminaire and RGB LED panels applied to intelligent traffic management.

3 ADVANTAGES OF THE INVENTION

With the increase in the national fleet of vehicles and the limitations of the current traffic light systems that are rudimentary, traffic problems grow more and more, are daily topics in the press and frequently addressed by governments. Therefore, there is a growing demand for solutions aimed at greater traffic flow in urban centers (AZEREDO, 2014; RODRIGUES, 2019; JUNIOR, 2021).

According to Giovanelli et al. (2011), the official fleet of vehicles in the city of São Paulo in 2011 was approximately 7 million vehicles, where 3.8 million of these vehicles circulated daily through the 17 thousand kilometers of roads in the capital of São Paulo. Due to the high number of vehicles on the roads, in 2011, the Traffic Engineering Company (CET) recorded an average speed in the city of São Paulo of 32 km/h in the morning rush hour (7 am to 10 am) and 18 km/h in the early evening rush hour (5 pm to 8 pm). The research was carried out in some parts of the city and, in sections with the most intense traffic, the average speed reached 8 km/h. The slowness of traffic leads to a loss of approximately 30 billion reais annually in lost productivity and material expenses, mainly with wasted fuel (MUGNELA, 2012).

Since vehicles are the main source of air pollution, the greater the number of vehicles in circulation, the greater the emissions of harmful gases into the atmosphere. According to the Environmental Company of the State of São Paulo (CETESB), cars dump 1.7 million tons of harmful substances into the atmosphere every year (GIOVANELLI et al., 2011). About 528,000 tons of local pollutants were emitted per year between 2003 and 2014. With traffic management through a traffic light system, it is possible to reduce the emission of polluting gases into the atmosphere by up to 20% (OLIVEIRA, 2020). In addition to traffic lights controlling traffic through colors, with the modernization of current systems, it would be possible to add sensors that indicate the levels of pollution on the roads, where this information is relevant for traffic improvement.

The project aims to contribute to one of the United Nations (UN) 17 Sustainable Development Goals (SDGs) in Brazil. Specifically the objective of making cities and communities sustainable (Goal 11), where
by 2030 it aims to reduce the per capita negative environmental impact of cities, including by paying special attention to air quality and municipal waste management (UN, 2018).

With this, the concept of smart city grows continuously, which includes technologies that promote greater energy efficiency and services in cities. There are intelligent systems for monitoring and managing urban infrastructure and anticipating natural accidents, using sensors and artificial intelligence systems that quickly perceive and respond to events in the physical world (WEISS; BERNARDES; CONSONI, 2015).

To solve these problems, the project offers an opening for a series of applications for traffic management where there is no need to use wires, making it possible to integrate useful information for pedestrians and drivers, which can be presented on the RGB LED panels in a clear. Information such as temperature, CO2 emission level, quantity and orientation of available parking spaces on the roads, the time count in each traffic light color and the possibility of displaying the average speed of vehicles on the road. The system will control the RGB LED panels at traffic lights for vehicles and pedestrians.

4 DETAILED DESCRIPTION OF THE INVENTION

Starting from the first in designing an RGB LED panel, both for vehicles, with 8 lines and 24 columns totaling 192 SMD RGB LEDs, and for pedestrians, with 11 lines and 9 columns totaling 99 SMD RGB LEDs. Considering that the LEDs are close to each other, which makes their homemade production difficult, the project was carried out on the CAD EasyEDA platform, and the prototyping is being carried out by the JLCPCB. Where the protection's power tracks are thick and well grounded, to reduce heat dissipation.

Since the RGB LEDs are addressable, which requires the use of appropriate protocols and communication buses, specified by the manufacturer's datasheet, it was idealized to use an Arduino kit to program the traffic light functions. However, the use of a microcontroller with the lowest possible cost is considered, which meets the requirements of operating in high temperature ranges, due to the working conditions of a real traffic light that is exposed to the sun and rain. It is also required that the microcontroller has a UART peripheral to communicate with the devices that will send the information that will be displayed on the panel, such as the color and time of the traffic light color, sensor data from IoT or other information relevant to the citizens.

Also for the prototype hardware and firmware design, it is necessary at least 7 GPIOs to control the LEDs, 3 for the vehicular panel, 3 for the pedestrian panel and 1 to activate the LED light of the traffic light itself, which, in the prototype, can be activated via transistor, and in the final version it should be activated via MOSFET (DC luminaires) and via thyristor (AC luminaires). In Figure 4 The initial idea of the RGB LED panel controller system applied to intelligent traffic management is shown.
Figure 4 – Initial idea of the RGB LED panel controller system applied to intelligent traffic management.

5. GPIO - UART

Source: Own authorship.

The project, until the moment of submission of this article, is in the firmware development stage where it will interpret the data received via UART, such as vehicular red, yellow and green times; red and green times for pedestrians; and special data as mentioned above. The information must be displayed in specific regions of the screen.

It is worth mentioning that the panel designs have already been sent and are awaiting the completion of the prototyping to continue the tests with the performance of the panels in relation to the firmware and operation after fixing them in the idealized mechanical structure. The project may undergo minor changes over time due to the accumulated learning and results obtained after the completion of each goal described above.

THANKS

To all the professors, for all the advice during my studies, especially to professors Dr. Paulo Denis Garcez da Luz and Dr. Flávio Luiz Rossini and to Me. Luiz Fernando Pinto de Oliveira, who play a fundamental role in scientific research.

CHAPTER 111

Management by skills in professional orientation:
Approach to methods for identifying and mapping competencies

ABSTRACT
Faced with an increasingly dynamic and demanding market, a professional must have some skills to have a competitive edge. Essentially stopping a behavior resulting from a set of knowledge, skills and attitudes appropriate to develop their activities. The competency management approach in a professional orientation is a functional and effective model for leveraging, developing and mobilizing better professional performance to promote sustainable career growth. Therefore, the general objective of this study is to approach the main concepts for the use of management by competences, with specific objectives on the notion of competence and its dimensions, in order to identify and map competences in professional guidance.

Keywords: Competence, Management, Guidance.

1 INTRODUCTION

Labor relations in a typically competitive market consider the current moment of constant transformations, which occurs due to the impacts that the news in technology they bring every day, which transcends competition, and is sustained by the constant innovation, through dynamic, systemic and cognitive processes, favors the search for professional guidance that understands this basis built on competencies such as solutions to problems that are solidified in the labor market.

With the perception of the importance of competences being a source of value both to the individual, as to the organization, therefore, competency management arises, and the question problem: Is the competency management approach in career guidance functional?

The general objective of this study is to approach the main concepts for the use of management by competences, with specific objectives on the notion of competence and its dimensions, in a proposal for the identification and mapping of competences in professional guidance.

The relevance of the competency management approach in an orientation is justified by being a functional and effective model of leverage, development and mobilization of better professional performance to promote a sustainable career growth.

The methodology used is of a basic research nature, procedures were used bibliographic references to works and publications by various authors for an approach qualitative and with an exploratory objective, and, being the research method used the inductive one:

The inductive method is a reasoning in which, using observations of facts particular, the researcher arrives at a general conclusion, that is, that it works like a law. The observation of a phenomenon, keeping the control of variables and in the same conditions, leads the researcher to conclude that in the future, if repeated identical conditions will achieve the same results. (MEDEIROS, 2019).
2 DEVELOPMENT

2.1 NOTION OF COMPETENCE

For Brandão and Borges-Andrade (2007) “the notion of competence is characterized as complex and multifaceted, and can be interpreted in different ways” so that the

The most favorable way to understand competences is rationally directed to the individual perspectives:

These inconsistencies and contradictions can be understood by exposing on the three intellectual currents that underlie the innovators' arguments - the psychopedagogical current, linguistics and psycholinguistics - when the ambiguous and fluid character of the notion of competence, which differs in each of these meanings; at the same time, however, these "various affiliations that generate these have points in common, among which one is more important: the valorization of from rationalization to notion and from individualization" (TARTUCE, 1999).

In order to understand that according to Oliveira (2008) apud Carbone (2006, p. 44) “a competence results from the mobilization, on the part of the individual, of a combination of resources [...]”:

Competence is understood, then, not only as a set of knowledge, skills and attitudes necessary to perform a certain activity, but also how the performance expressed by the person in a given context, in terms of behaviors adopted at work and resulting achievements (BRANDÃO; BORGES-ANDRADE, 2007).

Brandão and Guimarães (2001) state that “competence concerns the set of knowledge, skills and attitudes necessary to achieve a certain purpose”. These resources alone form dimensions insofar as they are interdependent, or that is, an individual is assumed to know specific principles and techniques for exposing a ability.
Thus, individually requires the person not only to have knowledge, but also to as well as skills and attitudes appropriate for the formation of a behavior professional, which is usually called competence (BRANDÃO; GUIMARÃES, 2001).

2.2 MAPPING COMPETENCIES

Although we have approached competence as an attribute related to a individual, this concept can also apply to work teams or even organizations (CARBONE; BRANDÃO; LEITE; VILHENA, 2009).

It is possible, then, to classify competences as human—also called individuals or professionals (those related to people, at the individual level) — and organizational (those that refer to attributes or capabilities of the organization in its entirety or of its production units), it is worth noting that a level influences the other and vice versa, in such a way that human competences affect organizational competencies and at the same time are influenced by them (CARBONE; BRANDÃO; LEITE; VILHENA, 2009, p. 49) apud (BRANDÃO and GUIMARÃES, 2001).

Therefore, companies adopt a competency-based management model seeking to direct its efforts in planning, capturing, development and evaluations at the individuals, of the work teams, consequently getting to work on organizational competences (CARBONE; BRANDÃO; LEITE; VILHENA, 2009).

Where according to Carbone, Brandão, Leite and Vilhena (2009, p. 51) the use of a The competency management model makes it possible, through indicators, to map and “identify the skills necessary to achieve the expected performance”.

Figure 1: the three dimensions of competence
2.3 MAPPING COMPETENCIES

Mapping competencies is to identify which technical and behavior will be part of the requirements for carrying out a professional activity and achieve a goal (PICANÇO et al., 2017).

By choosing to apply competency management in a situation of analysis professional, it will be necessary first of all to map these competences and there are necessarily twodifferent modes for this (RH PORTAL, 2022):

- Based on the resources and dimensions of each competency; or
- Based on performance benchmarks.

Based on the resources and dimensions of each competence, it is applied by formulating training or strategies for long-term adoption that involve knowledge, desirable skills and attitudes (RH PORTAL, 2022).

When the base is the performance benchmarks, it is necessary to map how each one of current competences acts in a favorable or unfavorable way for the achievement of objectives (RH PORTAL, 2022).

In both cases, there is a need to determine what the minimum knowledge required for each role or occupation. For example, support technicians need to master and know the technologies in use in the company, and a way simple way to assess this knowledge is by consulting the suppliers of these equipment, in order to evaluate the performance and degree of knowledge of each employee in that position. Likewise, it is possible to create programs or training, often provided by the manufacturer of the equipment or software used, in order to align the entire team with standards minimum knowledge of the material in use (RH PORTAL, 2022, p.18).
For mapping Schon et al. (2017) recommends “using the dimensions of the competence, that is, the knowledge, skills and attitudes necessary for the professional has the performance at work”, let’s see the example of mapping four competencies according to observable behaviors that are demonstrated by the individual:

Fonte: Adapted by author from SCHON et al. (2017, p. 31-34)
Other examples of competencies that can be mapped are: organization, planning, leadership, decision making, business vision, vision system, focus on results, interpersonal relationships, teamwork, agility, time management, empathy, flexibility, creativity and innovation, initiative and dynamism (SCHON, 2017, p. 35).

2.4 PROFESSIONAL GUIDANCE

Professional guidance, within the field of psychology, is necessary in the current social conjuncture, because in the job market the professional as stated by Couto (2014) “it is inserted in a dynamic world, extremely dynamic, fast and of a unparalleled ferocity when it comes to professional life.”

Professional guidance involves our possibilities of choice and, therefore, not even this moment always passes in a calm and safe way. What was to be a process of pleasurable pursuit can turn into endless and without satisfactory answers. Choosing is good, but it involves risks, in this respect, young people and adults can experience the anguish of having to enter or reschedule their professional life. The relevance of knowing this subject, leads us to the need to understand a procedural performance, which results in career education. We can consider this intervention as a psychosocial practice, since the choices are influenced by various facets of our lives (LAGO, 2017, p.5).

2.4.1 Professional Guidance by Competencies

Vocational guidance provides a career choice that is in line with knowledge of oneself and the reality of the job market, that is, Lago (2017, p.12) addresses by stating that “professions do not appear in people’s lives, only for a group of skills and competencies, they translate a lifestyle, or rather, a way of being and living in a specific context.”

A context that involves a social and cultural environment of the labor market, which makes a professional trying out new ways to reorganize and respond to this reality, from the beginning, due to this need, starting with the development of competences such as autonomy, creativity and adaptation to the social and cultural environment of the labor market, These skills are highly valued in the world of work (LAGO, 2017).

However, in many cases these professionals are guided by choices made under a linear vision, always starting from a personal motivation, a taste or an interest in some activity, this does not lead to professional satisfaction, because, in order to be well successful in a profession it is necessary to have competences (LUCCHIARI, 2002).
The process of Vocational Guidance by Competencies can awaken and strengthen, the planning to develop the necessary skills to build your professional life, knowing how to interpret, evaluate and choose their possibilities, considering their skills and the real scenario (LEVE; SOARES, 2002). If we think about this issue through the prism of the current movement to replace the notion qualification by the so-called competency model, perhaps we could consider this observation. From the rescue he made of the various constructions concepts of the notion of competence, Manfredi (1998) identified a set of historically and socially constructed connotations referring to this notion, which could be summarized as follows: a rational and efficient individual performance aiming at the adequacy between ends and means, objectives and results; a behavioral profile of people who add cognitive, socio-affective and emotional abilities, skills psychomotor and operational skills, acquired through pathways and individual trajectories (school, professional and other paths); performances resulting, primarily, from training strategies brokered and planned for the functionality and profitability of a given organism and/or social subsystem (LEVE; SOARES, 2002, p. 159).

With Vocational Guidance by Competencies, we can help people in the search for satisfaction, through the recognition of a professional identity, from the knowledge of the individual's intrinsic competencies to apply in the occupational world, and, prepare for work that comprises a synergistic combination of their knowledge, skills and attitudes, leading to a professional performance that guarantees choose a career in front of your future, and build it according to your vocation, which will certainly raise their joy as a consequence (LEVE; SOARES, 2002).

3 CONCLUSION

Faced with an increasingly dynamic and demanding market, a professional must have some skills to have a competitive edge. Essentially hold a behavior resulting from a set of knowledge, skills and attitudes appropriate to carry out their activities.

This is observed from the point of view of individuals, but companies in this market have professionals also identify competencies as a competitive differentiator in addition to individual skills, such as group skills and organizational skills. So that in the people management area, companies approach the issue of competences: identifying them, mapping them and developing them with controls and action plans, that is, carrying out their.

Based on this same premise, in order to anticipate this management of competences, the professional competency guidance is an efficient option to help people in the search for a professional identity that brings him a satisfaction of acting, starting from the knowledge of their skills to direct their vocations.

Thus, professional guidance needs to be efficient, through the recognition of a professional identity, based on the knowledge of intrinsic competences of the individual to apply in the occupational world, such gains are evidenced when the oriented understands that a synergistic combination of their knowledge, skills and attitudes are decisive for a professional performance, which guarantees to choose front your future a career and build it according to your vocation.

The competency management approach in a professional orientation is an effective model of leveraging, developing and mobilizing better performance to promote sustainable career growth.

ABSTRACT
The administrative contract can be considered an agreement between the Public Administration and other administrative or private entities. In order to ensure that all contractual obligations are fulfilled, the contractor must appoint the contract manager and supervisor. These servers will be responsible for monitoring and inspecting the contract throughout its execution. Considering that contract managers and inspectors play a fundamental and highly responsible role in Public Administration, this article aims to identify the profile of the servers responsible for the management and inspection of administrative contracts at the Federal Institute of Santa Catarina/IFSC. As for the methodology, the questionnaire composed of 26 questions was elaborated through an online form and applied only to servers who act as managers and inspectors of administrative contracts of the Federal Institute of Santa Catarina/IFSC. The results obtained with this research are worrying, as more than half of the servers answered that they did not receive training before being appointed as manager or supervisor. In addition, 75% of respondents do not feel fully prepared and qualified to act in contractual management and inspection.

Keywords: Administrative Contracts, Management and Inspection, Federal Institute of Santa Catarina.

1 INTRODUCTION
Contracts in the Public Administration are drawn up in accordance with certain rules established mainly by Law no. 8,666/93. The contract is concluded between the contractor and the contractor and presents all the obligations of the parties. To ensure that all clauses contractual obligations are fulfilled, the contractor must appoint the manager and supervisor of the contract. You officials appointed to assume such functions are responsible for monitoring and monitoring of the contract throughout its execution. In addition to being essential to have an efficient management and inspection in each contract, it is important that managers and inspectors are organized and capable people for the occupation. In this context, do the civil servants appointed as managers and inspectors feel prepared to take on this responsibility?

The present research is justified, as it is a topic of great relevance and importance for the Public Administration and considering that the manager and the contract inspector play a fundamental role and of great responsibility not only within the Institute Federal de Santa Catarina (IFSC), as well as in other public agencies.

This article has the general objective to identify the profile of the responsible servers for the management and inspection of the administrative contracts of the Instituto Federal de Santa Catarina/IFSC.
It also has the following specific objectives: to identify the profile of managers and contract inspectors, to analyze if the servers feel prepared to act as managers or inspectors and propose alternatives to improve contractual management and inspection.

As for the Methodology, the research was developed through an online questionnaire, forwarded to the servers of the Federal Institute of Santa Catarina (IFSC) who work in the management and inspection of administrative contracts.

The present study is organized in 05 sections. In section 2, we present the theoretical foundation. The methodology is exposed in Section 3. Section 4 presents the Results and discussion. Section 5 ends with final remarks.

2 THEORETICAL FOUNDATION

2.1 PUBLIC ADMINISTRATION

The Public Administration is responsible for carrying out services and actions that are of public interest and can be considered as a “set of bodies, services and agents of the State that seek to satisfy the needs of society, such as education, culture, safety, health, etc.” (SILVA, 2019).

According to the Federal Constitution (1988), public administration will follow the principles constitutional principles of legality, impersonality, morality, publicity and efficiency. These principles have the function of “giving validity and coherence to the acts of public administration, controlling its activities and the agents that perform their functions directly or indirectly in your name” (SILVA, 2019).

Considering the constitutional principles and the management of public resources, the Public Administration acquisitions must comply with the rules established by law, mainly Law 8.666/1993, which provides for general rules on bidding and administrative contracts pertaining to works, services, including advertising, purchases, disposals and leases within the scope of the Powers of the Union, the States, the Federal District and the Municipalities (BRAZIL, 1993).

2.2 ADMINISTRATIVE CONTRACTS

The administrative contract can be defined as the adjustment in which the Administration Public, establishes with the private or other administrative entity to meet the public interest needs, according to the requirements determined by the Administration (NOVO, 2018).

The Art. 2 of Law 8.666/1993, clarifies that

Single paragraph. For the purposes of this Law, any agreement between Public Administration bodies or entities and individuals is considered a contract, in which there is an agreement of wills for the formation of a bond and the stipulation of reciprocal obligations, whatever the denomination used (BRAZIL, 1993).

The main contracts that the Public Administration signs with individuals are related to public works, provision of services and supply of goods (ENAP, 2013).
Also according to Law 8.666/1993, contracts must be clear and precise in regarding the conditions for its execution. Contract clauses must establish the rights, obligations and responsibilities of the parties (contractor/contractor) (BRASIL, 1993). It is at the time of the execution of the administrative contract, that the fulfillment of the object, their terms and conditions, will be managed, controlled and supervised by the Administration Public (ENAP, 2013).

2.3 MANAGEMENT AND INSPECTION

According to Lima (2016), much of the specialized doctrine understands that the Contractual inspection function can be divided into: management and inspection. According to Costa (2013), the inspector should not be subordinated to the contract manager and the activities of manager and tax must not be assigned to the same person.

The Art. 67 of Law 8.666/1993, determines that

“the execution of the contract must be monitored and supervised by a representative of the Administration specially designated, allowing the hiring of third parties to assist it and subsidize it with information pertinent to this attribution” (BRASIL, 1993).

For the author Justen Filho (2014), contractual inspection is not a faculty assured to the Administration, but “it is a duty, to be exercised in order to better carry out the fundamental interests. It is even assumed that the inspection induces the hired to perform more perfectly the duties imposed upon him.”

The representative of the Administration must act based on Art. 67 of Law 8.666/1993.

“Its 1st paragraph defines the obligation to record in the proper book all occurrences related to the contractual performance, and to determine what is necessary to regularize the faults or defects. Paragraph 2 states that decisions and measures that go beyond the competence of the representative must be requested by him from his superiors in a timely manner for the adoption of the appropriate measures. Failure to take action constitutes an administratively punishable offense, which sets the tone for the expected good performance of the inspectors” (ALMEIDA, 2009).

Like the Administration, the contractor also has a representative, called agent, who will be appointed by the company to monitor the execution of the contract (ENAP, 2013).

It is extremely important that inspectors and managers are aware of the different responsibilities that belong to each one. In this way, they will be able to follow the performance of the contract and verify more precisely the cases of irregularities, in addition to use tools to avoid the occurrence of behaviors that harm the activities contractual obligations, as well as serving the public interest (LIMA, 2016).

Management should not be confused with Inspection. Management is a service administrative role that can be exercised by a server or by a sector, being responsible for the overall management of all contracts, including economic rebalancing issues financial, documentation, control of expiration dates, extension, etc. already the supervision is assigned to a server, specially designated for that function, who will monitor the contract more punctually (ALVES, 2004).
According to art. 39 of Normative Instruction no. 05/2017,

The management and inspection activities of contractual execution are the set of actions that aim to assess compliance with the results expected by the Administration for the contracted services, verify the regularity of social security, tax and labor obligations, as well as provide support to the procedural and forwarding the relevant documentation to the contracts sector for the formalization of procedures related to renegotiation, alteration, rebalancing, extension, payment, possible application of sanctions, termination of contracts, among others, in order to ensure compliance with agreed clauses and the solution of problems related to the object (BRASIL, 2017).

The manager must have a global view of the contract, being under his/her responsibility for its administration and management. Furthermore, the manager

“it is responsible for analyzing reports sent by the contract supervisor; release of payments; price readjustment; amendments, such as: extension of the term, additions and deletions, economic and financial rebalancing; application of penalties and contractual termination, the latter with the indispensable consent of the competent authority of the body, always granting to those who want to penalize the right to prior defense” (LIMA, 2016).

The inspector is responsible for permanently monitoring the execution of the contract. In addition, the inspector can

“point out flaws and determine corrections and readjustments; clear doubts from the contractor's agent/representative to avoid incorrect activities that could generate rework with consequent delays in the evolution of the schedule; carry out measurements; instruct the processes of amendments, penalties and termination, providing the contract manager with substantial elements for carrying out these acts; prepare periodic reports and send them to the manager; fill in the diary or book of works and act in the provisional receipt of the contracted object” (LIMA, 2016).

Upon being appointed, the contract inspector must be prepared to perform such a function. This task has a high level of responsibility, as failure to correctly fulfill the function, it can cause damage to the treasury (ALVES, 2004). Furthermore, when the performance of contract enforcement is not efficient, can result in “widespread waste of resources, loss of object, punishments from servers that could be avoided, and even penalties applied unnecessarily to good contracted companies” (ALMEIDA, 2009).

When appointing the inspector, the Administration must decide on a servant who has sufficient technical knowledge of the contracted object. This person is responsible for verify that the contracted company is complying with the conditions determined in the Public Notice and in the winning proposal throughout the execution of the contract (COSTA, 2013).

In some cases, the civil servant appointed as contract supervisor may refuse this function, for example, if you have any family relationship with the contractor or even when they do not have specific technical knowledge for the contracted object. With that, the server must formalize a justification to the competent authority, explaining the situation and requesting the change of the inspector (ALVES, 2004).

For contracts that have extremely complex objects, such as works and engineering services, Management may hire third parties to assist in the process inspection, mainly with the provision of technical
information. In this case, the responsibility for contractual inspection remains with the Administration, however, when this activity is performed in a deficient manner, the contracted third party may also be held accountable (COSTA, 2013).

The legislation does not provide for how the Public Administration must appoint the public servant to carry out the monitoring activity of the contract. However, both the Court of Auditors of the Union and some scholars, understand that this designation must occur through of an official act/instrument issued and published prior to the start of validity.

3 METHODOLOGY

The research was developed with the servers of the Federal Institute of Santa Catarina (IFSC) that work in the management and inspection of administrative contracts. The work was carried out through a questionnaire composed of 22 closed and 04 open questions. The questionnaire was prepared using an online form. The questions applied to servers can be viewed in Appendix A. Servers received the questionnaire by e-mail and were informed about the objective and purpose of the research. The questionnaire was applied between May 02 and 08, 2019 and answered by 95 servers from different Campus, in addition to the Rectory.

After collecting and manipulating the questionnaire data, the analysis of the information. The results will be presented throughout this article. This job encompassed a quantitative and qualitative research, through the study of the data obtained and the analysis and interpretation of the results of the questionnaires. The bibliographic research also helped in the elaboration of the questionnaire and the work as a whole.

4 RESULTS AND DISCUSSION

The Federal Institute of Santa Catarina (IFSC) is a federal public institution of teaching that operates in the provision of professional, scientific and technological education, offering courses at various levels: professional qualification, youth and adult education, technical courses, higher and postgraduate courses (IFSC, 2019).

The institution is a federal agency linked to the Ministry of Education. it is headquartered in Florianópolis and has administrative, patrimonial, financial, didactic autonomy pedagogical and disciplinary (IFSC, 2019).

In addition to the Rectory, the Federal Institute of Santa Catarina currently has 22 Campuses installed throughout the State, being: Araranguá, Canoinhas, Caçador, Chapecó, Criciúma, Florianópolis, Florianópolis - Continente, Garopaba, Gaspar, Itajaí, Jaraguá do Sul – Center, Jaraguá do Sul – RAU, Joinville, Lages, Palhoça, São Carlos, São José, São Lourenço do Oeste, São Miguel do Oeste, Tubarão, Urupema and Xanxerê (IFSC, 2019).
The Federal Institute of Santa Catarina has a Contracts Department that is linked to the Dean of Administration (Proad). Managers and Tax (Administrative, Technician and Alternates) of contract are appointed by means of an Ordinance issued by the General Direction of each Campus.

Next, the results that were obtained through the application of the questionnaire for civil servants who work in the management and inspection of contracts at the Instituto Federal of Santa Catarina.

Most respondents (54%) are female. Almost half of survey participants (47%) are aged between 30 and 39 years, while only one person (1%) is over 60 years old. As for schooling, 60% of civil servants are Specialists, 4% have a Doctorate and one person (1%) has only a High School Technician. As for the server’s capacity Campus, the answers were quite varied, with the Criciúma Campus (13%) and the São Miguel do Oeste Campus (12%) stand out. With In relation to the position they hold at the Federal Institute of Santa Catarina, most of the interviewees work in the position of Assistant in Administration (40%), followed by the positions of Laboratory Technician (12%) and Administrator (10%). As for the length of service within the Institution, 39% are civil servants between 04 and 06 years and 2% for more than 16 years.

Regarding the role performed by the interviewed servers, only 15% responded that they act as managers, while the others carry out the activities of administrative, technical and alternate inspectors.

Subsequently, participants were asked to indicate the number of contracts that were under their responsibility, both in management and in supervision. Of the total of interviewed, 46 people (48%) responded that they are responsible for one or two contracts, while 17 people (18%) are responsible for more than eleven contracts. the amount of contracts can directly interfere in the quality of management and inspection, mainly, when we have a high number of contracts, which result in an overload of work when server and prevent it from dedicating itself entirely to monitoring companies hired.
As for the length of time in the role of contract manager or inspector, 7% of interviewees have been acting as managers or inspectors for more than ten years. However, 53% of the servers have been in office for less than three years, which can be considered a relatively short period, given the complexity and responsibility of these activities.

When asked if the server knew the manager/inspector's attributions, 61 servers (64%) responded that they know the assignments, 32 servers (34%) indicated the option “partially” and 02 servers (2%) responded that they have no knowledge of the duties of the manager/inspector. All civil servants should be aware of the manager/inspector's attributions. It is essential that the server knows its attributions and responsibilities, so that you will know what to do and how to act at the time of execution contractual.
Then, participants were asked to tick the option that indicated whether the server received some type of training, before taking on the role of manager/inspector. Of the 95 interviewed, only 30 participants (32%) responded that they received some type of empowerment. All civil servants should be trained prior to appointment as manager/inspector, in order to prepare them to monitor contracts more efficient and safe.

Regarding the amount of training on administrative contracts that the server participated from the moment of his appointment as manager/inspector, 42 servers (44%) responded that they participated in one or two training sessions and 07 servers (7%) participated in more than six trainings. However, 31% of those interviewed pointed out the option “none”, that is, they did not receive training from the moment of appointment as contract manager or inspector. Just as it is important to train before the appointment, continuing education is also essential, as the server must always be updated, taking into account that rules, laws or procedures may change during contract performance.
In the next question, participants were asked to indicate whether the server showed interest in participating in some type of training, from the moment of their appointment. Of all respondents, only 10 servers (11%) responded that they did not expressed interest in participating in some type of training.

In another question, respondents were asked to select the option that show if the server has knowledge about the object of the contract. Of the 95 participants, 61 servers (64%) responded that they have knowledge about the object of the contract, while 04 servers (4%) opted for the “no” alternative, that is, they answered that have no knowledge of the contracted object. When the server has knowledge about the object of the contract, management/inspection becomes simpler and uncomplicated, facilitating the contractual follow-up process.

Graph 6 – Knowledge about the object of the contract in which he acts as manager/inspector.

As for the academic training of the server and its relationship with the object of the contract in who acts as manager/tax. Of the servers interviewed, 30 participants (32%) responded that academic training is related to the object of the contract. Nonetheless, 40 participants (42%) responded that academic training does not have any type of relationship with the contractual object. When the academic formation is related to the object of the contract, the server feels more secure and prepared to assume the role of manager/inspector.
Regarding the participation of the server in the planning stage of the contracts in which acts as a manager/inspector, the majority of respondents (55%) responded that they did not participate of the contract planning stage. Only 16 servers (17%) participated in the stage of planning contracts in which they act as manager/inspector.
Then, it was asked how the server evaluates its knowledge about the Normative Instruction no. 05/2017. Most respondents (44%) rate their knowledge as “regular” and only 02 servers (2%) marked the option “excellent”. THE IN n. 05/2017 regulates the rules of the procedure for contracting services, therefore, the contract manager/inspector must have full knowledge of this document.

Graph 10 – Knowledge about Normative Instruction n. 05/2017 (rules and guidelines of the service contract procedure).

As for the main problems faced during the management/inspection of contracts, of the 95 interviewees, only 16 servers responded that so far, they have not had problems or difficulties in managing/inspecting contracts.

The main problems pointed out by most servers were: breach of obligations by the contractor and lack of standardization of internal regulatory procedures and instructions. Other points were mentioned with less frequency, but which also deserve to be highlighted, such as the lack of training, doubts in relation to labor legislation, civil servants with accumulation of attributions and a high number of of contracts to follow up.

In the next question, it was asked if the server has access to all documents essential aspects of contracting and for the inspection of contracts. Of the participants, 80 respondents (84%) responded that they have access to all documents, while 15 respondents (16%) responded that they do not have access to documents.

With respect to the frequency with which the server monitors the performance of the contract, the responses were quite diverse, but the majority of respondents (36%) responded that monitor the performance of the contract on a daily basis. The follow-up frequency contract is quite variable, as it depends on many factors, such as the type of contract object.
Regarding the recording of occurrences that occur during the execution of the contract, the Most respondents (66%) responded that they record the occurrences, while 12% responded that they do not record during the execution of the contract. It's from responsibility of the server, register all occurrences that happen during the performance of the contract, whether positive or negative.

Then, it was asked if the server feels prepared and qualified to act as manager/inspector of IFSC contracts. Of the respondents, only 24 servers (25%) feel prepared and qualified for the role. However, 55 servers (58%) indicated the option “partially” and 16 civil servants (17%) do not feel prepared and qualified to act as a contractual manager/inspector. It is essential that the server feels prepared and qualified to act as manager/tax. Thus, in addition to requiring the company to comply with with all the obligations signed in the contract, he will be able to carry out the follow-up with a more careful and detailed look throughout the contractual execution period.

Soon after, the participants were asked to justify the option marked in the question previous question, which asked if the server feels prepared and qualified to act as a contract manager/inspector. Respondents who opted for the “no” alternative justified their response in the sense that there is a lack of capacity building and training; there are no procedures standardized and some servers for being in the
didactic-pedagogical area do not have technical and administrative knowledge for the performance. The employees interviewed who marked the option “partially”, also cited the lack of training and trainings; absence of standardized procedures, in addition to the accumulation of attributions for some servers. The servers who opted for “yes” answered that they have experience in the area of contracts and received training to work in management/supervision contractual.

Regarding the interest of the server in participating in a course or training in the area of administrative contracts, 81% of respondents chose the “yes” alternative, that is, they have interest in participating in courses or training. While 17 servers (18%) marked the option “maybe” and 01 server (1%) is not interested in participating in courses or training in the area of administrative contracts.

In the last question, participants were asked how the IFSC should offer courses or training on contracts. Most participants (69%) opted for alternative “in person and virtual”, followed by the options “virtual” with 17% and “in person” with 17% 14%.

Finally, after applying the questionnaire and obtaining a very expressive number of responses, it was possible to identify the profile of the managers and inspectors of the contracts administrative offices of the Federal Institute of Santa Catarina, mainly in relation to the training and preparation of these servers who carry out activities of great responsibility within the Public Administration.

5 FINAL CONSIDERATIONS

The present research sought to apply a questionnaire to the servers that work in the management and inspection of administrative contracts at the Federal Institute of Santa Catarina. The first part of the questions sought to identify the server's profile, including gender, age, schooling, campus, position and length of service at the Instituto Federal de Santa Catarina. In the second part of the questionnaire, the questions were more specific and directed to the management and inspection of administrative contracts.

The results obtained with this research are worrying, as it was observed that more half of the civil servants interviewed answered that they did not receive training before being appointed as manager or supervisor. It is essential to carry out training for the servants even before assuming the functions of manager or inspector, mainly for those who do not have much knowledge and mastery of administrative areas, such as for example, teachers and technicians in the pedagogical area.

Another important and significant fact is that 71 participants (75%) do not feel fully prepared and qualified to act in contractual management and inspection, justifying the absence of training and standardized procedures, so that the management and contractual inspection activities are performed efficiently, the server must feel safe and prepared to make decisions and to demand that the company fulfills all obligations established in the contract.

With regard to the problems faced during management and inspection, the interviewees cited the breach of obligations by the contractor and absence of standardization of procedures and internal normative instructions.
In view of the above, it became evident that contract managers and inspectors exercise a function of great importance and relevance within the Public Administration. The execution contractual is a step that requires a very careful monitoring by managers and tax authorities, as they can and should prevent the occurrence of irregularities and illegalities that may harm the Public Administration as a whole.

In this sense, at the end of the research and verifying that the objectives presented were fulfilled, it is worth highlighting some proposals that may be implemented by the Instituto Federal Santa Catarina to improve contract management and inspection activities: normative instructions and standardized procedures for servers to have parameters to monitor contracts; empower servers before naming them as managers or inspectors, especially those who do not work in the administrative area (eg. teachers); and promote training more frequently, whether virtual or face-to-face.

In addition, it is also suggested that contractual management and inspection should not be centralized and/or always directed to the same servers, mainly on campuses where the number of servers is reduced which can result in an overload of job.

Finally, it is important to emphasize that managers and inspectors must act in order to prevent poor contractual performance from harming the Institute's public interest activities of Santa Catarina and the Administration as a whole.
REFERENCES

ABSTRACT

This article discusses the efficiency of the Runge-Kutta classical of fourth-order, Dormand-Prince and Bulirsch-Stoer numerical methods in solving initial value problems. The three methods were compared by solving a problem of the suspension dynamics of a vehicle when passing over a speed bump in the lane. The problem is described by a second order ordinary differential equation. Results were obtained by varying the initial step size equally for the three methods, and the behavior of the vehicle suspension in response to the speed bump height was analyzed for each step size. It was concluded that it is essential to know the nature of the problem to be solved, to properly choose the numerical method and the size of the integration step to be used. The higher the order of the integration method, the greater the possibility of using a larger step size with the desired precision. Therefore, knowledge of the nature of the problem is essential for choosing the solution method and the size of the integration step to obtain adequate results.

Keywords: numerical methods, ordinary differential equations, runge-kutta, dormand prince, bulirsch-stoer.

1 INTRODUCTION

Several problems encountered in the sciences, particularly in engineering, can be solved by mathematical modeling that results, for the most part, in differential equations. Ordinary differential equations (ODEs) are a subset of this universe, which constitute the formulation of initial value problems for a variety of processes and systems. The solution of these problems can be obtained by solving the ODEs that describe the dynamics of the system (GEAR, 1971, NAGLE; SAFF; SNIDER, 2018, DUTTA et al., 2020). One of the fundamental tools to obtain these solutions are numerical methods (LAPIDUS; SEINFELD, 1971, HULL et al., 2006, BISWAS; CHATTERJEE; MUKHERJEE, 2013, BRONSON; COSTA, 2014).

One of the advantages of modeling processes using ODEs is that they can be solved using numerical integration methods, without the need to focus deeply on the theoretical aspects of the mathematical models used (STOER; BULIRSCH, 2002, QUARTERONI; SACCO; SALERI, 2007, PRESS et al., 2007).

Studies of methods of solving ODEs showed over time that most of them could not be solved by simple integration or analytical solutions alone (BRONSON; COSTA, 2014, NAGLE; SAFF; SNIDER, 2018). In many or most cases, it became necessary to use numerical methods to obtain an approximate
solution, with desired accuracy, using efficient computational algorithms, enabling the solution of complex problems.

Methods for solving ODEs can be seen as originating from different models, which facilitates the understanding of the problem, and computation is closely linked to the origin of the problem and the use that will be made of the answers. Therefore, modeling and computational methods are not steps to be taken separately from reality and is embedded in a broader context, which involves numerical analysis. In this context, a numerical method is a mathematical tool designed to solve numerical problems and its implementation, with an appropriate convergence check, consists of the creation of a numerical algorithm implemented in a programming language or on a computational platform (QUARTERONI; SACCO; SALERI, 2007, ZILL, 2018).

Among the first numerical methods developed, Euler's methods stand out (BOYER, 1996), which, due to their simplicity, are used to facilitate the understanding of the concepts involved in numerical integration methods, besides providing satisfactory results for some problems, under certain conditions and constraint (CORLESS, 2000, BISWAS et al., 2013, SHAMPINE).

Several other methods have been developed, which provide more accurate results for more complex problems, although they require more sophisticated algorithms and longer computational time. Among the most modern classical numerical methods are the Runge-Kutta methods, and its improvements, and the Bulirsch-Stoer method (BUTCHER, 2000, PRESS et al., 2007).

Several works with applications of numerical methods for the solution of various types of problems are found in the literature. However, details on the development and theoretical foundation of these methods are found in classic textbooks (GEAR, 1971, NAGLE; SAFF; SNIDER, 2012, ZILL, 2018).

Technical-scientific articles on the subject are generally found and presented in dissertations and theses and do not contain theoretical details about the methods used to obtain the results. However, these articles serve as a reference for comparison of results and validation of new methodologies or approach techniques to solve new problems (VANANI; AMINATAEI, 2011, OBERLEITHNERA; PASCHEREITA; SORIA, 2015, DUTTA et al., 2020; GHANBARI; BALEANU, 2020, HOSSEINI et al., 2020, BOSCH NETO et al., 2020).

In this context, this paper presents a comparison of the efficiency of the classical fourth-order Runge-Kutta method, Dormand-Prince method, and Bulirsch-Stoer method in solving the problem of suspension dynamics of a vehicle.

2 LITERATURE REVIEW

A problem involving ordinary differential equations, generically, is reduced to the study of a set of N coupled first-order differential equations for a function y_i, i=1,2,...,N, expressed by the following general form (PRESS et al., 2007):
\[
\frac{dy_i(x)}{dx} = f_i'(x, y_1, \ldots, y_N), \quad i = 1, \ldots, N
\]

The functions \( f_i' \) on the right-hand side in Equation (1) are known. The quotation mark ('') here does not mean derivative, but just a notation to remember that the functions \( f_i' \) are the derivatives of \( y_i(x) \).

A problem involving ordinary differential equations is not completely defined by its equations, because it depends on the nature of the initial conditions, which is crucial in determining the best way to approach it. Initial conditions are algebraic conditions on the values of the function \( y_i(x) \) in Equation (1) that can generally be satisfied at specific discrete points, but are not automatically preserved by the differential equations (NAGLE; SAFF; SNIDER, 2012, PRESS et al., 2007, ZILL, 2018).

Instead of being given initial conditions, boundary conditions can be presented along with the equation, and they can be as simple as requiring certain variables to have certain numerical values, or as complex as a set of nonlinear algebraic equations in their variables. Usually, it is the boundary conditions that determine which numerical methods are feasible, and are divided into two broad categories (PRESS et al., 2007, NAGLE; SAFF; SNIDER, 2012, ZILL, 2018):

Initial value problems - in this case, all \( y_i(x) \) are given for some initial value \( x_0 \), and one wishes to obtain the \( y_i(x) \) at some point for some final value of the independent variable, \( x_f \), or at some list of discrete points;

Two-point boundary value problems - here the boundary conditions are specified at more than one value of \( x \). Typically, some of the conditions are specified at \( x_0 \) and the rest at \( x_f \).

2.1 FOURTH-ORDER RUNGE-KUTTA METHOD

The fourth-order Runge-Kutta method is the most popular of the explicit one-step methods, described by Equation (2). Without going into details, a schematic illustration of this method is presented in Figure 1 (PRESS et al., 2007, NAGLE; SAFF; SNIDER, 2012, ZILL, 2018).

\[
\begin{align*}
k_1 &= h \cdot f(x_n, y_n) \\
k_2 &= h \cdot f(x_n + 0,5 \cdot h, y_n + 0,5 \cdot k_1) \\
k_3 &= h \cdot f(x_n + 0,5 \cdot h, y_n + 0,5 \cdot k_2) \\
k_4 &= h \cdot f(x_n + h, y_n + k_3) \\
y_{n+1} &= y_n + \frac{(k_1 + 2 \cdot k_2 + 2 \cdot k_3 + k_4)}{6}
\end{align*}
\]
2.2 DORMAND-PRINCE METHOD

The seven-stage Dormand-Prince method with local error estimation and interpolator is presented in a Butcher framework (Table 1). The solution is advanced with $y_{(n+1)}$ of order five, a procedure called local extrapolation, and the solution $y^\wedge_{(n+1)}$ of order four is used to obtain the local error estimate via the difference $y_{(n+1)} - y^\wedge_{(n+1)}$. In fact, $y^\wedge_{(n+1)}$ is not calculated, instead, the coefficients in the $b^T b^\wedge$ row in Butcher’s framework are used to obtain the local error estimate. The sixth constant (C_6) in the higher-order error term is minimized, maintaining stability. Six stages are needed for the order 5 method and for the seventh stage it is necessary to have an interpolator, which is the last row in Table 1 (ASHINO; NAGASE; VAILLANCOURT, 2000).

This seven-stage method, in practice, reduces to six stages because $k_1^{(n+1)} = k_7^{(n)}$, and the row vector $b^T$ is equal to the seventh row corresponding to $k_7$. The absolute stability range of this method is approximately (-3,3,0), as shown in Figure 2. This method is implemented in computational subroutines in several platforms, such as MATLAB (ASHINO; NAGASE; VAILLANCOURT, 2000), OCTAVE and SCILAB.

2.3 BULIRSCH-STOER METHOD

To understand this method it is necessary to discuss the modified midpoint method, which has its most important application in the Bulirsch-Stoer Method. Another technique that can be combined with the Bulirsch-Stoer method is the Richardson Extrapolation. A brief discussion of these methods is presented below (STOER; BULIRSCH, 2002, PRESS et al., 2007).

2.3.1 Modified Midpoint Method

The modified midpoint method consists of advancing a vector of dependent variables, \( y(x) \), from a point whose abscissa is \( x \) to \( x + H \) by a sequence of \( n \) sub-steps of size \( h \) each, given by Equation (3):

\[
h = \frac{H}{n}
\]

The number of right-hand side evaluations required by the modified midpoint method is \( n+1 \). The formulas for this method are:

\[
\begin{align*}
z_0 &= y(x) \\
z_1 &= z_0 \cdot h \cdot f(x, z_0) \\
z_{m+1} &= z_{m-1} + 2h \cdot f(x + m \cdot h, z_m); \\
y(x + H) &\approx y_n \equiv \frac{1}{2} [z_n + z_{n-1} + h \cdot f(x + H, z_n)]
\end{align*}
\]

Source: ASHINO; NAGASE; VAILLANCOURT, 2000 (Adapted).
The variables $z$ are intermediate approximations that march along the $h$ steps, while $y_n$ is the final approximation of $y(x+H)$. This is basically a centralized difference or midpoint method, except for the first and last points, which give the method the modified qualifier.

The modified midpoint method is second-order with the advantage that it asymptotically requires, for large $n$, only one evaluation of the first derivative per step $h$, instead of the two evaluations required by the second-order Runge-Kutta method. In general, the use of the modified midpoint method alone is outperformed by the Runge-Kutta method with adaptive step-size control built in.

The usefulness of the modified midpoint method for the Bulirsch-Stoer technique derives from the fact that it obtains, from Equation (4), a detailed result (STOER; BULIRSCH, 2002). It turns out that the error in Equation (4), expressed as a series of powers of $h$, contains only even powers of $h$:

$$y_n - y(x+H) = \sum_{i=1}^{\infty} a_i h^{2i} (5)$$

The value of $H$ is held constant, but the value of $h$ changes when $n$ varies in Equation (3). The importance of these even power series is that if the usual tricks of combining steps and eliminating higher-order error terms are applied, two more orders of accuracy can be obtained at a time. This process allows higher-order accuracy to be obtained with fewer evaluations of the derivative function, in general half as many as with the fourth-order Runge-Kutta method (PRESS et al., 2007).

### 2.3.2 Richardson Extrapolation

Richardson extrapolation uses the powerful idea of extrapolating a computed result to the value that would have been obtained if the step size had been much smaller than it actually was. In particular, extrapolation to step size zero is the desired goal. The first practical ODE integrator that implemented this idea was developed by Bulirsch and Stoer, and thus the extrapolation methods are often called Bulirsch-Stoer Methods (PRESS et al., 2007).

### 2.4 FORMULATION OF THE BULIRSCH-STOER METHOD

The sequence of separate attempts to cross the $H$-interval is made with increasing number of sub-steps, $n$. Bulirsch and Stoer originally proposed the following sequence (PRESS et al., 2007):

$$n=2,4,6,8,12,16,24,32,48,64,96,[n_j=2n_{(j-2)}],\ldots$$

According to Deuflhard (1983, 1985) the following sequence was more efficient:

$$n=2,4,6,8,10,12,14,[n_j=2j],\ldots$$

In this sequence, for each step, it is not known in advance where it will end up. After each successive intermediate step, $n$, a polynomial extrapolation is performed. This extrapolation gives extrapolated values...
and error estimates. If the error values are not satisfactory, the value of \( n \) is increased. If they are satisfactory, one proceeds to the next step and starts again with \( n = 2 \) (PRESS et al., 2007).

There is some upper bound, beyond which one concludes that there is some obstacle in the path along the interval \( H \), so one should reduce \( H \) instead of just subdividing it more finely, because loss of accuracy occurs if too fine a subdivision is chosen. In algorithm implementations using this method, \( n \) is usually taken to be equal to eight. The eighth value in the sequence expressed by Equation (7) is 16, which is the maximum number of subdivisions of \( H \) allowed (PRESS et al., 2007).

Error control is enforced by monitoring internal consistency and adapting the step size to match a prescribed limit on the local truncation error. Error control is represented in Table 2 by a kind of genetic algorithm, expressed in the form of Equation (8), where \( P \) represents a "daughter" and \( x \) represents its "parents".

<table>
<thead>
<tr>
<th>( x_0 ):</th>
<th>( y_0 = P_0 )</th>
<th>( P_{01} )</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>( x_1 ):</td>
<td>( y_1 = P_1 )</td>
<td>( P_{012} )</td>
<td></td>
</tr>
<tr>
<td>( x_2 ):</td>
<td>( y_2 = P_2 )</td>
<td>( P_{123} )</td>
<td></td>
</tr>
<tr>
<td>( x_3 ):</td>
<td>( y_3 = P_3 )</td>
<td>( P_{23} )</td>
<td></td>
</tr>
</tbody>
</table>

Table 2. Symbolic representation of Neville's algorithm.

Neville's algorithm is a recursive way to fill in the numbers in Table 2, one column at a time, from left to right. It is based on the relationship between a "daughter" \( P \) and its "parents" \( x \), as per Equation (9), that this recursion works, because the two "parents" already agree on the points \( x_{(i+1)} \cdots x_{(i+m-1)} \).

\[
P_{i(i+1)\cdots(i+m)} = \frac{(x_i - x_{i+m})P_{i(i+1)\cdots(i+m-1)} + (x_{i+1} - x)P_{i(i+1)(i+2)\cdots(i+m)}}{(x_i - x_{i+m})}
\]

Each new result of the modified midpoint integration sequence allows a frame, such as Table 2, to be extended by an additional set of diagonals, written as a lower triangular matrix, expressed by Equation (10):

\[
T_{00} \quad T_{10} \quad T_{11} \quad T_{20} \quad T_{21} \quad T_{22} \\
\ldots \quad \ldots \quad \ldots
\]

Where \( T_{k0} = y_k \), and \( y_k = y(x_n + H) \) calculated with step size \( h_k = H/n_k \). By substituting \( P = T \), \( x_i = h_i^2 \), and \( x = 0 \) into Equation (10), Neville's algorithm can be rewritten as:

\[
T_{k,j+1} = T_{kj} + \frac{T_{kj} - T_{k-1,j}}{(n_k / n_{k-1})^2 - 1}, \quad \forall \; j = 0, 1, \ldots, k - 1
\]
At each new step size $h_i$ a new row in the table is started, and then the polynomial extrapolation fills the rest of the row. Each new element in the table comes from the two closest elements in the previous column. The elements in the same column have the same order, and $T_{kk}$, the last element in each row, is the highest order approximation of accuracy at that step size. The difference between the last two consecutive elements is taken as the (conservative) error estimate. This error estimate can be used to adjust the step size. A good strategy was originally proposed by Deuflhard (1983, 1985), and later modified, details of which can be obtained from the literature (LAPIDUS; SEINFEILD, 1971, HAIRER; WANNER; NØRSETT, 1993, STOER; BULIRSCH, 2002, PRESS et al., 2007).

3 METHODOLOGY

3.1 VEHICLE SUSPENSION SYSTEM MODEL

The modeling of the suspension of a vehicle can be done by considering the vehicle driving over a hump. The force that the bump exerts on the suspension is described by the expression:

$$F_s(t) = a \cdot y(t) + b \cdot \frac{dy(t)}{dt}$$

Where:

- $F_s(t)$ = Force on the suspension, [N];
- $y(t)$ = Displacement caused by the track surface, [m];
- $a$ = Constant;
- $b$ = Constant.

The suspension model of the vehicle, considering a quarter of its size for symmetry, is represented in Figure 3.

![Figure 3: Model of the suspension system of a vehicle.](source)
In the simplified model, the masses of the wheel, tire, and axle are neglected and, for symmetry, the mass $m$ represents a quarter of the vehicle mass. The spring constant $k$ represents a combination of the effects of the tire and the suspension spring. The constant $c$ represents the damping constant of the shock absorber. The equilibrium position of mass $m$, when $y=0$, is $x=0$.

The displacement caused by the track surface, $y(t)$, can be obtained from the profile of the track surface and the vehicle speed. The equation of motion of the vehicle is obtained by means of the free body diagram, shown in Figure 4, considering only the dynamic force, because the static force is cancelled out by the gravitational force:

$$m \cdot \frac{d^2 x(t)}{dt^2} + c \cdot \frac{dx(t)}{dt} + k \cdot x(t) = k \cdot y(t) + c \cdot \frac{dy(t)}{dt}$$

Figure 4 - Free-body diagram, assuming that $\frac{dy}{dt} > \frac{dx}{dt} \Leftrightarrow y > x$.

3.2 SIMULATING THE VEHICLE RESPONSE TO THE RISE OF A SPEED BUMP

The response of a vehicle to the lift of a given hump with height $h$ and length $L$, moving at a speed $v$, can be simulated by solving the differential equation of motion, Equation (13). This requires the elevation profile of the hump, in this case given by (ÇENGEL; PALM III, 2012):

$$y(z(t)) = 5,4366 \cdot z(t) \cdot \exp(-4 \cdot z(t))$$

Whereby:

$y(z(t))$ = Spine elevation profile, [m];

$z$ = Horizontal distance traveled by the vehicle over the elevation, [m];

The displacement $y(t)$ felt by the suspension is related to $y(z(t))$, by means of the velocity, where $z(t)=v(t)\cdot t$. Substituting $z(t)$ into Equation (14) gives:

$$y(t) = 97,859 \cdot t \cdot \exp(-72 \cdot t)$$
For this work we used the data contained in Table 1. Combining Equation (14) with Equation (15) and substituting the data contained in Table 1, we obtain the equation of motion for this problem:

$$\frac{d^2x(t)}{dt^2} + \frac{5,000}{240} \cdot \frac{dx(t)}{dt} + \frac{16,000}{240} \cdot x(t) = \frac{489.290 - (33.663.152 \cdot t \cdot e^{-72t})}{240}$$

This is a second order initial value problem, so the solution of Equation (16) was performed using the fourth order Runge-Kutta and Dormand-Prince methods (BUTCHER, 2000, ASHINO; NAGASE; VAILLANCOURT, 2000) and Bulirsch-Stoer (STOER; BULIRSCH, 2002, PRESS et al., 2007), transforming it into a system of two first order equations of the form:

$$\begin{align*}
\frac{dx_1}{dt} &= x_2 \\
\frac{dx_2}{dt} &= C_1 \cdot x_2 + C_2 \cdot x_1 + f(x)
\end{align*}$$

4 RESULTS AND DISCUSSION

The computational time results and final solution estimates are given in Table 2 for various values of the integration step for the Runge-Kutta methods of order 4, Dormand-Prince and Bulirsch-Stoer. The variation of computational time as a function of step size is shown in Figure 5.

* RK4: Runge-Kutta, ordem 4; DP: Dormand-Prince; BS: Bulirsch-Stoer
It can be observed in Figure 5 that the behavior of the computational time in relation to the step size did not present a well defined functional trend. It was not possible, in this work, to find a reasonable explanation for this randomness, although it is thought that it may be an effect of the transient state of the computer processor used, influenced by some electromagnetic event. What was effectively verified was that different processing time values were obtained for the same problem when the processing was repeated.

It can be observed, however, that the computational time for the fourth order Runge-Kutta method, in general, was the lowest and for the Bulirsch-Stoer method was the highest, with the Dormand-Prince method in an intermediate position, but all presented coherent results. On the other hand, these results depend on the nature of the problem in relation to the method used. Therefore, for a different problem these results can be completely opposite. The final solutions are represented graphically in Figures 6, 7, 8 and 9.

Figure 6. Numerical solutions of the one vehicle suspension system problem using the fourth order Runge-Kutta method (k = 4), with fixed step, and the adaptive step methods of Dormand-Prince and Bulirsch-Stoer, with h = 0.05.
Figure 7. Numerical solutions of the one-vehicle suspension system problem using the fourth-order Runge-Kutta method (k = 4), with fixed pitch, and the adaptive pitch methods of Dormand-Prince and Bulirsch-Stoer, with h = 0.025.

Figure 8. Numerical solutions of the one-vehicle suspension system problem using the fourth-order Runge-Kutta method (k = 4), with fixed pitch, and the adaptive pitch methods of Dormand-Prince and Bulirsch-Stoer, with h = 0.0125.
Figure 9: Numerical solutions of the one-vehicle suspension system problem using the fourth-order Runge-Kutta method (k = 4), with fixed pitch, and the adaptive pitch methods of Dormand-Prince and Bulirsch-Stoer, with h = 0.00125.

It can be seen in Figures 6 to 9 that, for all methods, there was an improvement in the accuracy of the responses of the vehicle chassis displacement as a function of time, with the reduction of the integration step. However, it can be observed that the Dormand-Prince method presented, practically, the same response, regardless of the size of the integration step. Therefore, this method depends very little on the initial integration step, because of the step size adaptation process. In this problem, the fourth-order Runge-Kutta and Bulirsch-Stoer methods presented feasible solutions only for h<0.01, in the domain 0≤t≤0.25.

5 CONCLUSIONS

It is essential to know the nature of the problem to be solved, to properly choose the numerical method and the size of the integration step to be used. The higher the order of the integration method, the greater the possibility of using a larger step size with desired accuracy.

The Dormand-Prince method showed virtually the same response regardless of the integration step size. Therefore, this method depends very little on the initial integration step, because of the step size adaptation process.

Methods with a step adaptation algorithm, such as the Bulirsch-Stoer and Dormand-Prince methods, are not very sensitive to the initial step size because they are modified throughout the process to maintain accuracy.

In general, all types of methods can be applied to any initial value problem, each with its own set of pros and cons, which should be understood before they are used.

In all numerical methods, generally, accuracy increases with decreasing step size, especially in fixed-step methods. Therefore, adaptive pitch methods such as the Dormand-Prince and Bulirsch-Stoer methods generally provide more accurate estimates, provided they are used properly.
Therefore, it is concluded that knowledge of the nature of the problem is critical in choosing the solution method and the size of the integration step to obtain adequate results.

ABSTRACT
The work aims to understand the meanings attributed by a Geography professor who participated in the Pibid-UFSCar between 2010-2011. The research uses a qualitative approach and data collection through semi-structured interviews. In the interview, the graduate showed activities that he participated and the legacy obtained for his career. The respondent commented on their respective participations as a student and observer of the planning and practices developed at the school as a Pibid scholarship. We also tried to understand if the collaborative training between university and school allowed the graduate to perceive the challenges and interferences present in daily school life and that limit professional autonomy. Through Content Analysis, categories emerged such as: interdisciplinarity, curriculum and dispute, planning and school diagnosis. We also noticed cases in which Pibid acted as an inducer of research in education.

Keywords: Teacher Education, GDP, Planning.

1 INTRODUCTION
This work promoted a research in the area of the initial formation of a professor of the Geography course at the Federal University of São Carlos campus Sorocaba-SP. The teacher trained in the Geography course was a scholarship holder of the PIBIB Institutional Initiation Teaching Scholarship Program, created by the Ministry of Education at the time of Minister Fernando Haddad in the Lula II Government. This program is a public policy to encourage and induce the training of teachers in Brazil who have historically accumulated educational problems.

The initial training of teachers is one of the existing problems in Brazilian formal education. Thus, we studied the model of shared formation that involves the institutional relationship between university and school.

It is through shared training between university and school that it is currently possible to give new formats to teacher training curricula that begin to address more practices beyond the walls of the university.

Based on these new possibilities, with a public policy to encourage initial training, the partnerships between school and university provided undergraduate students with greater opportunities to get to know the reality of the schools and the professional performance they chose.
2 OUTLINE OF THE RESEARCH PROBLEM

Teacher training is a major challenge and the training of licensure courses needs to promote a close relationship with basic education schools. This proximity is important so that students can get to know the school routine as well as the existing problems and challenges.

Overcoming this challenge occurs, basically, through supervised and mandatory internships, but the school-university relationship still occurs in a discreet way, except for the cases of teachers and researchers who focus on basic education and the training of students. teachers.

However, with the creation of the PIBID, the school-university relationship started to happen in a more intense way, allowing the students of the licenciatura courses, together with the university professors, to have greater contact with the basic education schools, thus enriching the training processes of degrees. the training of teachers was happening in that new phase of the licentiates; something that involved the so-called shared education and which, since Minister Fernando Haddad, began to have a permanent public policy, applied to the initial training of teachers and the professional development of teachers.

Another issue that needed to be understood was the impact of this public policy on basic education schools, that is, how already trained teachers and the school community participated in the projects and subprojects carried out by the school-university partnerships.

We therefore thought of analyzing and understanding the process of training Geography teachers who participated in the Teaching Initiation Program (PIBID) of the Federal University of São Carlos, Sorocaba campus, in addition to understanding the functioning of school-university partnerships, as well as the course Degree in Geography at UFSCar-Sorocaba. We seek to understand the perception of former PIBID-Geography scholarship students who now work as professionals in basic education. It is therefore an ex post facto case study.

3 JUSTIFICATION

The PIBID works as an aid in the initial training of teachers. It enables students, university professors and basic education teachers to work together in promoting and implementing projects in schools.

At the time of the research, there were several very diversified projects and subprojects. There were pedagogical activities, scientific experiments, field work with monitoring visits to the university, science fairs in schools, reading workshops, mockup, photography, filming workshops, etc.

Therefore, having researched the functioning, structure and management of this program and its subprojects was important to understand this new public policy of training and valuing the teaching profession, as well as the planning disputes between the actors involved in the basis of public policy. Power and ego disputes between university and school and agents. Who studies and who is studied.

Therefore, overcoming the wall of strangeness between an enchanted palace of free and autonomous knowledge versus the prison of the State and Municipal Departments of Education was a curious fact to
see. He always asked whether, in addition to the contents of subjects and science workshops and fairs, apprentices to teachers perceived the disputes between the fields of power and the formation of hierarchies of domination between the various positions and functions. My hypothesis was that none of the PIBIDs would teach. In this pedagogical-administrative transversality, the learner to teacher would only learn by suffering in the skin when they started working and faced the phases of Huberman’s teacher development.

Therefore, we hope that this research will be a relevant factor in PIBID studies and generate new subsidies that can support public policies for teacher training and appreciation, in addition to understanding their processes, as well as the *ex post facto contributions of those involved*.

### 4 THEORETICAL AND METHODOLOGICAL FRAMEWORK

Basic education and teaching in Brazil have a history of professional devaluation over time. Career regulation did not always exist, and local elites built a culture of disrepute, making a counterpoint to bachelor's careers. Before the new LDB of 1996, which now requires teacher training exclusively through higher education, teacher training in the initial grades, for example, took place through intermediate-level courses and did not require university education. Regarding the first regulation of the teaching profession, there are reports that the first decree would have been created in 1940, as shown below:

> The teaching profession was regulated through Decree number 2028 of 1940, which determined that all educational establishments register and sign the professional portfolios of teachers, thus legitimizing their professionalization. From then on, the activity was regulated through professional registration at the Ministry of Labor (FERREIRA 1998 apud COSTA, 2012).

Even with the attempts to regulate and demand higher education for teachers, the devaluation and lack of prestige continued to hamper the interest of young people in teaching degree courses.

It is in this sense that the governmental emergency emerged in the area of teacher training and, in this first decade of the 21st century, there was the creation by the federal government of public policies that can value the teaching profession, in addition to initial training courses, but the neoliberal demands and, more recently, self-styled anarcho-capitalists from the Austrian School of Economics, try to deregulate professional practice in the sense of forming more professional reserve army and lowering teachers' salaries. If the profession is deregulated, anyone can teach, and then the reserve army is formed that works for ever lower wages. The discourse is that education should be free, unlike the positivist institutionalists who believe that quality lies in the regulation and selection of the best, thus paying higher salaries for teachers trained to be teachers, as are doctors, engineers and lawyers.

In this way, the Institutional Program for Scholarships for Initial Teaching (PIBID) was instituted, which is a relatively new program and was created by the Ministry of Education in 2007, but started to function effectively in 2009.
The administration and coordination of PIBID are the responsibility of CAPES, which even before the creation of this program was already active in granting scholarships and improving higher-level personnel. The operation of the program grants scholarships to undergraduate students so that, together with their teachers, they develop projects with didactic activities in partnership with state, municipal and federal schools.

This program allows students in the initial training process to have the opportunity to work with the school reality and make readings and interpretations of the country's educational routine and avoid the dichotomy between theory and practice, leading them to understand that the production of knowledge through school work.

According to Freitas (2010, p.09), “[...] the articulation between initiation to teaching and continuing education of teachers is, today, a demand of PIBID and the public school itself”.

The projects in which students and teachers participate and elaborate, enable forms of intervention and shared learning between the university and the practical educational world. Licentiate models prior to PIBID did not contemplate shared training throughout the training.

This can all serve as fundamental elements for the training of professionals who will work in teaching in the future, in addition to school reflection by already trained teachers, enabling mechanisms for better professional development and reflection on practices. Actions of this type are important and advantageous for teacher training.

According to Prado (2010, p.25), “[...] the collective work and continuous professional integration is also important. It needs to be supported with study, with reflection on practice, and more: the whole community needs to investigate issues relevant to the community itself. This is what helps, collaborates, builds new possibilities for working together.”

In this sense, professional teacher development is important for already trained teachers who work in basic education and depend on various issues, contexts and opportunities that arise either in the internal work environment, as in the school itself, or from external factors arising from policies public institutions such as PIBID and possible partnerships with universities. The excerpt below shows a little more about these factors and possibilities that arise in the lives of teachers that serve as a form of support in teaching professional development:

The teaching career is configured as a process of ongoing training and personal and professional development of the adult-teacher, which includes not only the knowledge and skills that he or she builds in training, but also the person he is, with all his beliefs, idiosyncrasies and life history, and the context in which the teaching activity is carried out (Hargreaves & Fulla, 1992 apud Gonçalves 2009).

Regarding the variables that have always hindered the training and professional development of Brazilian basic education teachers, the installation of a culture of devaluation of public schools and the exercise of teaching stands out. Therefore, an educational policy such as PIBID is extremely important, as
it is concerned with acting in improving the quality of education from its base to the training of teachers, also enabling the inclusion of teachers already trained so that they have the opportunity to acquire new motivations in their work and in their professional development and teaching improvement.

A policy such as PIBID makes it possible to invest in the quality and professional development of teachers who already work in basic education. Furthermore, it can promote higher quality education, initial and continuing teacher training and professional development.

5 THE FUNCTIONING OF PIBID: SCHOOL-UNIVERSITY RELATIONSHIP

At the time of the research, all areas were covered by PIBID notices: Degrees in Letters, Mathematics, Geography, Philosophy, Sociology, History, Physics, Chemistry, Biology, Science Teaching, Physical Education, Arts Education.

This program is well recognized due to its importance by the community involved, whose impacts tend to be extremely positive. The initial problems tend to be peculiar, while the basic education schools and their respective directorates also have their internal logics, hierarchies, rules and functionings.

However, any impact between inter-institutional relations serves as teaching learning for the teacher training process.

Among the impacts generated by the implementation of PIBID in schools and teaching courses, perhaps one of them is in the training curricula, which started to act and develop more activities in the practical field of teacher training, whose students can have more contact with the schools, that is, it goes beyond the traditional supervised internship.

With more experience lived in schools and in the development of projects during training, future teachers know more contexts, realities and diversities of schools and communities.

It is possible that there will be changes in the school culture itself, which would acquire a new perspective for the future, as basic education students may be more and better interested in the contents and want to know the university, the new ways of learning, all based on the projects, subprojects and activities of a more practical nature.

Therefore, currently, with the return on investments at the time of the PIBID (2007-2009), federal intervention in state and municipal education systems was carried out with the purpose of valuing the training of teachers and the teaching profession.

PIBID contributes to strengthening and enriching the pedagogical work that public schools have been developing in the country and is a way of creating greater contributions from the university to basic education, which go beyond the pure and traditional creation of school content, such as textbooks.

Therefore, the idea is to work on teacher training beyond the mandatory curriculum, that is, students must also know the school and the reality they will have to live with before graduation.

This training model enables more practices in the face of reality and everyday school life. Prospective teachers can understand the context and world of teaching work as well as the context of action.
Therefore, the student is encouraged from the beginning of university studies to get to know the schools, in order to feel the work environments that they will have to act.

The basic education teacher who already works at the school also guides students in the training process and not only university professors. It is a joint effort, as the basic education teacher better understands the reality of the school in which he works and its daily problems. It is the basic education teacher who also knows the application of contents according to the profile of each class, age group, in short, details, contexts and disputes that go beyond the learning taught in university benches, as it is a training that involves all the world of teaching work.

The methodological and didactic possibilities of each area of knowledge apply in different ways to different audiences, and this type of variable is difficult to assimilate and depends on undergraduate students knowing different points of view of the university.

PIBID makes it possible for a basic education teacher, a university professor and a degree student to dialogue around these issues that generate training and a more complete professional interpretation for future teachers.

In this way, the bridge promoted between university and school, the training of new teachers, the teaching of specific contents, will have more chances of being applied and understood, as there is a dialogue between the various people involved.

The involvement of basic education students is also a valuable possibility in the projects implemented, as it can generate motivation and interest in the areas worked and in scientific, technological knowledge and in social, economic and political issues. It is also possible to attract more young people to become future undergraduate students who start to convey an idea of greater appreciation.

Degrees are courses that need to attract new people interested in the causes of education and the introduction of a permanent public policy, as is the case of PIBID, it is possible to create the inverse culture of the current one, in which the teaching of basic education is more valued in the sense of professional status.

dilemmas and perspectives in debate

Table 1. Articles and research on PIBID SOURCE: PERIODICOS CAPES.

Regarding methodologies, Table 1 shows that the articles published at that time used questionnaires to students, interviews, description of subprojects, dialectical analysis of power and forces that coexist in school daily life. Other methodologies also involved analysis of narratives in portfolios, descriptive qualitative studies, theoretical studies and teaching learning. It also conducts exploratory-descriptive qualitative research Descriptive Textual Analysis of recorded ATD interviews.

The results found were presentations of some subprojects such as: ethnic-racial relations, science projects, forces of power, hegemony and against hegemony, on the role of the mathematics teacher to go beyond mathematics at school, oppression and exclusion at school, discoveries teacher, beginning teacher, professional development, reality shock of beginning teachers, contributions from PIBID, school routine, student essays, ethnographic research, anxieties and fears of teachers and students. It was also found inseparability in higher education between teaching research and extension.

Regarding the conclusions, Table 1 shows and discusses the conceptions of school knowledge and intercultural perspectives. Teaching knowledge. Emancipatory perspective. Knowledge produced in and by the school. Multiple knowledge and multiple relationships and training instances. University-School relationship and power relations. The PIBID as an inducing policy in teacher training. Investigate and analyze strategies and concepts of research and extension teaching experiences.

Table 2 presents several researches that were carried out on PIBID during several meetings of the ANPED (National Association for Research in Education).

The main topics and methods discussed in this period were Teacher Training, Life Stories, Reflective Assessment, Art and Education, Collaborative Learning, Distance Learning, Urban and Rural Educational Practices, Teacher Discontent, Teacher Identity, Teaching in Teaching Higher Education,
Mapping of Lattes Curriculum, Quality of Pedagogy Courses, Teacher Professionalization Continuing Education.

Among other methods used are qualitative research, document analysis, observation, questionnaires, case studies, document analysis, training research.

7 DIALOGUE WITH A FORMER GEOGRAPHY TEACHER PIBIDIAN

The conversation was between me and a Geography Professor, a former student of the Geography course at the Federal University of São Carlos, Sorocaba-SP campus, who did not want to be identified here. The interview was carried out on July 7, 2015. The interviewed professor was one of the first grantees of the PIBID program at the university, so he saw everything from the beginning, he saw the program being born on campus and in Brazil, with its implementation problems and its virtues.

I will describe here the interview with the Geography teacher, which revealed the local difficulties and the school-family relationship, school community, etc. the interviewee says:

“[..] so we investigated the relationship with the family, things like that, then this project to create an application number, it was already the second part of Pibid that was related to the application of the project.”

This application project mentioned was carried out by Pibid students so that they could get to know the reality of the school community, it was a kind of diagnosis.

This research was qualitative, through sampling and questionnaires.

I also asked about professional difficulties, but the answer was as follows:

“[..] no!.. about the school community... the family-teacher and management relationship... more or less... what the school community was like... it was more to introduce, right... introduce students to school…”

And I insisted: - and this part that you did, does it bring any learning to your work?

“[..] yes... we work on this issue of knowledge .. getting to know the school and getting to know its students.. this is very important.. if every school I go to has to know who the people are who they are managing.. who are the families that are in the schools and getting to know the students... so... there were people who had, the greatest learning I had was this. Knowing that each school is different from the other.”

“[..] I diagnose... study this reality... in this case, the reality I work in... is different from the public school... but even so, you need to know who it is... there is a school where I work... that students are more religious... they are more religious... there are students who are more liberal... so you also need to know who you are... so you can behave like a teacher... then you kick the ball out of there!”

The professor also clarified that he participated in all the planning of Pibid projects, that university professors were very open and even allowed the participation of professors from state schools to participate as well. That was one of my concerns in the research, whether the university wasn't arrogantly imposing the projects from the top down. But, according to this teacher interviewed, there was an opening for
participation. According to another interview I did, there is a case report of a school that was expelled from the program and that there was a big mess in the planning. However, since Pibid was in the implementation phase, according to this same interviewed professor, chaos was normal and served as an initial planning phase. I asked him if it would be the brainstorm phase and he agreed. The fact is that, for this Geography teacher who participated in this interview, Pibid served to learn about the creation of Projects at School.

See the excerpts below:

“ [...] we took a part at the beginning of everything from Pibid ... so it was chaos, right!... then, there was a planning chaos... on the part of the UFSCar faculty, right? ... and even understand what Pibid was .. because even the teachers themselves didn't know.”

“ [...] we were the first group of Pibid , so we... we there and everyone was learning, teachers and students... and the school too... so, the first part, it was the study of reality that lasted, in fact it was in three parts, this first one was the study of reality, where all groups researched the school... studied the reality of the school... each one with a theme... the curriculum, the other was... the other was about... teaching difficulties... mine was the school community... that was in the first six months... then I had to make a presentation to the rest of the class... which was a very long presentation... almost three hours... and from there they understood that the presentation should be timed... my group gave forty minutes... but there were 07 groups... so it was the meeting was very long... from then on, it was... started to organize... then in the second moment there was a new separation that was the didactic separation that started to work... the teaching part really began... undergraduate student within the school.

“ [...] learning to deal with the realities of the school there. each group went to one side... there was a group that played a game... there was a group that did a pre-college course... mine stayed with this workshop... then it was a workshop of interdisciplinary content... so much so that we even gave an article... that we launched an article in the Pibid book.

8 FINAL CONSIDERATIONS

Initially, we raised part of the research scenario in teacher training. We seek to understand the initiatives and measures, implemented from the institution of Pibid and REUNI due to the implementation of degrees at the Sorocaba campus of UFSCar, for initial and continuing training of teachers in Brazil. The discussions raised serve to guide the path taken in the elaboration of some programs and actions that guided the educational system until culminating with the creation of PIBID.

In this sense, we seek to discuss and gather information about teaching knowledge in professional practice. The discussions bring the PIBID to the scenario of teacher training, in addition to discussing aspects of professional training.

To understand if the collaborative formation between university and school made it possible for the graduates to perceive the challenges present in the school routine and the actions of planning and development of projects in the school, that is, the Pedagogy of Projects.

The theoretical-methodological debate revolves around the professional knowledge of teachers. For this, we cannot fail to discuss the process of professionalization of teachers. Nunes (2001) says that “research on training and teaching profession points to a review of the understanding of the teacher's pedagogical practice, which is taken as a mobilizer of professional knowledge.”
Thus, it considers that teachers, during their respective trajectories, build and rebuild their knowledge according to the need to use it, in their experiences, and in their training and professional paths (p. 27).

in relation to Tardif (2002), he points out that the knowledge of teachers must be understood in close relationship with their work environment and daily life. In this way, knowledge is at the service of work, in which we have two conceptual functions: the first aims to organically relate knowledge to the person who works and to his work, what he is and does, but also what he was and did; secondly, it indicates that the teacher's knowledge bears in itself the marks of his work, that it is not only used as a means of work, but is produced and shaped in and by work.

It is, therefore, a multidimensional work that incorporates elements related to the teacher's personal and professional identities.

ABSTRACT
This study aimed to experiment with several methodological procedures in the teaching in tongue maternal, with O intention in catch up one methodology what develop best O process in teaching-learning in this subject. For such The end, were applied various activities at the period in February The December in 2009 THE search in field he was performed with significant participation at the beginning with sixteen students remaining only nine; one gang mixed with students in five The fifteen years old in age, you which being both from the community and from the UEB Dom José Medeiros Delgado field school, school gives network municipal, placed on at the Neighborhood Rattlesnake. You several methods used has Link direct with O number of students at the course of the same. At various practices used has as result, what The orality in perspective sociolinguistics contributes significantly to the effectiveness of this teaching. So it's our understanding what The tongue oral it works as one tool facilitator at the teaching-learning in tongue maternal.

Keywords: Tongue maternal, orality, sociolinguistics.

1 INTRODUCTION
This research of experimental excellence aims to demonstrate through results of textual elaborations how essential it is to use orality in a perspective sociolinguistics in teaching tongue maternal.

The technique used was observation, carried out in a mixed class, with students from five to fifteen years of age, that is, from literacy to the seventh grade fundamental larger (We had students repeaters); in addition among these lay one student in fifteen years old with needs specials, as difficulty in locomotion, speaks andvision. It is worth mentioning that the objective was to develop the work only with students from fifth grade, as they had already been known in tutoring and the vast majority of this modality in teaching with difficulties in reading and writing.

THE sample of this study It is composed on one total in sixteen students, in school givesmunicipal network called UEB Dom José Medeiros Delgado, located at Rua da Tree, no. 12, Neighborhood Rattlesnake; choice it is done first for the will in contribute with my community, since the school is close to my residence in São Raimundo, and also of course, there are no obstacles on the part of the pedagogical coordination in carrying out such activity. However, it is important to emphasize that this research was
applied us finals in week, in start to the Saturdays and later passing only for you sundays, within the Open School Program, a project that aims to offer culture, sport, leisure, workshops in the schools public us finals in week, so being, no had other teacherin addition gives own researcher, then The same It is responsible for the schedule From contents, selection From texts, books and activities applied. All these with O objective in test methodologies with O intention in catch up one what develop best O process in language teaching/learning maternal.

From this point of view, it is observed that in Traditional Pedagogy 1 the teacher is the center of educational activity, conceived as an education professional "well prepared" for to transmit with "efficiency" a knowledge already systematized to students who, submitted to external discipline, are willing to living room in classroom in manner The converge your Warning for O teacher. O scope, in this perspective pedagogical, It is "learn" that one what O teacher-had as authority keeper of knowledge-transmits. (TARDELLI, 2002, p.19-20).

Initially, lasting a maximum of three months, and in these obtaining a posture traditional, with corrections graphics, without interaction teacher Student, as teacher the only holder of knowledge, so that he could test the behavior of the students and the result after this application, which is the study of Portuguese language emphasizing only The grammar normative with space only The writing.

At grammars normative try to be a mold. Only what O use what if does from them, in general, it is a seam in reverse. Instead of taking the mold to, with it, cut O tissue and later Mount O dress, you normativists, and O teaching traditional based on them, do O contrary: catch a use real and concrete gives tongue (a dress already ready) and they go measure and to evaluate that use for to see if he it is in wake up with O preset mold.

Grammarians use the standard language as a measure for all manifestations linguistic existing in Wow society, process This one executed in manner wrong, because in order to execute a linguistic rule and/or norm, it must start from the real and concrete language that permeates our social environment, which is oral, which despite not fulfilling the criteria established by a learned language according to grammarians, however this is the exact way for us to measure the uses of language, as soon as it is produced by not only a greater number, but also an existing number of speakers, which demonstrates that the tongue it's alive and It is active as well their representatives.

2 EXPLAINING APRODUCTIONS DRINKING THEORY SOCIOLINGUISTICS

In this first semester, such activities were worked on in 2009: on the February 14, 2009. 1st moment: teacher and student oral presentation; formulation in standards in coexistence; speak about O project (O what It is? for what It is?); 2nd time: to produce a text - Who am I? With The intention in to do one evaluation diagnosis from the students.
O text gives student outside adjusted, The word "very" for much, and request posteriorly what The student speak The word correctly, for what no write wrongspelling next time, a mistake that took a long time, it is worth mentioning what The student reached The stage in what if He gave emphasis The orality, and already only in mid of second semester managed to write the word according to grammar normative.

March 1, 2009. 1st moment: talk about the characteristics of the text narrative. 2nd moment: self-correct spelling parallel to the group. March 8th2009. 1st moment: talk about women's day. 2nd moment: talk about the woman in the present. Day 15 in March in 2009 1st time: dialogue about O poet Gonçalves Days(GD), in celebration of the day of poetry. 2nd moment: make a parody or stylization with the poem "Song of Exile" by GD
In student B’s text, the fluidity of the child with the textual genre (poem) is noted, leaving the learner free of monitoring, in this way he manifests a language significant for write your text, Where uses graphics, words, Name in people, things, animals, fruits and others that you know, this spontaneity is a characteristic of the genre, since it is a more subjective than objective writing, with a more connotative language than denotative, thus, seeking the literacy of this student, while approaching your context Social of this teaching formal, and these intertwined The your competence linguistics, will achieve a solid and effective structure of the language required in the environments in which preach for one reading and writing in according to the grammar rules.

illustrating it is vision (BAGNO, 2007, P. 181)

(...) rigid separation between speech and writing gave rise to the idea that writing has what to be ever most "far-fetched", most "elaborate" of what The speaks. So stem from serious problems at production...
textual in many people, what try to "writedifficult", using textual "crutches" that only serve to make the text heavy and inelegant.

In face of this objective, what It is to arrive The a domain gives competence communicativeof the student body, we can see the passage in the last stanza of the student's text, in which she says: "I am ending in speak: what with few words maranhão, I can him express." THEintention is to give space for the learner to expose their emotions, feelings, ways of seeing thelife, that through a more oral language genre can transmit their writing of manner most involute, pleasant, of that way, "dislodging in inside in me at words and the shapes that I bring in the mass of blood, I forget the world that surrounds me and I engulf myself in some poorly erased memory, and so I sometimes find writing that doesn't bored much." (BORTONI-RICARDO, 2004, P. 14). We notice what although in to be textwritten, The typology allows one language most oral, at the however It is in Wow understanding what none text It is uniform, or be, holds only features writing or oral, asdemonstrates The highlighted passage what permeates the tongue more far-fetched.

At the day 22 in March in 2009 1st time: to read O book: "One school so, I I wantfor me" by Elias José (São Paulo, FTD). 2nd moment: produce a text with the title "School It is..."

Student-C: "School It is..." (V J Ç V, 12 years, 6th year)

Dealing with topics that are part of the reality and need of students isurgent in our classes in tongue maternal, making so, at classes in tongue portugueseanly less boring, most contextualized and necessary no only for learn one tongue saidcorrect, most yea learn to live with O other, to be, realize the importance of this knowledge in their intellectual and personal formation, where they will use what facilitated his process as a social being.

Arguments Geraldi (at BAGNO, 2007 p. 225):

In the pedagogical process, it is not a matter of substituting one variety for another. (why one It is certain and other It is wrong etc.), but if treats in ramp up possibilities of new interactions of students
In lathe of that new posture in classes in tongue portuguese, in what inside of this communicative process, in which student and student, teacher and students interact orally, accepting your testimony about a certain subject, without derogatory attitudes or corrective of any linguistic events, but rather bringing together ideologies, in world, O what will facilitate your expression writing, already what has The possibility in manifest in according to your reality Social.

The analysis made of language as something real and concrete, makes us have the awareness that it needs to be expressed either orally or in writing according to the reality of its speakers/writers, and in this way we understand that "language is not a abstraction: on the contrary, it is as concrete as the same human beings of flesh and bone that use it and of which it is an integral part." (BAGNO; STUBBS; GAGNÉ, 2002, p.23). Of that manner, let's check The tongue as one entity live what holds at features historical, social, economic and geographic in their users.

March 29, 2009. 1st moment: talk about the textbook. 2nd moment: talk about the importance of each producing their own book, about what their first textbook. Comment on the first three sheets that anticipate the text (front cover, back cover and dedication sheet).

Day 5 in April in 2009. 1st time: sing O Hymn National. 2nd time: studying O hymn national Brazilian. 3rd time: to produce O text about O hymn national Brazilian.

Student-D: "O Hymn National Brazilian" (THE M S, 15 years, 6th/7th years old)

Second calvet (2002, p. 72):

talk in safety linguistics When, per reasons social varied, you speakers no if feel questioned in your mode in speak, When consider your standard The standard. To contrary, there is insecurity linguistics.
When you speakers consider your mode to speak little valuer and have in mind another model, most prestigious but that not practice.

Within the subject addressed, the student has a high degree of mastery of the subject "The Discovery of Brazil", so it manifests, unlike the other productions, a enormous linguistic security, and for that reason he exposes his language in a confident way, using their own orality as the correct, beautiful norm and not the one used by the minority, which is the holder of the "correct speech", since the same in this text makes several inferences of the subject that outside before discussed per All the gang.

April 12, 2009-Holiday-Easter Sunday. April 19th - correction orthographic... April 26, 2009. 1st moment: the researcher has a dialogue motivational with you students, per cause gives give up. 2nd time: reading shared from the book "Excuse me? Learning about living together" by Briam Moses and Mike Gordon(São Paulo, Scipione), but before reading, make the children remember situations where they felt good and others where they felt bad about the way they were treated. 3rd time: to do with what you students dramatize some situations of book. AND consequently speaking rules of coexistence, the need to use terms such as please, thank you, excuse me and others. May 1, 2009-holiday-day of worker. Day 3 in May in 2009 1st time: speak about Mother. 2nd time:

to argue The respect of paper in mother. Day 17 in May in 2009 1st time: to do reading in a group and successively interpreting the book "Serafina and the child who works" by Christina Porto; Yolanda Huzak; Jô Azevedo, São Paulo, Attica. 2nd moment: produce the text - Job Childish. Student-E: "Job Child" (RF J, 13 years, 6th year).

Learning the standard language should be a spontaneous, harmonious process, not tax per one little portion gives society (elite). The proportion what This one "contact with The tongue pattern if der by modality oral, very than the student You know it will be to you useful it's himif will recognize most easily
as interlocutor in situations in interaction in what That variety is naturally selected..." (RAMOS, 1997, p. 16). In this way, the student will have more autonomy in their textual production, the teacher is not the only able to transmit the standard language, but you can find it in your social group, your family.

We argue (BATHROOM; STUBBS; WON, 2002, p. 56):

(...) Brazilian schools, for the most part, until today are restricted to the practice of "essay", genre textual what only exists at school, no by having therefore none socio-communicative function relevant to the present and future life of the learner. THE practice traditional gives essay school impoverish drastically you goals of language teaching at school, as it despises all the different elements that contribute to the conditions of production of the written text: who writes, the what he writes, for who he writes, for what he writes, When and Where he writes, thisis at what situation cultural, Social, temporal and spatial.

Within the communicative interaction, writing fails to evidence what the speech evidence as, per example, The origin of this speaker, then The writing he leaves in side accentsand others, which are difficult to reach, especially when it comes to the elaborations of dissertation texts, which do not contribute much to the various events that students they are trailers, but yea only manifest one writing elaborate in tongue what It is something unreachable, The tongue "cultured". So being, It is important to develop at varied discursive situations of the learners, and through these various actions make the process of linguistic suitability for a given production situation, and from that way to reach different audiences and even find out which genre is most propensity, and so seek your maturation to different media of reading and writing.

May 24, 2009. 1st moment: read the reflective text "Man is the only animal what..." Speak about at differences in between O Khartoum, Cartoon, HQ and Strip. 2nd time:verify through the transparencies the use of the four texts. May 31, 2009. 1st time: comment, to inquire to the students The respect gives Fable. if already he heard speak in some, if you know. show the characteristics of a fable. 2nd moment: produce one fable.

F-Student: "THE cow and the Mouse" (Fs T, 13 years old, 6th year)

[Image of a handwritten story]
all speaker native in one tongue, in any grade in knowledge (formal or informal) knows how to speak your language. The styles interrelate depending on the degree of intimacy with the subject. It can also be said that, as this text has a characteristic most gives tongue oral what gives tongue writing, soon what demonstrates aspects as spontaneity, already what The student use terms in your daily, as "off", "nor He gave ball", "tacking", in a text written. This one space granted The orality does with what O processin writing if develop harmoniously and in form contextualized.

Corroborating with it is vision (ILARI; BASSO, 2006, p.181):

A long school tradition has got people used to watching writing and giving any less Warning The speaks, per that lots of people think what speaks gives same form whathe writes. At speaks, at people say stuff as "huh", "okeys", "I say", "technician", thinking what say "no It is", "you", "they said", "technician." ButThe difference in between O written and O spoken, go much in addition From phenomena what sayrespect to the form of words. Between the written and the spoken, there is a difference irreducible in planning.

The act of speaking, listening, reading and writing are processes that must be developed in parallel, these actions allowed what you students if develop without loss in yourdiscursive intention in whatever space is present. The vision they give to writing isat least contrary to our real needs in the classroom, which is the act of Communication, and for This one happen you apprentices need expose, speak your real linguistic repertoire, thus achieving suitability according to the various genres textual and The your language in use.

At the context, still of this search per one methodology what facilitate O apprenticeship at the teaching in tongue maternal, at attempts continued at the second semester2009, with increasing emphasis on students' orality, was not concerned with spelling correction, linguistic varieties were valued, speech spontaneity oral, less monitoring; however, it is worth noting that like every language teacher Portuguese is aware of the need for normative grammar in a scientific teaching center (The school), already what It is directed to knowledge formal; at the however, O teacher aware of this prerogative, he knows that he will teach it; however, without ceasing to fulfill this paper, will have one pleasant class, effective without the lost gives scientificity.

August 2nd, 2009. 1st moment: talk about the advertising text and make the reading a newspaper. 2nd moment: observe an advertisement in any means in information. Day 9 in August in 2009 1st time: dialogue about The importance of the father. 2nd moment: talk about the role of parents. August 16, 2009. 1st moment: ask students to talk about the performance of the character “Zeca” from the soap opera referent The teacher... As it is being The acting From students in relationship to the teachers.2nd moment: talk about
what it means to be a student. August 23, 2009. 1st moment: speak about The Wow culture folk. 2nd moment: comment on O our folklore.

August 30, 2009. 1st moment: talk about citizenship. 2nd moment: build the notion of citizenship. September 6th, 2009. 1st moment: free reading, as we were in the library each student chose a book to read. 2nd moment: each student comment on the choice of reading and their understanding of it. 13th of September 2009. 1st moment: ask students about their favorite drawing. 2nd moment: talk about your favorite drawing. September 20, 2009. 1st moment: speaks about The Internet. 2nd moment: type day text gives child and of the teacher.

September 27, 2009. 1st moment: read the book “Politics and citizenship in Maria Lucia of Rue Spider. 2nd time: understanding gives reading. Day 4October 2009–Book Fair Planning Day. October 11th 2009–meeting day with the parents of the children who were going to the Book Fair. 11th of October in 2009 1st and 2nd moments: re-elaboration of the texts late of some students.

October 18, 2009. 1st and 2nd moments: the same day 4. October 25, 2009 Canceled The going of children The Fair of Book per intermediate gives Secretary, for you students expose their books, but you same were with The researcher visit The exposure. November 1, 2009. 1st moment: talk about written language and language spoken. 2nd moment produce the text with free choice of title.

The student builds a text using some words that are explained in text, aiming to make the relationship between spoken and written language. when announcing such words, for example, when passing the noun lunch to the verb lunch, so the student builds her text, transforming the noun into a verb, then we study two grammatical classes without damage to the student’s sociolinguistic construction. In addition to prove that they have aspects of the oral language that are not seen in writing, such as "u carrêgu", "eu carrégu", since in the passage from oral to written such changes are not most of the time visible to the reader/interlocutor.
This closed vowel passage (noun) for open vowel (verb) is only perceptible orally, however until even those who claim to have the cultured language almost never pronounce it as it is.

THE This one respect illustrates bagno (2006, P. 150):

(…) the nouns on this list used a beautiful circumflex accent, called "differential accent", precisely because it helped to differentiate, in writing, the closed vowel (present in the names) of the open vowel (present in the stressed syllable from verbs correspondents).

(…). Except that in the last spelling reform, in 1971, this circumflex accent "fell out" (…) why if concluded what none speaker in Portuguese if would confuse to hour to pronounce these words.

Analyzing, however, this thought within the production in question is agreement that this process of change in writing is at least late, as it is something that along before it was confirmed as another norm of grammar, it was already being gift at tongue oralized of the speakers.

Day 13 in December in 2009 1st and 2nd moments: dialogue about at goals achieved. 3rd moment: produce a text with the title "What do I want to be when grow up" H-Student (JG s J, 11 years old, 4th year) Annex-H.

Seeking out aim at goals and expectations From students at straight Final gives search, he requested so that after having talked about the subject “What do I want to be When grow up?” argue together to the colleagues and later write such goals. At the student H’s text, she fails to accentuate words like “medica”, “secretaria” and others phenomena what are at majority of times impossible in be all registered, demonstrated inside in one tongue. At the however, This one example demonstrated no does with what The
student let in reach your purpose, what It is communicate, then although of observations pointed out to the same I managed to convey your message, any reader or interlocutor understands The reading/speaking depending The This one text It is remarkable highlight Thenon-existence of “a single non-standard variety, there are many, and saying how many is up to impossible, already what, as saw, for to define well one variety we have in to take in accounta number great in elements linguistic and social.” (BAGNO, 2006, p.158). Still, Valley highlight what This one aspect introduced It is observable only at tongue writing, While what at tongue oral these are spoken according require The standard "doctor", "secretary".

Day 20 in December in 2009-Closing. 1st time: to watch O movie "Looking for nemo". 2nd time: produce the text with title "Challenging The life".

Student I-Annex-I (P LB V, 5 years old. Children III)

O text of student I, per to have only five years old in age, and consequently O factin to have The predominance gives tongue oral in your context Social, O apprentice still does a use gives tongue according The your speaks, soon what looks O same it is making The transcription in yourspeaks in passages like these: “leaved”, “du”, “dele”...

Currently, there is a great disregard for oral practices in health establishments. formal education, which is contradictory, since literacy cannot use only writing formal on paper and leave orality aside, which is intertwined with the mechanisms in listen, speak and to read.

OK highlight what at first phase We had sixteen students; and When we entered the second, there were only nine; it is observed that the seven students who gave up, he was per lack in a method what admit your reality linguistics at living room inclassroom, generating so discomfort and low esteem From same to no get if express with safety. remaining only nine students and figuring out O method favorable to process in teaching-learning at subject tongue Portuguese; The leave in August he was given away great importance The orality, making up collections in texts oral through gives writing. it is believed that appreciation gives spoken language will do with what you students get in your speech O use most frequent
of style caution, soon what will have space for speak on one environment formal (school) your dialect classified in "non-standard", and This oneteaching will in this process assimilate spontaneously others dialects in use most frequent in this space. Of that mode, it is activity if will become any less poor and most effective.

Second (SOARES apud BAGNO; STUBBS; GAGNÉ, 2002, p.53):

(... none project educational he can if content simply in teach Theread and write (that is, in merely teaching literacy), but which must offer individuals, one turn literate, conditions for O literacy, this It is, conditions for O development each turn most intense and extensive of skills of writing and reading.

In the literacy process, the small learner is faced with two languages different, then inside of this new bond sociocultural, what It is The school, try him transmit a new language, as if the child did not know how to speak, which makes it difficult to development in writing as soon as they begin to reverse this educational work, as all human being first speaks to then write.

Still a another result gives observation, we have O what if Follow:

01 – It was noticed O teaching in tongue portuguese giving emphasis only The grammar

GRÁFICO 1

1900ral
1900ral

Source: Data From researchers (2020)

Giving emphasis only to study normative gives tongue portuguese, 44% From students dropped out of the study within three months. That is, of the 16 students, seven dropped out, remaining only nine, that is, 56% from the students.

02 – O teaching of tongue portuguese valuing the orality in perspective sociolinguistics

GRÁFICO 2

1900ral
16

Source: Data From researchers (2020)

With O teaching valuing only The grammar normative From 16 students (100%), seven gave up (44% From students) when still if valued only the grammar normative and nine remained from the valorization of orality in a sociolinguistics, that is, (56% of students) continued until O end of search.

As it moved from a methodology of teaching only the normative language to a methodology that emphasized orality, a change that what caused big ones difficulties for The action technique in a new method (The orality), already what later of various interventions at writing and The nonexistence in a process...
interactive communicative (listening, speaking, reading and writing), where students only wrote and only
the teacher spoke, so there was a lot of resistance on the part of the students for yes manifest in form
spontaneous, Natural. THE measure what, you apprentices were getting space for speak according your
varieties sociocommunicative, he was achieving success in textual productions, as soon as they were not
imposed a grammatical model, but rather accept its own linguistic variants. Even with non-differentiated
activities, it was possible to serve the vast majority of students, since the results expected they were in wake
up with The maturity cognitive From themselves; finding great difficulties in this non-application of
differentiated activities only around two children, the first fifteen years old with a motor disability, visual
and speech, this was one of the dropouts; and the second, because he was still in the level syllabic (this was
up until the end of search getting to develop O act of to read).

Thus, it is noted that within a number of sixteen students, the search with nine students. making sure,
what O teaching in tongue maternal in meaning only grammatical contributes for O failure school; already
at vision gives sociolinguistics, which evidenced the oral method in the teaching-learning of Brazilian
Portuguese, where the educators no cancel at varieties linguistic From students, of that manner getting O
school performance and decreasing the evasion of these apprentices.

3 SOME CONSIDERATIONS FINALS

Considering the teaching of the mother tongue still developed so as not to catch up O real objective
at the teaching in tongue, we have at gift search The demonstration in various concerns, misfits in this
process in teaching-learning.

Through the experimentation of two methodologies, more precisely the study normative gives
tongue portuguese and O apprenticeship in Wow tongue native in visionsociolinguistics. Given these two
aspects, it is observed that this teaching according to O first method quoted, no give space to real repertoire
linguistic from the students,
O what cause various concerns so much us students as us teachers, those ones often feeling unable to
perform their communicative competence and these if are in discontinuity in their performances.

So, it is necessary to seek new ways to minimize these disorders in the teaching of the mother
tongue, in this way, it was found in the sociolinguistic science scientific basis for such changes in wrong
attitudes and postures. Against of this current teaching of Portuguese in our Brazilian schools, it is at the
discretion of we, mother tongue teachers, look for alternatives so that we can minimize this problem, which
is the overvaluation of writing to the detriment of orality in the context of mother tongue teaching. And in
view of this diagnosis, we have as a result, that our real material in this teaching is the oral language itself
(linguistic competence) that the learner brings to the classroom and thus achieve our goal, which is the
improvement of the student in any communicative event, whether oral or written, and thus, to say that using
the oral language as a tool in language teaching maternal, he comes solve great part of these misfits in our
classes in tongue portuguese in Brazil.
REFERENCES

ABSTRACT
The definition of an investment portfolio usually depends on the elaboration of a strategy, which may or may not be successful in its results. Obviously, in this context, there will be an arrangement with the allocated assets, according to the idealized strategy. That said, naturally arises the need to have good instruments to assist in the configuration of this investment portfolio. To fulfill this purpose, Microsoft Excel’s Solver tool emerges as an interesting candidate to meet this demand, being able to facilitate the search for the best combination of financial assets, given a certain level of risk, or Beta. The objective of the study was to verify the feasibility of using the solver tool in the construction of an investment portfolio, seeking to reduce or even eliminate the diversifiable risk. This study is characterized as an experiment, of an exploratory nature, of a quantitative nature, and the results were obtained through simulation in Microsoft’s software. The information that guided the research was obtained from an electronic site, scientific article and newspaper. It was found that Solver was able to meet the objective, according to the adoption of the desired parameters, however, to
strengthen the understanding, it is still necessary to increase the set of financial assets, which have negative correlations with each other as a characteristic.

**Keywords**: Investment portfolio. Diversifiable risk. Solver.

1 INTRODUCTION

In current times, having computerized calculation instruments that offer some form of automation represents great value, given the speed and efficiency it can provide to the user. To this end, Microsoft (2021), through Excel, more specifically through the Solver feature, brings on its website that this supplement can be used to test hypotheses. Furthermore, it offers the possibility of finding an ideal value, according to the formula in a cell, and according to the restrictions and limits imposed on the values of other cells.

The solver add-in presents a structure capable of adapting to different variable calculation challenges. Among the various possibilities, within the financial field, the opportunity of application for investors, who operate mainly in the capital market, arises. It is through a thorough analysis of their investment portfolio that allocation decisions, or even the best combination of asset arrangement, corroborates the individual's need to obtain the appropriate instruments for such.

The central point of modern portfolio theory is the presentation of the efficient frontier concept, which advocates the use of diversification as a means of reducing the risk of a portfolio of financial assets (Markowitz, 1952). Assaf (2007), understands that there are three important phases to evaluate an investment portfolio, based on Markowitz's theory, which would be: Analysis of securities, Analysis of portfolios and Selection of portfolios. The last phase is based on the best combination of assets, within a perspective of maximizing investor satisfaction. Second, Markowitz (1952), satisfaction refers to the rational investor, who craves the lowest possible risk for a certain level of return.

The present research activity had experimental research as its methodology, and through a quantitative approach, we sought to answer about the feasibility of using Solver as a tool for allocating financial assets, according to theoretical assumptions.

2 OBJECTIVE

This work aims to demonstrate the use of the Solver tool of the Microsoft Excel Application for the application of the portfolio model, especially for the selection of portfolios for decision making.

3 METHODOLOGY

Given the existence of a portfolio of financial assets, it is important to understand that there will always be risks involved in the operation, whether to a lesser or greater degree of scale. Using Kerr's (2011) concept, the total risk can be divided into two parts: One of them is the diversifiable risk or specific risk, which can be eliminated. The other is called market risk, or systemic risk, which cannot be suppressed.
Given the rating of risk, it is important to clarify the logic that permeates this component, which can be observed by the indicator Beta (β). Arai (2015), similarly, explains that, with the market β equal to 1, as an example, and the other assets having β > 1, it is understood that these securities are riskier than the market, and the opposite is also true. Since the asset has a high β, there is greater sensitivity to systemic risk, therefore, it is recommended that risk-averse investors avoid them.

Also, the measurement of the risk of a portfolio of financial assets, according to Markowitz’s theory, brings the following risk equation, for two hypothetical assets: $\sigma_p = \sqrt{(w^2A \times \sigma^2A) + (w^2B \times \sigma^2B) + 2 \times wa \times wb \times COVA,B}$. In the notation, $\sigma_p$ is the risk, or standard deviation; $w$ is the weight of the asset, that is, the percentage share in relation to the total portfolio; $\sigma^2$ is the asset variance and COVA,B is the covariance of asset A with asset B. It follows that the insertion of more assets in an investment portfolio, given a risk and expected return, acting together, can demonstrate greater efficiency as opposed to an isolated investment (Sharpe, 1964).

For the experiment, the closing prices of four assets listed on B3 were collected, referring to the period from January to December 2018, namely, the Tickers: PETR4, SAPR4, VALE3 and CMIG4, as shown in Table 1. In addition, the IBOVESPA was defined as the Benchmark for comparing the variance of the set of selected assets.

4 RESULTS

The compilation of the result of the percentage variations of the sample variables can be verified through Table 2, being, therefore, the main database for the intended calculation, from the use of the solver tool. Therefore, Table 3 reproduces the β of the assets in the sample, with the aforementioned weights and the β of the portfolio still set to zero in the initial phase.

Once the β index of the variables is obtained, the solver tool is activated in the Microsoft Excel application. Figure 1 demonstrates step 1, that is, the initial activity with the configuration of the parameters and the necessary rules, to reach the desired objective. Note that the objective defined in “1”, represents the interest in establishing a portfolio of assets that contains neutrality in order to follow, on average, the fluctuation of its Benchmark. Finally, there is a restriction that conditions the weights of the assets to total 100% at the end of the allocated resources. This is necessary, since the total beta index depends on the product of each asset with that weight.
After defining the parameters and rules necessary for the calculation, there is the automated resolution of the calculation, which can be verified through Figure 2, which represents step 2. The result is automatically generated in the cells, which were initially zeroed.

![Figure 2: Solver Parameters Projection - Step 2](image)

As a result, during the simulation, it was found that as the portfolio combination is diversified, choosing assets that have different correlations between them, there is a percentage reduction in the exposure of assets with higher β, given the flexibility to be able to define the neutral β (β = 1). Thus, in this simulation, Solver offered the following ideal weights as a response, according to the previously generated indicators: 24% for PETR4, 28% for SAPR4, 32% for VALE3 and 16% for CMIG4.

5 FINAL CONSIDERATIONS

It was demonstrated through the application, that the modeling undertaken through the Solver tool, could enable the possibility of comparing different allocations of financial assets. This feature made it possible to establish a target in the objective field with relative ease, generating in turn the corresponding weight for each financial asset. However, it is important to note that the definition of the numeral in the objective field of the Solver application, reflects in a simplified way the investor profile. Once the index “1” is established in the β indicator of the investment portfolio, it must be agreed that this is an investment with a conservative profile. Therefore, this indicator ends up being flexible, within a perspective conceived by an investing agent, whether moderate, aggressive or even conservative. For future research, it is recommended to expand the set of assets in the sample, as well as to select only variables that present a
negative correlation with each other, in order to effectively observe the possibility of distributing the diversifiable risk in the asset portfolio.

ABSTRACT
ENADE is a mandatory assessment composed of the weighted average of the General Training grades - FG and Specific Components - CE that, in graduates of all graduations, measures performance in characteristics such as skills, content and professional competences about their courses. In this sense, in this work, the objective was to carry out a study with the general purpose of carrying out a statistical modeling in relation to the ENADE grade of the Mathematics course at the University of Pernambuco, identifying the patterns of variation of the grade obtained by the course and, after that, through simple regression analysis, predict values of future exam scores of these courses. For this, the existing relationships between two variables (grades and years) were described using a simple linear regression analysis, taking into account the regression line, Pearson's Correlation Coefficient, the Determination and Analysis of Waste. From the observed results, it was concluded that the Enade grades tend to decrease over the years, since there is a negative linear relationship between the variables, this occurs even with all the CE grades and the Garanhuns grade in FG with a positive linear relationship.

Keywords: Enade; Simple Linear Regression; Teaching.

1 INTRODUCTION
In 1995, the National Course Examination (ENC) was created, called Provão, which, based on the evaluation of higher education courses and their results, had as main objective to obtain data that would influence the formulation of actions and improvements for Brazilian higher education. The mathematics course participated in the ENC from 1998 onwards. In 2004, a new National Higher Education Assessment System (SINAES) was implemented, with the same objectives as the Provão, but with the implementation of the National Student Performance Exam ( ENADE), being published for mathematics students only in 2005.

According to the Instituto Nacional de Estudos e Pesquisas Educacionais Anísio Teixeira (2005), ENADE is a mandatory assessment that, in graduates of all degrees, measures performance in
characteristics such as skills, content and professional competences about their courses and is carried out in periods not exceeding three years. It uses as instruments a test about the course and a socioeconomic questionnaire to obtain statistics on higher education institutions (HEIs) and students. These statistics are used to, from the leveling of performance, create public policies in favor of improvements to the quality and services in education.

The research in question has the general purpose of carrying out a statistical modeling in relation to the ENADE grade (composed of the weighted average of the General Training grades - FG and Specific Components - CE) of the Mathematics course at the University of Pernambuco - Campus Garanhuns, Nazaré da Mata e Petrolina, as specific objectives, aims to identify the patterns of variation of the grade obtained by the course and, after that, through simple regression analysis, predict values of the future grades of these courses in the exam.

2 METHODOLOGY

In this work, the regression analysis aims to describe, through a mathematical model, the existing relationships between two or more variables from n observations of these variables and, in this way, predict future values of a (dependent) variable, that is, with on the basis of one or more variables explaining future potential.

The linear regression model, according to Krajewski, Ritzman and Malhotra (2009), is one of the most known and used causal models, which consists of a variable called dependent being related to one or more independent variables by a linear equation. It can be said in technical language that the regression line minimizes squared deviations from the actual data. To obtain the equation of the line, simply apply the following equation:

\[ y = a + bx \]

In the equation, “y” refers to the dependent variable and “x” to the independent variable. The “a” represents the intersection of the line on the y-axis and the slope of the line. This formula establishes the equation that identifies the effect of the forecast variable (independent variable) on the demand for the product under analysis (dependent variable), this is because it seeks to forecast the demand for a certain item based on the forecast of another variable that is related to such item. In other words, it aims to find a linear prediction equation so that the sum of the squares of the prediction errors (beta) is the minimum possible. Below is a model where a regression line is formed in the Cartesian system, note that this line is calculated through the points constituted by the dependent and independent variables that are under analysis using the least squares method (Figure 1) :

---

Case Study: Forecast in ENADE for the Mathematics Course at the University of Pernambuco through simple linear regression analysis

---
In addition, the equations for obtaining the coefficients a and b that constitute the linear regression models, as described by Gaither and Frazier (2006), are described below (Figure 2):

According to the figures presented above, the calculation of the coefficients a and b is intended to minimize the sum of squared deviations of the real data from the graph line. To exemplify what has been said, the linear regression model will be calculated for the data set analyzed during the results of this work, which is composed of the ENADE scores in the city of Garanhuns (Table 1 and Figure 3):

Source: authors (2019).

Where:

As \( y = a + bx \), from the information obtained, we have that the equation of the line will be \( y = 150.7 \).
– 0.0735x, through which the value of the grades for the year 2020 was calculated, with 2020 being the variable x and the grade the variable y. In addition to the regression line, other deterministic factors that influence the parameters of the model were taken into account, in this case, we have the Pearson Correlation Coefficient, the Determination Coefficient and the Residual Analysis, see how each one was obtained:

**Pearson's Correlation Coefficient (r):** the study of correlation aims to measure and evaluate the degree of relationship existing between two or more variables in the hope that any relationship found can be used to make estimates or predictions of one of the variables that is, it is the number that summarizes the degree of relationship between the dependent variable and one or more independent variables. This degree of correlation varies on a scale from -1 to 1 (Figure 4) and is obtained through the dispositions of the points referring to the independent variables and the dependent variable in a straight line or a plane. 1 (Figure 4):

\[
\begin{align*}
\text{Pearson's Correlation Coefficient (r):} & \quad r = \frac{n\Sigma xy - \Sigma x \Sigma y}{\sqrt{n\Sigma x^2 - (\Sigma x)^2} \cdot n\Sigma y^2 - (\Sigma y)^2} \\
\text{As the resulting r value was approximately } -0.99, & \quad \text{we assumed a very strong negative correlation, where as the values of the independent variable increase, the values of the dependent variable decrease.}
\end{align*}
\]

**Determination Coefficient (R²):** this coefficient measures the relationship between the dependent variable and the independent variables. Indicating how many percent the variation explained by the regression represents of the total variation (population). When:

- **R² = 1:** All observed points lie exactly on the regression line (perfect fit), that is, the y variations are 100% explained by the variation of x's through the specified function, with no deviations around the estimated function.
- **R² = 0:** It is concluded that the variations of y are exclusively random and the introduction of the variables x's in the model will not incorporate any information about the variations of y. To exemplify the calculation of R² we apply the values recorded in table 1 (Figure 5):

![Figure 4. Pearson applied to the values in table 1](source: authors (2019)).
The coefficient of determination obtained indicates that approximately 98% of the dependent variables are explained by the generated regression model.

**Residual Analysis**: Residual analysis plays a fundamental role in evaluating the fit of a simple linear regression model, investigating the model's adequacy regarding basic assumptions, as well as normality, error independence, homoscedasticity, linear relationship of X and Y and lack of fit. In addition to the significance and adequacy tests, residual analysis complements the list of procedures that must be performed after adjusting any model (Messeti, 2013). The residuals of the values visualized in table 1 were described below (table 2):

<table>
<thead>
<tr>
<th>Garanhuns</th>
<th>Y previsto (através da reta de regressão)</th>
<th>Residuos (diferença entre o e calculado e o e observado)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>2,897833</td>
<td>-0,01883</td>
</tr>
<tr>
<td>2</td>
<td>2,677333</td>
<td>0,037667</td>
</tr>
<tr>
<td>3</td>
<td>2,456833</td>
<td>-0,01883</td>
</tr>
</tbody>
</table>

Note that the residual values are small, which helps to understand the quality of the model, in addition to having constant variance, without outliers or influential points.

**3 RESULTS AND DISCUSSION**

The National Student Performance Examination (Enade), as is already known, is composed of the weighted average of the General Training (FG) and Specific Components (CE) grades. The observed grades were organized by city (Garanhuns, Nazaré da Mata and Petrolina), Categories (Enade, General Formation or Specific Components) and the years in which the grades were obtained, seeking, through simple linear regression, to predict the grades that will be obtained by the Mathematics Degree courses at the University of Pernambuco in the year 2020 (not yet disclosed).

**Set 1 of Graphs:** Enade grades in the years 2011, 2014 and 2017 and expected grades for the year 2020 according to the regression model in the cities of Garanhuns, Nazaré da Mata and Petrolina.

The information described in this set 1 of graphs was used to calculate the linear regression models for each city in the general notes of ENADE. In set 2 of graphs, information about the city of Garanhuns is described:

**Set 2 of Graphics.** Scatter diagram and residual plotting of Enade grades in the city of Garanhuns.

We note that in the city of Garanhuns in all variables as X increases Y decreases, therefore, there is a negative linear relationship where Pearson's Correlation Coefficient (r) is equal to -0.98923 (Set 2 of Graphs), characterizing a correlation very strong. The regression line is given by the equation $y = -0.0735x + 150.71$, where the Coefficient of Determination (R²) is equal to 0.9786, that is, the line explains almost 100% of the observed values. The residuals between the observed and predicted scores are almost equal, ranging between 0.05 and -0.05. The data above suggest that the relationship between the variables analyzed is strong, as a consequence, it is expected that the Enade score in Garanhuns in 2020 will be even lower.
than in previous years. In set 3 of graphs, the information for the city of Nazaré da Mata is described:

In Nazaré da Mata we have that, on average, X increases and Y decreases, \( r \) is equal to \(-0.81034\), indicating a strong correlation, the equation of the regression line is \( y = -0.0845x + 172.32 \) and \( R^2 = 0.6566 \), being then approximately 65% how much the regression model can explain the observed values. As for residues, they do not vary much, they are not greater than 0.2 or less than 0.3, so the predicted grade for 2020 can be taken into account, that is, the data suggest that in the year 2020 the grade will be again the smallest in the data set. In set 4 of graphs, information for the city of Petrolina is described:

In the city of Petrolina, on average, while X grows Y decreases, unlike other campuses, we have that the correlation between the variables that were analyzed is almost negligible, this is because \( r \) is equal to \(-0.13568\). The Regression Line is given by the equation \( y = -0.0208x + 43.686 \) and the Determination Coefficient is 0.0184, also very low, meaning that the line does not explain even 1% of the observed values, this situation shows us that practically there is no relationship between the variables and, therefore, in the predicted grade for the year 2020, there is a high chance that there will be a greater residue of the observed grade for the calculated grade.

Source: Authors (2019).

The information described in this set 5 of graphs was used to perform the calculations of linear regression models for each city in the General Training notes, the data that are described in set 6 of graphs below are also summarized in table 3:

Table 3. Regression data for cities in General Training notes

<table>

</tbody>
</table>

Source: authors (2019)
Observe the information, in the General Formation (FG) notes we noticed that where there is a stronger correlation is in Petrolina, classified as very strong, followed by Garanhuns, with a moderate correlation and Nazaré da Mata, which has a negligible correlation, this reflects in the Coefficients of Determination, where the regression line, in Nazaré da Mata, explains less than 1% of the observed data, followed by Garanhuns, with 31% and Petrolina with 96%. As for residual analysis (set 7 of graphs):

Note that the residues, in Garanhuns, vary considerably from each other. Nazaré da Mata, in turn, although it has a negligible correlation between the variables, does not have very distinct residues, whereas
Petrolina naturally has the smallest residues, with the majority reaching almost zero.

Based on the observations, it can be seen that the analysis of the linear relationship between the two variables (year and grade FG) in the three cities suggests that Petrolina has a direct relationship of cause and effect between the variables, therefore, it is expected that its lowest grade in General Training or in 2020, in Nazaré there is no considerable linear relationship, with the predicted grade being more uncertain, while Garanhuns, if the value obtained is close to what was predicted, will reach its second highest grade compared to previous years.

The information described in this set 8 of graphs was used to perform the linear regression model calculations for each city in the Specific Components notes, the data that are described in the sets 9 of graphs below are also summarized in table 4:
In the city of Garanhuns, when analyzing the grades, we noticed that, on average, if X grows Y grows, with the exception of one occasion between 2011 and 2014, this leaves us with a positive linear correlation where the Pearson correlation coefficient has a value close to one, which leads to a strong correlation, a similar situation occurs with Nazaré da Mata, which obtains a strong correlation, whereas Petrolina presents a negligible correlation. As for the Determination Coefficient (R2), from its analysis, it is noted that the regression line explains less than 1% of the values observed in the city of Petrolina, in Nazaré da Mata this value is approximately 70% and in Garanhuns 87%.

Also by analyzing the set of graphs 9, we saw that the scores predicted for the year 2020 in Garanhuns and Nazaré have a strong cause and effect relationship, with the highest ever achieved by both, which definitely does not occur in Petrolina, which, in addition to its values have an almost null linear relationship, it would only reach its third highest score if what was predicted happened. Now look at the residuals (set 10 of graphs):
Both the Garanhuns and Nazaré residuals do not have a large variance between them, in both cities the lowest value is no more than -4 and the highest value is no more than 3, having, in addition, several residues with almost equal values. Petrolina, in turn, has a much greater variation, with residuals between -8 and 7 and quite distinct from each other.

4 FINAL CONSIDERATIONS

With the accomplishment of this work, it was noticed that the data obtained from the application of the proposed method revealed the value of the predicted grades for the years 2020, in addition, through the Linear Correlation Coefficient it was possible to quantify the correlations as strong or weak, through the Determination Coefficient, the proportion of the variability of the predicted values for pata y was explained, which is explained by the simple linear regression model in each case, and, finally, through the Residual Analysis, the basic assumptions of each were confirmed. model.

At the end of the study, it was found, regarding the Enade scores, that the cities that had a good relationship between the variables studied have as supposed scores for the year 2020 a lower value than all the previous ones, that is, the score tends to decrease each year, the same happens with the General Education grade in Petrolina. The General Training grade in Garanhuns, which has a moderate correlation, tends to grow and expects to reach its second highest grade in 2020.

As for the scores in Specific Components, the two cities that have good correlation achieve their highest scores in 2020, that is, the CE score tends to grow over the years. Finally, of the nine analyzes carried out, the three that obtained a weak or insignificant correlation (Enade de Petrolina, FG de Nazaré da Mata and CE de Petrolina) naturally have a large variation in their scores, without a specific standard, consequently, the Predicted notes for the year 2020 have the same characteristic.

For future work, it is suggested to use simple linear regression for an analysis of ENADE in a specific municipality in the state in other undergraduate or Bachelor's degrees at the University of Pernambuco.

ABSTRACT
According to the literature, environmental, demographic and socioeconomic factors have contributed to the maintenance of high rates of dengue cases in Ceará. In addition, the introduction of viruses such as Chikungunya and Zika in 2014 worsened the endemic scenario. Thus, in view of the favourable conditions for endemics and the permanent need for new studies to understand the dynamic role of arbovirus infections in Ceará, the objective of this study was to evaluate factors related to the highest incidence of arboviroses in Ceará cities in 2021. This is a study based on data released by the Health Secretariat of the Government of the State of Ceará (SESA). Among the 184 municipalities of Ceará, the ten cities with higher and lower incidence of arboviroses transmitted by Aedes aegypti in 2021 were selected, generating two groups and, therefore, the variables population density, rainfall, temperature, human development index (HDI), education, income, infant mortality, health facility, number of doctors, availability of drinking water, sanitation and household waste collection were analyzed. The data collected were analyzed in the PRIZMA programme. The results revealed that the ten municipalities with the highest incidence of cases of arbovirosis present significantly higher population concentration, average and minimum temperatures, HDI, income, infant mortality, number of health establishments, number of physicians, sanitation rate, and solid waste collection when compared with the ten municipalities with the lowest incidence. However, there was no difference between the groups when maximum temperature and rainfall were evaluated. Therefore, we suggest that agencies and secretariats related to dengue control, as well as the community intensify their actions not only during the rainy season, but also act throughout the year, since other factors contribute to the increase in cases of arbovirosis in the cities of Ceará.
Principles and Concepts for development in nowadays society: **Climatic and sociodemographic factors stand out in the cities of Ceará with the highest incidence of arboviruses transmitted by Aedes aegypti**

Keywords: Dengue; Arboviruses; Aedes aegypti; Ceará.

1 INTRODUCTION

At arboviruses, taken as a problem in health public worldwide emerging (Vilibic-Cavlek et al., 2021), represent infections viral propagated for the sting in arthropods hematophagous, especially O Aedes aegypti and Aedes albopictus (Porto et al., 2019). In addition to encephalitis and West Nile viruses, among the arboviruses of medically important, dengue virus (DENV), Chikungunya (CHIKV) and Zika (ZIKV) virus (Vilibic-Cavlek et al., 2021). Those, in addition of virus gives fever Yellow, present, as vector primary, O ae. aegypti (Olson et al., 2021).

According to the literature, about half of the world population lives in urban arbovirus risk areas. transmitted by Ae. Aegypti (Olson et al., 2021). In particular, DENV is present in 123 countries, with around 3.9 billion in individuals in risk in infection and attacking about 390 millions in subjects (world Health Organization – WHO, 2022). For O CHIKV, O number in cases gives illness registered annually at the world It is in lathe in 3 The 5 million (Sharif et al., 2021).

At the Brazil, you records show The occurrence, us last years old, in fur any less nine arbovirus promoters in infection, mainly those of the Flaviviridae family (DENV and ZIKV) and Togaviridae (Porto et al., 2019). For CHIKV, the first confirmed cases in the country occurred in 2014 (Porto et al., 2019). In 2021, the incidence rates in Brazil of dengue, Chikungunya and Zika were respectively 250.7, 44.9 and 2.9 cases per 100,000 inhabitants. In particular, in that year, in the Ceará, Those numbers corresponded The 389.6, 14.2 and 4.2 cases per 100 thousand population, respectively (System in Information in grievances in Notification - SINAN, 2022).

You challenges and at problematic at the confrontation of arboviruses transmitted fur ae. aegypti second Brazil (2009) permeate the organization of dengue prevention and control actions, the classification of risks in health services, the promotion gives assistance proper to patient, O Enhancement gives surveillance epidemiological, ensuring notification, investigation of cases and monitoring of viral serotypes, always in a timely manner, standardization of supplies necessary strategies, the definition of strategies to reduce the force of transmission of the disease, through the control of the vector and its breeding grounds, support for the training of health professionals and managers, the systematization of mobilization and communication, improvement of the analysis of the epidemiological situation and organization of the care network for guide decision-making, strengthening the articulation of different areas and services, aiming at the integrality of actions for confrontation gives dengue. Per The end, O reinforcement at actions in articulation intersectoral in all at spheres in management.

In historical terms, in Ceará, the first description of arboviruses, as well as their transmitting agent, occurred in 1851, the year in which there was an epidemic of yellow fever transmitted by the mosquito Ae. aegypti (Cavalcanti et al., 2018). After the control of this epidemic, in August 1986, the state again registered new cases of arboviruses (Monteiro et al., 2019).
In this period, were notified countless cases in dengue, you which if propagated From centers urban for at peripheries and zones rural, affecting almost all you counties Ceará At the same time, in 2015, were found two new arbovirus, CHIKV and ZIKV (Cavalcanti et al., 2018). Currently, in the epidemic scenario of Ceará, there are four serotypes of virus gives dengue, called in DENV-1, DENV-2, DENV-3 and DENV-4, in addition of CHIKV and ZIKV.

With regard to risk factors for arboviruses, the literature mentions demographic, environmental and meteorological conditions, as well as socioeconomic conditions and urbanization (Oloson et al., 2021). Among the environmental factors, high rainfall, high average and maximum temperature, high relative humidity and tropical and subtropical climates are cited. (Silva et al., 2020). As for the socioeconomic and demographic aspects, they include the reduced per capita income and schooling rate, high population density, disorderly population growth and difficult access to water drinking, sanitation basic, service in health and home (Alves; Araújo; Silva, 2021).

In Ceará, environmental, socioeconomic and sociodemographic factors are responsible for the persistence of the state as an epidemic region for arboviruses (Brazilian Institute of Geography and Statistics – IBGE, 2020, Institute of Research and Strategy economic of Ceará – IPECE, 2021). In fact, you studies demonstrate one Association in between Those factors and you cases of dengue or estado (Morais; Farias, 2021; Sousa et al., 2017; Carabali et al., 2021; MacCormack-Gelles et al., 2018; do Carmo et al., 2020, Braga etc etc., 2019).

However, works investigating Chikungunya or Zika, as well as arboviruses in general, are limited, since notification of these diseases started in the state in 2015 (Braga et al., 2019; Cavalcanti et al., 2019; Silva et al., 2020).

Given the importance that arboviruses assume on the world stage and the need for recent studies that portray their risk factors in the state of Ceará, especially the climatic and sociodemographic ones, this research aimed to investigate The influence of those factors us counties ceará with larger or smaller incidence of those illnesses at the year in 2021.

2 METHODOLOGY

2.1 DRAWING OF STUDY, PLACE AND POPULATION

It is a study epidemiological observational analytical driven in state of Ceará, O third most population of the Northeast Region of Brazil, consisting of 184 municipalities, spread over an area of 148,894,442 km2 (IPACE, 2021; IBGE, 2020). In terms demographics, in 2021, The I estimated in your population and density consisted in 9,240,580 population and 62.06 inhab./km2, respectively (IPACE, 2021).

Your diversity landscape if characterizes mainly per areas country people marked for the semi-arid justifying the predominance of a hot tropical semi-arid climate, in addition to mountainous regions, with better climatic conditions, and coastal, characterized per temperatures most moderate and bigger fees
rainfall (IPACE, 2020).

In the economic context, according to Lustoza et al. (2019), the mesoregions of Northwest Cearense, Jaguaripe and Norte Cearense stood out in 2015 for their agricultural activity, while the Metropolitan Mesoregion of Fortaleza stood out, stood out for the development of the sector in trade and construction.

2.1 PERIOD OF STUDY AND CRITERIA IN INCLUSION AND EXCLUSION

Of the 184 municipalities, ten municipalities with the highest incidence of arboviruses in 2021 were included in the study, equal to among those with the lowest incidence, according to the epidemiological bulletin of arboviruses (Table 1). therefore, incidence data, number of confirmed cases, number of reported cases and confirmation rate, respectively dengue, Chikungunya and Zika/control vector, second O County in residence, Ceará, 2021 (Table two).

2.3 COLLECT IN DICE

Data collection was carried out from information on the incidence of arboviruses in the municipalities of the state of Ceará, published at the report card epidemiological in arboviruses (dengue, Chikungunya and Zika) gives Secretary in Health of Government of State of Ceará (SESA), in the period of January to December 2021.

You Dice referents The density demographic and Index in Development Human (HDI) were extracted from census from the IBGE 2010. As for the information on temperature and rainfall, these came from the Climatempo website, available in the website https://www.climatempo.com.br/. Analysis From Dice

The data collected were on the website: https://www.saude.ce.gov.br/download/boletins/, tabulated and organized in the Microsoft office excel 2019 and analyzed at the program GraphPad Prism, version 6. You Dice were espresso as frequency absolute, mean and standard error of the mean. For comparison between groups, Analysis of Variance (ANOVA) was applied. Then by the test in Tukey. admitted P<0.05.

2.5 ASPECTS ETHICAL

The project was not evaluated by the Ethics Committee in Research with Human Beings, as it is a research, whose data are freely accessible and without patient identification, according to the Resolution of the National Health Council in 466/2012 (Brazil, 2012). Nonetheless, all you precepts ethical were followed.

3 RESULTS

As observed in Table 3, the population density of the ten municipalities in Ceará with the highest incidence of cases in arboviruses he was significantly higher of what The From ten counties in smaller incidence (45.05 ± 8.110 vs. 27.14 ± 4.490 inhabit/km2, p= 0.0393).

With regard to the HDI, the data showed a significantly higher value among the ten municipalities Ceará with the highest incidence of arbovirus cases and the ten with the lowest incidence (0.6374 ± 0.006348 vs 0.5940 ± 0.004650, p<0.0001).

As for education, there was no significant difference between the value recorded among the ten municipalities in Ceará with highest incidence of arbovirus cases and the ten with the lowest incidence in relation to the schooling rate from 6 to 14 years of age. age (98.01 ± 0.2442 vs 97.48 ± 0.3479, p=0.1142), as well as IDEB scores for the initial years (6.470 ± 0.1106 vs. 6.380 ± 0.3684, p=0.4088) and finals (5,530 ± 0.1248 vs. 5,370 ± 0.3052, p=0.3167) of teaching fundamental gives Network public.

However, for the economy, the ten municipalities with the highest incidence of arbovirus cases had GDP per capita and salary monthly average of formal workers significantly higher When compared at ten municipalities with lower incidence, respectively (12,560 ± 1207 vs 8,200 ± 233.7, p=0.0012) and (1,720 ± 0.06799 vs 1,560 ± 0.06182, p=0.0494). In addition, the percentage of the population with a nominal monthly per capita income of up to 1/2 salary minimum was significantly lower when compared to the ten municipalities with the lowest incidence (50.82 ± 1.314 vs 55.81 ± 0.7910, p=0.0022).

In health, Table 4, the ten municipalities with the highest incidence of arbovirus cases presented numbers of SUS health establishments and doctors per 1,000 inhabitants significantly higher when compared to the ten municipalities with the lowest incidence, respectively (21.80 ± 5.599 vs 10.90 ± 1.841, p=0.0404) and (1,003 ± 0.1130 vs 0.7633 ± 0.05749, p=0.0383). Still, The rate in mortality childish he was significantly high When compared to the ten counties in smaller incidence (14.95 ± 2.650 vs. 8,986 ± 1,834, p=0.0491).

As for the maximum temperature, Table 5, there was no significant difference between the value recorded between the ten counties ceará with larger incidence in cases in arboviruses and you ten in smaller incidence (31.83 ± 0.4886°C vs. 31.90 ± 0.3339°C, p=0.4593). However, for the average temperature, the ten municipalities with the highest incidence of arboviruses showed a significantly higher value when compared to the ten municipalities with the lowest incidence (27.92 ± 0.2204°C vs 27.06 ± 0.3018°C, p=0.0186). The same was observed between the minimum temperature of the ten municipalities with the highest incidence and you ten counties in smaller incidence (23.78 ± 0.2392°C vs. 22.22 ± 0.2719°C, p=0.0004).

*Incidence in arboviruses per 100,000 population; waste household (RDO), pasta collected total (kg/inhabitant/day). Source: Author himself

For rainfall, the average per capita water consumption and total water service, the ten municipalities in Ceará with the highest incidence of arbovirus cases showed values similar to those obtained by the ten municipalities of lower incidence, respectively, for rainfall (782.7 ± 55.25 vs 841.6 ± 24.95, p=0.1816), the average consumption per water capita (144.8 ± 7.038 vs 136.6 ± 5.586, p=0.1901) and total water service (41.83 ± 5.535 vs 34.10 ± 3.358, p=0.1307). Nonetheless, with relationship to the waste, you ten counties
with larger incidence in cases in arboviruses presented total sewage service in % and coverage rate of household waste collection (RDO) significantly higher when compared to the ten municipalities with the lowest incidence, respectively (25.84 ± 10.84 vs 6.340 ± 1.707, p=0.0301) and (84.33 ± 5,681 vs. 58.30 ± 3,579, p=0.0014). At the however, The pasta collected total (kg/inhabitant/day) he was significantly bottom When compared to the ten counties in smaller incidence (0.8260 ± 0.1149 vs. 1,313 ± 0.2222, p=0.0256).

4 DISCUSSION

Population density is an essential parameter when studying arbovirus epidemics, as high rates of incidence gives illness generally are observed in regions most populous.

In these places, the breeding, proliferation and transmission of these infections are more frequent due to the disorderly growth of urban centers, informal settlements and slums, places where living conditions housing, health, education and sanitation are precarious. As a result, the development of breeding grounds for the mosquito and O larger Contagion, one turn what you individuals are more next From foci in streaming (Cato, 2011, Chahad- Ehlers et al., 2013, kind et al., 2013, Rodrigues et al., 2016, barcellos et al., 2014).

In this research, the lower population density was associated to a lower incidence of arboviruses among evaluated municipalities. This finding can be easily understood based on the above. although not here analyzed, according to do Carmo et al. (2020), densely populated municipalities have an incidence rate of arboviruses almost 2 times bigger of what those ones with any less population.

The human and municipal development index takes into account three factors: life expectancy, income and literacy index. In Brazil, these variables are taken into account when calculating the HDI and IDHM, and they are generally related to a higher incidence of dengue cases. According to some studies, low purchasing power and low index in literacy found in many different regions Brazilian are predictive gives incidence in dengue (OK et al., 2015; Baia, 2014; de Castro et al., 2018, Rodrigues et al., 2016; Arantes, 2017; Ferreira, 2017; Pinto et al., 2016). In this way, the factor socioeconomic he can to be determinant for The Epidemic in arboviruses. Nonetheless, some studies has revealed positive correlations between the HDI and the number of dengue cases, between the incidence rates of chikungunya fever and the MHDI, as well as positive correlations between the incidence rate of Zika and MHDI (Costa et al., 2018, de Castro et al., 2018). Therefore, there are records in the literature of a high incidence of arboviruses both in areas with low MHDI and in those regions. in IDHM high.

Our results revealed a high IDHM in the municipalities with the highest incidence of arboviruses, thus corroborating with other studies that showed a greater number of arbovirus cases in cities with higher IDHM. One possible justification for the data shown above is that the high IDHM reflects the urbanization process, the economic development, improved infrastructure and greater access to health services and doctors, as well as contributing to the higher notification rate of arbovirus cases. On the other hand, the high IDHM also favors the multiplication From foci in development, reproduction and streaming gives
Epidemic inside and outside in House, one turn what at areas with IDHM high present reduction gives vegetation native, increase gives density populational and, per The end, increase of use and the waste of drinking water and rain, contributing to the multiplication of outbreaks. Therefore, cities with IDHM high, in some cases, they can increase The rate in notification From cases The proportion what create conditions favorable for multiplication of them.

Temperature is one of the climatic variables investigated when studying the incidence of arboviruses (Massad et al. al., 2011; Mutheneni et al. 2017; Vezzani, Velásquez & Schweigmann, 2004), because as the temperature increases, the mosquito Aedes aegypti and O virus present periods most short in development (Tseng et The., 2016; nakhapakorn et al., 2005; ha et al., 2011; tong et al., 2016; Choi et al., 2016; hi et al., 2012; Bhatt et al., 2013; Teurlai et al., 2015). In addition from that, temperature increase of approximately 3°C, higher temperatures (28°C and 32°C) and small daily fluctuations in temperature also they can increase The reproduction of mosquito and The replication of virus and per therefore increase at fees in streaming of arboviruses (Teurlai et al., 2015; Araujo et al. al., 2015; tong et al., 2016).

The climate of Ceará is tropical hot semi-arid with average temperatures varying according to each region of the state, being what at the Coast, The average It is in 27°C; in the saws The average It is in 22°C; at the Sertão The average It is in 29°C, or be, O state it presents temperature heterogeneity. According to Honório et al. (2009), the average monthly temperature above 22-24°C is related to the abundance of Ae. aegypti and consequently a higher risk of disease transmission. Corroborating with the Dice previously presented per honorary et al. (2009), at City of River in January, in between 1986 The 2003, he was observed what one of the risk factors associated with dengue epidemics was the average minimum temperature above 22°C (Câmara et al., 2009). Also in wake up with Favier et al. (2006), in a study accomplished at the District Federal, the number medium in pupae per container increased in proportion as the average temperature increased above 22°C. Therefore, the temperature regions equal to or below 22°C would not favor the development of the mosquito or the virus, which would reduce the streaming of arboviruses. Against from that, we suppose what The temperature minimum in 20ºC, so as The temperature average Yearly smaller found us counties ceará with smaller incidence in arboviruses be factors responsible for the decrease of number in cases in these cities, for how much no there was difference in between at temperatures maxims.

Results similar about The larger incidence in arboviruses in regions in temperature most high were reported in a study that investigated the relationship between climatic variables and the incidence of dengue in Brazil, for the years 2008 to 2011 in all Brazilian municipalities that had at least one case of dengue (Monteiro et al. 2020). According In this study, the higher temperature had a positive influence on dengue cases, that is, the hotter the more cases of dengue. dengue. On the other hand, the minimum temperature variable has a negative, albeit weak, effect on the number of cases of dengue. Also Monteiro et al. 2009, to analyze you cases gives dengue at City in Teresina, capital of Piauí, in between you years old from 2002 to 2006, observed that the incidence of dengue was higher in periods with higher temperatures. Nonetheless,
It is worth mentioning that it is not always possible to demonstrate this link between high temperatures and an increase in the incidence of cases of arboviruses at region North East. Per example, in cities gives Paraíba, also located at region North East of Brazil, The analysis of dengue cases in three cities revealed that the temperature, regardless of average, maximum or minimum, does not present association with dengue cases. The authors suggested that one of the possible factors for the absence of a relationship between the variables was the low thermal amplitude found throughout the state, in this way, the mosquito and the virus find temperatures most uniforms for you their developments to far away of year independent gives region (Almeida & Silva, 2017), Likewise, in the study by Morais & Farias, 2021, carried out with 184 cities in Ceará, it was also not possible to to demonstrate relationship in between The incidence in dengue and The rain in between you years old in 2013 and 2018.

As this limitation is known when using the 184 cities, two mathematical tricks were made here in this study, first the analysis using only the twenty cities with the highest and lowest incidence of arbovirus cases, as well as the temperature was divided into maximum, average and minimum, so it is possible that these devices have facilitated the study of variables and The demonstration of difference in between they.

THE unavailability in access The Water treated and piped It is a factor that increases The incidence in arboviruses, one turn that its accumulation in containers, such as buckets, pots, basins and water tanks, without proper care, favors reproduction, mosquito development and disease transmission. Thus, it was possible that cities with a high incidence of arboviruses presented low average per capita water consumption and percentage of total water service when compared with cities with a lower incidence of arboviruses. However, it was not possible to observe a statistically significant difference between the groups in relation to these two variables: average per capita water consumption and percentage of attendance total in Water.

Similar to treated and piped water, rainwater is also a risk factor for arboviruses, however, it is not the lack of access to rainwater, but rather its storage in tires, pots, bottles, scraps, abandoned swimming pools, construction debris and garbage during the rainy season. Therefore, cities with high annual rainfall present bigger scratches in incidence in arboviruses as it was demonstrated in studies performed in counties and States.

Northeast and North regions, which pointed to a relationship between the intensity of rainy conditions and the incidence of arboviruses (in Castro et al., 2018; saints et al., 2019; Silva et al., 2016; of Birth et al., 2020). Nonetheless, The resemblance of the average per capita water consumption and the percentage of total water service, it was not possible to observe a difference statistically significant in between you groups with relation to precipitation average Yearly.

Particularly, it can be assumed that the similarity between the values referring to precipitation between the municipalities of larger and smaller incidence he can be related to fact in what, although you counties ceará possess one block rainy most intense us months in February, March, April and May, at information here collected involved all you months of year, or be, you results obtained express average
Yearly. In addition from that, O volume in observed rains at the Ceará in 2021 he was reduced up until us months in larger intensity. AND per last, you counties ceará in 2021 no presented one homogeneity in rainfall data, which may have interfered by increasing the standard deviation and reducing the difference between the means. Per On the other hand, according to Morais & Farias (2021), the demonstration of this relationship between the incidence of dengue and rainfall in Ceará was possible due to the fact that the study was carried out between 2013 and 2018, that is, portraying a longer period of time, in addition of what in that period at rains were in some years old most intense of what in 2021, intensifying at differences in between at averages in precipitation. Also Valley point out what at the study in morals & Farias, 2021 only were evaluated you cases in dengue. On the other hand, our study addressed the incidence of arboviruses in general as well as individual, including dengue, zika and Chikungunya.

As It is known, O trash generated inside From households, so as that one produced per City, When no collected and properly disposed of within a solid waste management plan, they can become positive deposits for Aedes. According to Rodrigues (2020), Ceará is the northeastern state with the highest per capita production of solid waste per day - 1.06 kg. In addition, of the 2.4 million tons of garbage produced in the year, about 1.3 million (55.2%) is irregularly discarded. This means that, although the ten cities with a high incidence of arboviruses have a high coverage rate of household waste, reaching an average of 84.33%, well above the average of 58.30% presented by the other ten cities, they are far from reaching the ideal collection, which would be 1.06 kg per day, while, they have only 0.82 kg per day. On the other hand, the ten cities with the lowest incidence of arboviruses, even with low coverage rate, they still have an average per capita collection of 1.3 kg, well above 1.06 kg per day produced in average by the Ceará.

5 CONSIDERATIONS FINALS

You results revealed as at arboviruses they are widespread in the cities Ceará, visa what From 184 counties only 7 had no cases of the epidemic. In addition, they showed that cities with the highest incidence of arboviruses are those with better socioeconomic and health indicators, as well as average and minimum temperatures most high, at the however, with relationship to the indicators in education, so as temperature maximum, no were found differences between groups. Therefore, we suggest that national, state and municipal public policies, as well as the agencies and departments linked to dengue control intensify their actions not only during the rainy season in Ceará, but act also during all O year, visa what others factors as IDHM, density demographic, income, infant mortality, number of health facilities, number of doctors, sanitation and waste collection rate solids may be linked to the increase in arbovirus cases in Ceará's cities. In addition, new studies are necessary in order to identify the strengths and weaknesses of each region, as well as contribute to the forecast of endemic diseases, since even with an increase in reported cases and a reduction in the number of positive locations for the Epidemic, some evidence still point for a potential epidemic growing of arboviruses in regions tropical, influenced in Good part by conditions weather, demographics and socioeconomic favorable found at region North East.

CHAPTER 119

The landscape archaeology as an environmental project instrument

Saide Kahtouni
Urban Architect by FAUUSP (1986), Master (1993) and PhD (2003) from the University of São Paulo, with the thesis entitled "City of Waters", which dealt with the structuring of the city of São Paulo in its relations with the waters, under the guidance of Professor Dr. Murillo Marx, now deceased, and former director of the Institute of Archeology at USP. This thesis generated his book "City of Waters", published by Rima in 2004 and the book São Paulo; City of Waters, in press by British publishers. His master's thesis was developed in the Landscape and Environment Research Group and was entitled: Engineering systems as factors of environmental and landscape mutation in the Tietê valley, working on the entire extension of the Tietê waterway in the state of São Paulo. Specialized in 1998 in Environmental Management and Technologies at Escola Politécnica da USP. Member of the Brazilian Writer's Union since 1985 and of the Brazilian Landscape Architects Association - ABAP since 1997, she was National President of this entity, between 2009-2011, working for LALI - Latin American Landscape Initiative, and, as a landscape architect, since the 80's, developed several landscape projects for public spaces in the city of São Paulo, uniting art and urban landscape. She has several articles and books published.

ABSTRACT
This article is about the landscape comprehension using concepts as a technic-scientific period and the informational media and the interfaces between technology and the infrastructures, becoming necessary the review the recent accumulated layers on the landscape. The cultural landscape transforming, the urban landscape layers, processed at the time. This new methodology has an important role for the urban projects future applications.

1 INTRODUCTION

I will begin with a kind of survey of some ideas that were engendered from the scientific thought of the eighteenth century to seek understanding of how the various parts of this thought, arranged in areas of knowledge, culminating in their reunion, when dealing with such a multidisciplinary object as landscape, in a kind of archeology1, both of thoughts and of its understanding. This archeological principle, over time, as well as the idea of landscape, was transformed, encountering the modernity of the 20th century and the sudden change of paradigms.

From recent scientific thinking, based on the relativity of knowledge and systemic visions, the principles of historical understanding have turned more and more to explaining the present and the conditions of the common man rather than to social monuments. So stated Foucault in his epistemological work of the 20th century:

(...) If one wants to undertake an archeological analysis of knowledge itself, then it is not these celebrated debates that must serve as the thread and articulate the purpose. It is necessary to reconstitute the general system of thought, whose network, in its positivity, makes possible a play of simultaneous and apparently contradictory opinions. And this network which defines the conditions of possibility of a debate or of a problem, is the bearer of the historicity of knowledge...

(FOUCAULT, 1990: 107)

1 An archeology (from Greek archei - ancient, plus logia - discourse, ordering)
In the late eighteenth century, from the pioneering excavations of Pompeii and Herculaneum, Europe plunged into a fever of archaeological discoveries, motivated by the birth of modern scientific procedures and the richness of the legacy of the peninsula civilizations, the Greeks and Romans. Archeology, which according to PERINETTI:1975:13, was called by Plato "the history of the ancient heroes and races and of the origins of the city", was linked from then on to the monuments and artifacts of the ancient civilizations, whose search began to touch the Mediterranean, then Africa and later the Americas.

As research progressed, deeper into remote time was entered and scientific possibilities allowed for more and more distant times to be specified. Overlapping archaeological layers began to be identified more precisely, and the idea of civilizational overlaps was finally proven in the 20th century. (TRIGGER:2004)

Wars, forced domination of one city over another, trading interests and architectural typologies were revealed in successive layers, demonstrating the processes of reuse and subjugation of the weaker cultures, of the vanquished. Regionalisms started to be identified in time and Geography, discussed philosophically since ancient times, by the Greeks (MORAES: 2005: 49-58). It was now necessary to explain more concretely the spatialization of the finds.

First, a physical geography, of a deterministic nature, and then, in the reading of the landscape, the discovery of the evolution of the view of nature, fruit of the discussion of the relations between society and its environment, bringing new parameters for the establishment of the so-called Human Geography, today an important basis in the discussions about Landscape.

However, another phenomenon occurred, almost concomitantly: industrial civilization rushed to profoundly alter the geographical environments of its existence, causing urban agglomerations never before seen in the history of settlements. Cities, social artifacts, thus became an inexhaustible source of daily transformations of a landscape that starts to suffer overlaps of layers that are increasingly rapidly configured. Then the recognition of new forms of urbanization, through the implantation of large man-made geographical objects.

It is unquestionable, then, the need for a new archeology of the landscape, based on the visible present, that finds the closest testimonies of the transformations and processes materialized and superimposed in a society of velocities. This is an industrial archeology of the landscape in the cities and urban extensions.

2 THE LANDSCAPE AND LANDSCAPE ARCHITECTURE

"Civilizations rest on the earth"
Fernand Braudel, 1959
In 1993, in the development of discussions registered in my master's thesis, when I set out to conduct a reading of the landscape potentials along the giant Tietê waterway, I discovered in the Aurélio dictionary that the word landscape takes us back to the Latin origins of the word "paysage" from the French, whose root (pays) means "country". (KAHTOUNI PROOST DE SOUZA:1993:11). This proximity between PAISAGEM and COUNTRY, the latter word, the one we use as a designation of a territory of linguistic, ethnic and cultural identifications of a people, makes one notice the interesting fact that, in the search for the so-called "landscape units", territories of homogeneities and geographic identities are also configured and can be delimited.2

These delimitations are, in turn, very close to the empirical discussions that were contemporary to the European territorial reformulation of the nineteenth century, during the unifications, especially of Germany, experienced by the pioneering geography of Ritter, in the search and definition of places and that accompanied the German territorial unification ideal. His work was later expanded by the works of Ratzel, another German, who, in the last quarter of the 19th century, clearly represented in his formulations the state ideal of unification and constitution of the German state around the kingdom of Prussia. Ratzel defined the geographic object as the study of the influence that natural conditions exert on mankind. For him, according to MORAIS:

" territory represents the conditions of work and existence of a society...

Elaborating the concept of vital space3 in this context, Ratzel ended up generating a geographical theory that legitimized Bismarckian imperialism at that time (MORAES:2005:70). As a positive aspect, this theory privileged the human element, approaching historical analysis when dealing with the formation of territories, but even so it still considered man in a similar way to an animal, in search of its territories and vital spaces, in a very naturalistic view.

In 1870, due to the Franco-Prussian war, France lost the territories of Alsace-Lorraine to the Kingdom of Prussia. These were important coal-producing regions, fundamental to the industrialization process in continental Europe. The German unification process and subsequent German imperialism had found in France a rival nation, already defined and delimited by its previous unification, which had occurred through its absolutist monarchy. The war would only materialize the territorial aspirations of each of the nations involved. In this time and context Ratzel's geography would face the displacement of geographic discussions to France by the hands of Vidal de la Blache, who "defined the object of Geography as the man-nature relation, in the perspective of landscape", locking with Ratzel's determinist and geopolitical theory

---

2 About the etymological meaning of the word LANDSCAPE and its unfoldings, which I will not go into here, informing only that there are other discussions, perhaps more in-depth, recorded, by other authors and researchers, in the Bibliography.

3 It would represent a balance ratio between the population of a given society and the resources available to meet its needs, linking to this its possibilities to progress and its needs for territorial expansion.
a rich dialogue of oppositions, which was based on the discourse of geography as an objective science (MORAES:2005: 81).

The geography of Vidal de La Blache emphasized the study of landscape as a methodological principle, focusing on human-nature relations rather than on social relations. Founder of the possibilist doctrine, Vidal de La Blache challenged the determinist ideas of the Germans and created a plethora of followers, which lasted until the mid-twentieth century. However, the discussion about landscape, present since the first discussions of geography, has also undergone changes over time. Today it would be impossible to discuss landscape without society and its issues, associating it with the concept of Environment⁴.

In the past, it is well known that the ancient Latins called "pagense" the land delimited for the practice of agriculture and resulting from the human action of the reticulated division of centuries, the "centuriatio" (BENEVOLO, 1983) in the advance of the vast Roman Empire across Europe. There is also no doubt that from the beginning, the word landscape and its roots are associated with the idea of field, of rural territory, of this "pagan" where crops, plantations and cities were established. The cities are, in turn, in the beginning, the cell of the productive command linked to an extensive agricultural area, through which canals were extended, and then bridges and roads. A first idea of humanized landscape is born there, still linked to the countryside and the establishment of human cultures, because the conformation of the landscape by the people, since the first cities and plantations left their mark in an extensive territory, fruit of the western expansion of the Roman Empire that dominated the late antiquity.

This process, emphasized by European historiography, developed from the archeological discoveries of the 18th century, later led Geography to abandon the first deterministic ideas of its founders and to think about human action over the planet and its morphologies, mainly from the 20th century on. This also gave rise to the first idea of culture, which, also having its etymological roots in rural work, deepens in the 19th century its broader definition as a human manifestation, which could even distance itself from the idea of "civilization" cultivated throughout the 18th century. The culture that, according to Terry Eagleton, also starts from the relations between man and nature, between subject and object,

"means a double refusal: of organic determinism on the one hand, and of the autonomy of the spirit on the other. It is a rejection of both naturalism and idealism..." (EAGLETON: 2005,14)

In fact, the most remote origins of this trajectory of the discussion of man in relation to the objects of nature, may be in the first philosophical reflections developed by the ancients, ideas about which I will not go deeper here, as they would be worth a specific article, which I do not venture to write.

⁴ I develop this parallel between the concepts of Landscape and Environment a little further in the article entitled "Conceptual Bases for Research on Urban Infrastructure and Environmental and Landscape Quality", published in the Revista da Pós-graduação FAUUSP in June 2006, where I resume concepts initiated during the elaboration of my Master's thesis, in the 80's and 90's.
Starting, then, from a more recent and fundamental moment for the domains of the so-called modern science, the 18th century, it is noted that the English term for landscape, the word "landscape", was already present in the English Landscape Tradition Movement, in those works of the so-called "landscape painters" in England, representing especially at that time the escape from the bucolic, the search for scenes far from the city in intense transformation, and that also reminds us of the idea of "piece of land".

Realizing that nature provided in itself an indisputable aesthetic pleasure, they created an almost "naturata" way of making new gardens, less humanized. The observation of the cycles of nature itself and of autochthonous formations gained strength in this new English school. Its developments will be briefly outlined here, based on the viewpoints of some well-known landscape architects, as representatives of the landscape thought engendered in the industrial era, now on the new continents. Artists and technicians, contemporary to the Industrial Revolution made explicit their concerns with these issues of the historical materiality of human action on nature and of human action on nature itself, contributing so that, later, many of the so-called landscape architects in the following centuries, went from gardening, from the construction of the beautiful "lost garden", to the environmental project.

The development of this new vision for a "New World", improved in the 19th and 20th centuries, and which surpassed the search for the "lost paradise" expressed in Renaissance and Baroque gardens in Europe, contributed to the establishment of new concepts and practices, especially in the American continent, in the United States. The grandiosity of a new and virgin territory, marked by the path of the pioneers, which culminated in a true ethnic destruction of the Native Americans during the 19th century, generated in a privileged portion of the population the desire for conservation and respect for at least the monuments built by nature, many of them still associated with mythical issues of the people of the land, such as the well-known Yosemite Valley, transformed into a National Park in 1872.

The American movement for National Parks, large territorial portions demarcated for preservation, gained worldwide notoriety. It was in this country that, in 1858, Frederick Law Olmsted, a sanitarian, created the term "landscape architect". At that time, Olmsted stands out for numerous urbanistic projects, including New York's Central Park, having participated in 1865 in the campaign for the preservation of Yosemite Valley, in California, and its transformation into a national park inaugurated in 1872 (JELLICOE:1995), laying the foundations for the foundation, in 1905, of the U.S. Forest Service and the creation, in 1916, of the National Park Service (LAURIE:1983:88). These projects crowned the empirical learning of American landscape architects in working with the landscape.

Olmsted also stood out for pioneering works on the urban landscape, linked to issues of sanitary engineering and urban planning practice, and which are still to be recognized as a strand in the history of the practice not only of landscape architecture, but of urban planning. Two of his disciples, Horace Clevelan and Charles Eliot, created in 1901, at Harvard University, the first complete program of landscape architecture. In 1907, the profession of urban planner emerged as a discipline derived from this course. It is worth consulting American authors such as LAURIE:1983, HAMMACK:1988, and SPIRN:1995, who,
in a certain way, introduce the new urbanistic vision that the exercise of landscape design brought and its serious implications on the discussion of American city planning, up to the present day.

The North-American contribution, from the 19th century on, to landscape issues is also emphasized by Prof. Catharina LIMA in her beautiful and instigating article entitled: *Nature and Culture, Gilgamesh's conflict* (LIMA: 2004), which concludes with the following assertions:

"In time, North American landscaping bequeathed to history these important contributions, through names like Olmsted, Church, and Eckbo, whose sensibility in the appropriation of natural processes (whether on the scale of garden or city) did not mean a denial of the aesthetic possibilities of the project and vice versa. However, in the second half of the 20th century, more precisely at the end of the 1960s, the vision of synthesis between natural and human processes, science and art was lost, with the consolidation of design lines that positioned themselves as distinct - the environmentalist orientation (advocated by Ian Mc Harg, John Lyle, Robert Thayer, Ann Spirn and Michael Hough, among others) and the view of landscape as art (advocated by landscape designers such as Peter Walker, Martha Schwartz, Georges Hargreaves, and Michael Van Valkenburgh). In the midst of this controversy, landscape designers such as Laurence Halprin advocate the compatibilization of these orientations, emphasizing issues related to the perception of the people who will enjoy the built environment. An analytical investigation is necessary at this moment, in order to better understand the universe of these conceptions, which often present themselves as divergent, precisely at a moment in history when the consequences of a fragmented and excluding perception are questioned, and the consequences of the rupture between nature and culture are evaluated. (LIMA: 2004:55)

Let's look in a more chronological and very simplified way at part of what happened in the 20th century ideology. After the great American preservationist movements of the 19th century and the ideal foundations of American urban planning, it was only in the following century, in the 1930s, during the so-called "Depression", that landscape architects resumed major works in America, where large public programs linked to landscape planning were formulated. The works linked to the U.S. National Parks Service stood out. The experience in the project implemented by the Tennessee Valley Authority in the Tennessee River valley is a remarkable example of the scale of work achieved by landscape designers, involving the implications of ecological links and hydrological cycles - floods and ebb tides - in planning and land use (KAHTOUNI:1995). The American agency, now called The Tenesse Valley Water Shed continues to exist and plan, in an integrated manner, for navigation, power generation, recreation, agriculture and sanitation uses, regardless of which governments are elected. It covers the state of Tennessee and five other neighboring states, and has been the pioneering experiment in continued territorial management by watershed, still a worldwide example today.

This pioneering experience, through the management of water resources for power generation and multiple uses inspired here in Brazil the creation of large national state companies, from the 1950s, many of them now almost extinct and privatized, such as CESP and others, which followed in their deployments and construction programs the geopolitical ideals of development of the national territorial occupation of the time, marked by the leaps of our industrialization and the logic of territorial organization of our power generation ventures (KAHTOUNI:2005). Within this, there was the long process of implementation of the Tietê waterway, in the state of São Paulo, which is now in operation, where in a certain way some landscape...
issues were introduced, either linked to leisure uses or to the ideal of recomposition of the immediate surroundings of the reservoirs (KAHTOUNI:1993). The planning of the wider territory, the broader vision of landscape planning, in turn, were not applied in Brazil in this period of our implementation, limiting the landscape practice to treatments of the surroundings of reservoirs, also carried out with many difficulties.

Perhaps in this fact is already apparent the conflict between the various visions of parts of society in the world and in a country, with regard to landscape, nature and the environment. The environmentalist ideology was born from movements for the preservation of the landscape, seen first in a philosophical and contemplative way and then, with the development of ecological sciences, in a more scientific and comprehensive way. Even today, the maintenance of the Everglades aquatic reserve, created in 1935 in Florida, is of fundamental importance in the process of replenishing the aquifers of the southern United States. Environmental issues were already being raised there, in an essentially practical way, in these larger-scale works carried out by the Americans.

In Brazil, some concerns formulated since imperial times are revealed with more force in the reorganization after the new Constitution of 1934, in the Republic of Getúlio Vargas. Our Water Code in 1934, our first Forest Code in 1934, and the foundations of large National Parks and of SPHAN- Serviço de Patrimônio Histórico e Artístico Nacional in 1937, later designated IPHAN.

Over time, especially since the 20th century, the visions of landscape and also of environment have changed worldwide, expanding and recycling themselves according to the development of the understanding of the processes that form and consolidate the construction of territories and landscapes, natural or artificial. Ecological processes (objects of biology and ecology) and anthropic processes (objects of anthropology and the so-called applied social sciences) are progressively unraveled over time and thus increasingly understood by landscape and environment scholars. Thus, a desirable approximation between objects and subjects (KAHTOUNI,1989:57) would be progressively made, moving towards an environmental view of landscape.

Still in the field of geography, Max Sorre’s theoretical contribution focuses on the landscape, which is discussed from the concept of "habitat", bringing in the core of this discussion the idea of transformation and dynamics of the interactions between man and his environment. The idea of a geographic space of interrelations, of the overlaps between cultural actions and ancient nature emerges. It is the foundation of a new human geography, arising from the recycling of La Blache's ideology, specifically focused on the products of human action and not on social processes, object of sociology.

Looking again at the comments of LIMA:2004, who discusses the possibility and the need for further research on the real contradictions between the two orientations of working with landscape, one focused on the environment and the other on art, I think that the great link between apparently contradictory currents in working with landscape is the creative will. The creative gesture, which recovers and sows a new landscape, in a certain way rescues the pre-existing situation. Even if it destroys and destructs it, this gesture, when human, embeds in itself its reading and positioning.
These positions, then, would be pioneered by those who had in the work of landscape design and intervention their great channel of contact with the objects of the conceptualizations historically worked by geography. Therefore, the Americans... since the 19th century, by the possibilities of a territory to be urbanized and by the challenges imposed by the projectual practice on a new landscape.

In the 1950s, Garret Eckbo, the great California landscape architect of the 20th century, defined landscape architecture as

"[...] that part of the landscape that man develops and shapes, beyond buildings, roads and services and even wilderness, which in the first term is designed as a space for man to live in (excluding agricultural and forestry performances). It is, then, the establishment of relationships between building, cladding and other outdoor structures, land, rock formations, bodies of water, plants and open air, and the forms and features, representative of the landscape itself; but with a primary focus on human content, on the relationship between people and landscape, between humans and an outdoor space that is quantitatively and qualitatively three-dimensional.' The field of work and performance of the so-called "landscape design" is widened again. (ECKBO,1950:5)

It is interesting how this specific formulation clearly evolved from the ideals of William Morris when he defined Architecture in the 19th century, as "the set of modifications and alterations operated, due to human needs, on the earth's surface, which outside of this is pure desert". (BENEVOLO,1983:87)

In his first text, Eckbo, from 1950, includes a quote from geographer Carl Sauer, in which the idea of natural and cultural landscape is thus expounded:

... "Geography is based on the reality of the union between the cultural and physical elements of the landscape." (ECKBO: 1950:31).

According to Milton Santos (SANTOS:1986:16-26) Carl Sauer, "the great American geographer" would also represent an offshoot of Vidal de La Blache's ideas, constituting a branch on the other side of the Atlantic, concerned with the interrelations between human actions and nature, despite the terminology of the time treating these two geographies as two branches: human geography and cultural geography. Sorre states, also in the 1950s, that American sociologists, through urban studies, mainly the Chicago group, led by Burgess, had also found Geography (SORRE,1957:152,153) for the elaboration of their models to explain the city.

The consideration of human action as a primeval, creative act was further relativized by Eckbo, but the stance of Mc Harg, a Scotsman living in the USA, is revealed in the following sentence:

"Perhaps the most important conceptual contribution of the ecological stance is the perception of the world and of evolution as a creative process. This is easily demonstrated if we examine the difference between the Earth in its primitive times and the planet we know today." (McHARG:2005:52)

5 Miranda Martinelli Magnoli in her 1987 memoir (MAGNOLI:1987) takes this fundamental discourse of Morris as the great motto of her work as a professor at FAUUSP since the 1970s, considering the work with landscape as an attribute of Architecture.

6 This American geographer and others, such as Max Sorre, are extensively discussed in Milton Santos' For a New Geography, especially in its first part.
In the 1960s, when this author wrote the important work "Design with Nature", the process of economic growth in the United States and Europe exploded in the metropolization of cities, especially American ones. The growth in consumption led to imbalances due to technological development, the increase in population densities, the expansion of the scale of environmental impacts, the expansion of the use of agrochemicals, a situation that spread to developed and developing countries. Thus, in various parts of the world the first appeals of the post-industrial society appeared, questioning the purely developmentalist values of Western civilization - that is, the first ecological movements. The fact is that the chart overlay method advocated by Mc Harg and the recurrence to human history and its transformations on the environment guided the work of landscape architects in the following decades.

At that time, for the first time, the perverse effects of pollution were felt on a global scale, affecting cities, fields, and water resources. The extent and intensity of the impacts of the new technologies implemented by man grew, causing real ecological disasters in a short period of time. Everything made it possible for conservative, preservationist voices, many of them extremely romantic in nature, to rise up against the so-called "modernity". The "ecopolitics" arose. And a great conflict arose: the questioning of real development and about growth and its implications. From then on, modernity began to have an ambiguous meaning.

In 1972 the Club of Rome report was consolidated, demystifying the pure economic growth, so exalted "in the golden years" (HOBSBAWN:1997:257). That same year the Stockholm Conference was held, when, for the first time, the possibility of sustainable development was raised, still in a subtle way. It is in this period that the first forms of environmental assessment of enterprises are established in the USA and Canada, with the creation of bodies that control environmental impacts. In 1969, in the United States, the National Environmental Policy Act (Nepa) implemented the Environmental Impact Study system for enterprises, which became effective in 1970. According to Tommasi (1994), Germany adopted the Environmental Impact Study system in 1971, Canada in 1973, France and Ireland in 1976, and Holland in 1981, the same year as Brazil. In the mid-1980s, several peripheral nations adopted legislation for the environmental control of projects, requiring the prior preparation of environmental impact studies for the licensing of projects.

Just before the meeting in Stockholm, in 1970, Vilanova Artigas, newly arrived from a UNESCO meeting, the Meeting of Experts on the Teaching of Architecture, held in Zurich, Switzerland said in his speech at the IAB:

"... Now, if man wants to launch himself toward the Cosmos, he will have to abandon the Earth because he has destroyed it entirely. This is the problem that presents itself to us in today's world: to make nature or to exploit it, and to make a properly human nature. And how to create a properly human nature? One that has such characteristics that man can harmonize with it, and not be the predatory element that he has been until today, due to the circumstances of his intentions to modify it?

From the notion of project as design, the architect, from his performance in industrial design, through visual programming and as a constructor of the landscape, will have a greater responsibility. It is necessary, then, to form, from the schools, a new kind of man, the new architect,
And from there he goes on to advocate the multiple possibilities for action and social insertion of the professional architect in a society that increasingly demands interdisciplinarity. This path, especially designed for the Architecture courses at FAUUSP, and discussed throughout Brazil, would not privilege only Art, Science, Urbanism or History, but searched for a full environmental comprehension research, in its geographic, historical and social interfaces, opening the possibilities for the equating of the exercise of landscape architecture, in the search for a greater social insertion, as previously recommended by master Artigas. The methodological orientation of Marxist origin, searching for the understanding of processes and not only of forms, as advocated by the old Morris, remained there vigorously, even in the midst of difficult moments of our political history, of which many of our professors at the University of São Paulo were part.

These changes in planning directions are clear since the 1960s, when McHarg writes about big cities, about the conurbations that are taking place between different cities, and about nature in metropolises. He advocates working methods based on the reading and consideration of natural processes to indicate the potential uses of certain areas, suitable for urbanization, preservation, industrialization, agricultural, recreational and other uses. The author detects the various types of landscape conformation, interrelating the natural processes of the supports to the potential uses of each of them, within a territory cut according to morphological and ecological criteria, making intensive use of geographical and ecological instruments. In one of the chapters of his work Design with Nature, recently translated into Spanish (Mc HARG:2005), he contrasts primitive visions of the natural environment with the history of gardens, to talk about the human values involved in the recreation of a new nature, domesticated and symbolic.

As a teacher, Mc Harg declared that every year he was faced with a ceaseless struggle to break the anthropocentrism present in the minds of his young students, eager to project. The author glimpsed two polarized points of view in the way of understanding the man-nature relationship: the first, anthropocentric man, unaware of his origins and trajectories, destructive wherever he goes. The second, not so sure of his knowledge, reserving to himself the right to justify the human presence, a species differentiated by the gift of conscience. The latter would bring with it respect, born of understanding, seeking, then, its creative role. (Mc HARG:2005:46)

In the same period, Garret Eckbo wrote his fourth book on landscape design (ECKBO:1969), addressing the need to return to Eastern concepts of integration between human beings and nature. Also criticizing Western society for its "technocratic anthropocentrism," the author points out that the field of landscape design encompasses architecture, nature, history, and society, each of which must be understood in its differentiated role, integrated and balanced. Eckbo defines architecture within the landscape field as the primitive expression of creativity and control of nature as by man; he defines nature as the important
world of forces and processes with which we live and work; history as the result of social processes, and landscape as a portrait of the history of human culture and society, and that society is reflected in the landscape. According to him, "anthropic is the expression of social forces in the natural world. And for this reason all activities connected with the construction of spaces, facilities, infrastructures can be considered participants and conformers of the landscape.

In the mid 70’s, Michael Laurie, in his retrospective work about the methods of working with landscape, demonstrates the clear influence received from these masters (LAURIE:1983). The analytical working method, based on the interpretation of several factors separately in its graphic representation, isolated letters to be superimposed, predominates, in the incessant search for a projectual synthesis that integrates processes and products. In a single literary work, the author gathers theoretical subsidies and practical examples for the performance of the landscape designer. Laurie identifies three scales of work: that of planning and evaluating the landscape, that of planning a given site, and that of detailed landscape design, through the selection of components, materials, and plants and their combination, to give solutions to concrete and clearly defined problems.

In the 1980s, the Californian professor John Tillmann Lyle delved into the methodological issues of landscape design. His ecological vision is so broadened that it is no longer enough to recognize the processes of nature and integrate them into the implementation of uses and design, it is necessary to create and recreate processes from the readings made. Design is no longer something so subjective; it is the fruit of an analytical method that suggests very clear objectives to be achieved, becoming the means rather than the end. The incorporation, in the new projects, of the fourth dimension of the landscape (time) and the ecological instruments start to aid the domain of the processes and dynamics of the work object.

The project/impacts interrelation is definitely placed as the dynamic of creation in environmental design, as it provides the traditional project with new objects. On the other hand, in the geographical thought developed from the 1980s on, urbanization is no longer the focal point of the analyses of several landscape theorists, as already placed.

Also in the 80’s, in the geography classes of the Brazilian professor Milton Santos, in which Miranda Martinelli’s students were compulsorily enrolled, important ideas of this process were taken up again. The author developed the concept of a new period of space-time in human history called "technical-scientific environment”, defined as "the historical moment in which the construction of space will take place with a content of science and technique." (SANTOS:1986, SANTOS:2002:120) and in another text (SANTOS:1994) the author discusses more specifically the idea of landscape from the concept of cultural geographical objects. The dimension of perception is already incorporated into geographic knowledge.

3 GEOGRAPHY IN POST-MODERNITY AND THE NEW CHALLENGES OF HERITAGE

Also in the 1980s, in the geography classes of Brazilian professor Milton Santos, in which Miranda Martinelli’s students were systematically enrolled, important ideas about this process were taken up again.
The author developed the concept of a new period of space-time in human history, designated as technical-scientific period and defined by him as "the historical moment in which the construction of space will take place with a scientific and technical content" (SANTOS, 1986). In other texts (SANTOS, 1994, 2002), the author discusses more specifically the idea of landscape from the concept of geographic and cultural objects. The dimension of perception was already incorporated into geographic knowledge and the meaning of landscape was under discussion.

"Perception is always a selective process of apprehension. If reality is only one, each person sees it differently; thus, man's view of material things is always deformed. Our task is to go beyond the landscape as an aspect, to reach its meaning. Perception is not yet knowledge, which depends on interpretation and this will be more valid the more we limit the risk of taking as true what is only appearance". (SANTOS: 1994:62)

Precisely after the 1980s, when urban growth was not so explosive in the more developed countries and the anthropization phenomena were already occurring through complex systems for the establishment of infrastructure, communication networks, and intensely mechanized agricultural uses, the territory is seen as a "set of possibilities," not necessarily restricted to the urban network and its interconnections. Rural space then takes on a different role. It is no longer the empty space threatened by urban or industrial growth, devastators of ecological processes in balance. It is also a set of artificialized spaces, in which support processing is intense.

The traditional view of geography meets and assumes, from then on, the new theoretical contributions, such as that of Milton Santos, who brings "within the critical geographic thought the dialectic between unity and diversity. He also brings the conception of science as a moment of praxis" (MORAES: 2005:130) and this stimulates reflection on the present. From conscious reflection on the present, transforming action unfolds. The ideals of a modernity focused on the integral project developed from the 1930s on, find then, in this more recent moment from the 1980s on, marked by the contradictions of the modern world project, only partially concluded, its conceptual contribution based on a critical reflection that involves social issues in the discussion of landscape and its mutations.

Thus, I could risk thinking that, in the face of all this, in the 20th century, marked by the two world wars, fruit of the mass destruction of several nations and by the need for the reconstruction of torn countries and cultures, first of all history sought geography through the great writings of BRAUDEL⁷, and later, in a moment of expansion of ideas around the world, marked by post-modernity, Brazilian geography sought to understand the cultural context in the texts of Milton Santos. Our geography also sought history. And our new Architecture needed to recover these two disciplines. In Eagleton's words

---

⁷ I discovered Fernand Braudel in an informal conversation with Murillo Marx. From something so beautiful that he told about him my curiosity grew and from then on I began to try to understand more and more his importance as a historian. From his first writings about the Mediterranean generated in a prison, as the professor had told me, I understood by reading the text that there was registered the latent memory of the landscape, the geography alive by the facts of the past, in a Europe that was burning and agonizing in war.
From understanding this conflict that multiplies into conflicts between past and future, ideals and materialisms, globalisms and local traditions, comes the idea that it is necessary to anticipate choices and selections of what should remain or what would be important in a given cultural context. And who would make them within a design?

The landscape, as a cultural product has come to be endowed with values and social judgments in its time. The materiality is registered in the interactions between "ecofacts and artifacts" (MENESES, MIMEO, 1975?), products of nature and society. The ecofacts, remnants of the simply natural transformations, increasingly rare, and the artifacts, increasingly aggravated and modifying the landscape. From the junction of the two, my speculation of a new category for the reading of the landscape becomes necessary: the eco-artifacts.

We then realize that the pre-existing structures and forms of the landscape present a set of potentialities to be pointed out according to the understanding of which landscape and environmental values should remain or be further developed. This is where the discussion about Heritage and its presence in the landscape also takes place, whether cultural or natural, because all of nature has already become part of the humanized and recognized territory.

For example, in 1985, the Serra do Mar, near São Paulo, was declared a National Heritage Site by CONDEPHAT - Conselho do Desenvolvimento do Patrimônio Histórico e Artístico do Estado de São Paulo. The geographer Aziz Ab'Saber, who had as one of his assistants the architect and professor Murillo Marx, was working in the organization.

Flávio Motta wrote with optimism at that time:

"...and the current situation allows for greater intimacy with an art and a science that are ever closer, thanks to the emancipation of the people, to the effort of linking essence to appearance. It is the new vision of the landscape, in which the human being, the gesture, the seed, the plant, the city and the grandiose territories are allied in constructive commitments. The perspectives opened, painfully or joyfully throughout history, will surely find considerable parts of the globe's population committed to transforming their projects into systems open to a continued humanism..."

(MOTTA:1984:42)

As we can see, the entire development of the geographic thought unfolded from the discussion of the relations between men and nature (MORAES. 2005). While the urbanistic thought was born from the organizing ideas of the territory, the course of the geographic thought started from the founding works of determinist geography to the most recent works, all of them of empirical character. Later, the multiple strands of human and critical geography, in the more contemporary geographical thought, also found the city as an object of study, as a humanized landscape.

Written by a philosopher at the end of the 1960s, the work "The Right to the City" (LEFEBVRE:1968) inaugurates one of the modifying strands of current geography and urbanism.
"... The theory that could legitimately be called urbanism, which would bring together the significations of the old practice, called "dwelling" (i.e., the human), which would add to these partial facts a general theory of urban times-spaces, which would indicate a new practice arising from this elaboration, this urbanism exists virtually. It can only be conceived as the practical implication of a complete theory of the city and the urban, which overcomes the current splits and separations. Especially the split between philosophy of the city and science (or sciences) of the city, between partial and global. Current urbanistic projects can figure in this path, but only through an unabashed critique of their ideological and strategic implications.

"... the method consists in overcoming both description (ecological) and analysis (functional, structural) without, moreover, overcoming them, in order to tend towards the apprehension of the concrete -of the urban drama-, the formal indications coming from the general theory of forms. According to this theory, there is a form of the city: meeting, simultaneity, encounter...". (LEFEBVRE:2001:126)

From these encounters, the very vision of the Urban evolved over time, due to technological transformations that allowed man to extend his capacity for environmental and landscape transformation beyond the city limits, deploying his works, objects, and engineering systems to ever greater distances. The walled city, the undisputed seat of power and achievement, was then put in check, as well as the consumer society and all the apparent rationality of traditional urban science. MUNFORD, in his writings on the History of the City, originally published in 1961, states it well:

"Nevertheless, there is a remarkable difference between the first urban age and our own. We live in an age in which there is a multitude of technical advances without social meaning, divorced from any other purposes than the progress of science and technology. In reality we live in an explosive universe of mechanical and electronic inventions, whose parts move at a rapid pace, moving further and further away from their human center and from any rational and autonomous human purposes. This technological explosion produced a similar explosion in the city itself: the city burst forth and spread itself, in complex organs and organizations, across the landscape. The walled urban container, in fact, not only broke up: it was also largely demagnetized, with the result that we are witnessing a kind of degeneration of urban power into a state of occasionality and unpredictability. In short, our civilization is losing control, overcome by its own resources and opportunities, as well as by its superabundant fecundity..." (MUNFORD:1983:42)

In fact, it was about the glimpse of a process that would still take place here, in South America, precisely facilitated by the advances in technology and the formation of another urban space, which would transcend the limits of the city. The urban systems already clearly extrapolated the physical limits of the cities by the end of the 1980s (SANTOS, 1985). Cities, in turn, still represent the PLACE of concrete relations, the materiality closest to SPACE, where collective actions take place, the PLACE of the most fundamental human experiences.

The landscape potential is then the driver of a synthesis process aimed at environmental design and planning. The correct reading and interpretation of the landscape, as an object unveiled from its main angles, can become an instrument for environmental modification. The landscape can also be considered a temporary portrait (because it changes every moment) of the environmental transformations, considering the dynamics of the processes of environmental transformation of a place.
The construction of places, through technique, also takes on an increasingly cultural meaning. Art occupies another place in the history of human making, in search of common artifacts from the history of ordinary men.

Industrial archaeology, a term coined in the 1950s by Prof. Donald Dudley of the University of Birmingham (HUDSON: 1979), frees men from formal history, based on narratives about great deeds and personalities. Classical archaeology had already begun this work to some extent, when it brought to light not only the palace, but also the slave house.

Humanity becomes aware of its human condition throughout time, in the most everyday scenes and situations. In the modifications of the landscape by the productive needs and human work, "places become a set of increasingly technical objects". Space, then, goes from being a condition to an instrument of human actions (SANTOS, 1989).

4 TOWARDS AN ARCHAEOLOGY OF THE LANDSCAPE OF THE PRESENT

"Modern art has expanded the territory of creativity: it has unveiled new forms of knowledge of matter; it has also recovered the consciousness of doing. It has de-alienated technique and annulled the mystification of the means, in numerous immobile conditions of our society. The vision of landscape was renewed. Since impressionism, this vision contained its abstractions, resulting from the experience in the industrialized city. With this capacity of detachment, artists began to "read" reality deeper and deeper, farther and closer. They became aware, thus, of the subordinate conditions peculiar to city life. The transformations in the forms of coexistence imposed the improvement in the investigation of language, aiming at emancipation. The simplest gestures, the most precarious materials, the most remote conquests of History and also the contributions of people and peoples considered as marginal to this same History acquired greater significance. (MOTTA:1984:2).

The extent and intensity of transformations on Landscape are remarkable facts "of the technical-scientific period" (SANTOS, 1986), where information precedes action, where the connectivities between places are necessary for the maintenance of increasingly complex systems, where the objects themselves are also information. In this way, the landscape in general should be seen as the great receptacle of information that the walled city once was for historical studies.

In fact, contemporary Nature represents a set of resources that are easy to locate - no longer restricted to a certain territory - due to technical advances that nowadays allow remote soundings, research and recognition of localized potentials, predominantly minerals and energy. Large geographical objects are then created, since the insufficiency of technical instruments for the maintenance of the structures of the period entails the transformation of tangible space into instrumental space. The production sites become the basis for the installation of infrastructure, where the processing of the landscape begins to precede production itself, where environmental changes result from the geographical suitability for the desired production.

Dams, for example, are cultural geographical objects. They are part of the set of engineering systems that belong to the local technological network, records of a technical-scientific moment. They bear witness to a moment of civilization, marks on the landscape of a kind of urbanization spreading through the
countryside, and already have their own evolutionary history. To each of the artifacts that are installed in the pre-existing landscape we can attribute meanings. These meanings are associated with local signs, and there is an intense overlap of cultures in their construction. The changes on the waters through the reservoir, for example, bringing economic and social impacts, do not fail to bring great alteration to the local landscape picture, like those of the Tietê River along the state of São Paulo (KAHTOUNI:1993), closer to our reality and associated with the design of gigantic "works of art" and human ingenuity, of pre-industrial origin.

According to HUDSON:1979, the dams of Spain, built in the days of the Roman Empire, inspired later hydraulic technologies used all over the world. In a landscape with a hostile and stony climate, the construction of large reservoirs was necessary for the supply and irrigation of the colonization centers. These techniques persisted through the Christian period, with the presence of these relatively gigantic constructions, taking advantage of geographical accidents provided by the nature of the place. The dam of Alicante, built on the Monegre River is one example. Built between 1579 and 1594, it symbolizes one of the great human interventions of the new unified Kingdom of Spain.

In the twentieth century all tangible space is transformed into networks and systems of fixed and flows, with cities as nodal points, where the superposition and connections of circuits take place. Today we are dealing with a true "techno-sphere" (SANTOS, 1989), an increasingly artificialized nature, marked by the presence of large geographical objects, idealized and built by man, articulated in systems. It is possible to describe such systems, measure them, and evaluate their impact on local, regional, and global life and landscapes. This same space is, at the same time, a condition and a support for human actions. A condition that is no longer determining, but making alternatives possible. And support, within the new concepts of Landscape and Environment. In this period "Places are distinguished in Space by the quantitative and qualitative load of information. They are stocks of culture". (SANTOS,1989).

This new landscape archeology, focused on understanding the present, may represent a point of convergence between projects focused on process design, environmental issues, and impact surveys, and project currents that focus on landscape architecture as an expression of human art.

The reading of what pre-exists under a point of view that overcomes what is merely apparent or what is merely ecological, can rescue a representative memory of a society in transformation, which takes care of its heritage. The overcoming of the ideal of heritage necessarily related to the fact of antiquity already brings the possibility of using the precepts of industrial archeology (HUDSON:1979;) to identify the elements that should remain or be destroyed/transformed. The understanding of technical, social and cultural motivations within a vision of the civilizing process and the consideration of everyday objects of a collective history as samples of a creative and also artistic activity transcend the apparent oppositions between men who seek art and those who seek the nature of Place.

This dilemma should not exist in the societies of the future. It was created by ourselves. This dichotomy does not exist, it is actually a fruit of our mind and our subjections.
Technical or technological production also shapes artifacts that represent the idea of Place. Territoriality manifests itself in a very concrete way through geographic objects. As we can unveil the industrial processes that generate the configurations found and their whys, we will be expanding human consciousness about space and the landscape of the human environment.

We are talking about prospection through testimonies and objects, a true superficial archeology, based on cartographic, iconographic, and field surveys. A set of prospections capable of listing the testimonies of a certain moment or moments materialized in that present and perceived landscape, as already recommended by geographers and landscape architects. The conceptual and methodological elaboration of the use of history in intervention-oriented diagnoses is necessary.

The archaeological instrumentation is quite exquisite, considering something different from the stereotypical excavation methods, which we imagine as the only means. That is not what we are talking about.\(^8\)

In the urbanistic field, the discussions brought by the post-modern movements of the 1980s have also borne fruit. The old antagonism between urban renewal and extreme preservation has been overcome.\(^9\) Aldo Rossi’s (ROSSI:1883) precepts, configured in the 70’s, here recently published, went methodologically through the "landmarks", and the structuring elements of the city. In this search, historical issues guided the indications. It was about the link between elements of the urban landscape's concreteness and symbolic elements and the functionality present in the city's space. In a European context, this could be done very easily. We must also remember the available instruments and the real possibilities of popular participation that occurred in the Bologna experience and the beautiful work of Giulio Argan.\(^10\)

We must not forget that, from the 1960s on, new instruments for reading and understanding the urban landscape formulated by neo-humanism and by the psychological or gestalt-influenced approaches were proposed to help study the configuration of scenarios closer to the user's scale, bringing important conceptual contributions (LYNCH, CULLEN); but they are still used here as a kind of prescription that justifies technical action, often without taking into account the effective participation of space users.

On the other hand, in the field of the so-called "environmental evaluation of enterprises", the methodologies are still being improved and incorporate an important fact: the mandatory participation of the population affected by future enterprises through a seat in the deliberative councils on licensing, despite the difficulties still experienced. The discussion of the feasibility of the developments goes beyond, in

---

8 It is worth remembering the lines of work already developed by professors and architects Julio Katinsky and Ruy Gama (the latter already deceased), from FAUUSP, by Ulpiano Bezerra de Menezes, among several historians, and by technicians from DPH, founded in the late 1970s in São Paulo, more focused on industrial archeology in buildings.

9 I well remember having written my graduation paper about Brás in 1986, later published in the Revista Projeto (KAHTOUNI, 1988) in the midst of this climate of discussions among intellectuals, especially about the neighborhood of Santa Ifigênia. I have a strong memory of having experienced as a student several polemics of that time, when there were also discussions about the complete removal from the city of Luz, Santa Ifigênia and Paulista Avenue.

10 From the 1960s on, the concepts of a new form of studies about art, cities, and Architecture emerged, interrelating the created objects and the urban political cultural contexts, mainly European.
theory, their economic aspects, and other priorities are discussed. The landscape issue is part of this new repertoire of discussion and approval of projects, within a new, more comprehensive vision.

In these works the professional archaeologist is already inserted. However, it can be seen that the instruments for evaluating the impacts mainly incident on landscapes are still restricted to mistaken visions of the society x environment interrelationships, whose legal instruments are very recent.

Besides the physical accessibility of public spaces I advocate accessibility to the memory of the landscape. A reading of processes. A retaking of a lost consciousness in the hustle and bustle of the city, which makes citizens no longer recognize their places and destinations. I propose the retaking of the sense of Country, through the unveiling of the present configurations, opening one by one the layers that form its current situation, from the most recent ones, many times already forgotten and hidden, of difficult collective visualization, incorporating new researches about the landscape configuration, as in the work I did about the waters of São Paulo (KAHTOUNI, 2003).

When the designer analyzes his land or the city where he works, he must ask: what are the processes that take place in the transformation of the everyday landscape and are not conscious or captured by passers-by? After all, what are they doing there? What have they recently done there? The processes are still very little registered and unknown. They go unnoticed. And the landscape is undone and remade in time, in an ever more immediate time, by the current technical possibilities.

When you pass by an abandoned mining operation, next to a road, and you don't even know why those marks appear on the ground, or why there are those big holes. When you drive by a landfill full of garbage and covered up, and you don't even know what is there. When an architecture student realizes that he doesn't know where the materials he specifies come from.... or even doesn't know where the leftovers go....

Product life cycle awareness, part of contemporary environmental understanding has to go through this new landscape reading, in which processes will be unveiled and the very close memory should be exposed to the city people or urbanized people who walk through places close to large technological objects exposed in the new landscape configuration. This vision can be incorporated into the methodological principles of new research on our contemporary landscape. Like when we pass by an avenue and we don't know that there is a river underneath it...

In Europe, industrial archeology has advocated technological museums associated with the production sites themselves, reinventing uses for degraded and abandoned areas. We could intentionally work the marks of this recent past, left at the locus of the proposed new spatialities. This would allow the creation of a new accessibility to places, tangible through the cultural relationship they establish with society. Ulpiano de Meneses when reflecting on "the cultural uses of culture" (MENESES: 1996:94) proposes cultural policies that concern the totality of social experience and not only segments of society or its experience. He says:
"... The dominant tendency among us takes culture reductively as a compartmentalized, privileged segment, instead of locating it in the totality of social life. On the contrary, we see one more added to the various levels and instances of social phenomena (economic, political, religious, etc, etc, etc), even though it is considered important. This concentrating and spasmodic vision of culture is embodied, for example, in the culture centers. The very term center introduces as necessary the idea of periphery. To privilege the center is to be uncommitted to what is not central. It is to hierarchize the spaces of social life and qualify them in a discriminatory way... "(MENESES. 1996:94)

Finally: interdisciplinary teamwork is fundamental in the design of a new environment inserted in the process of landscape formation. Only history, in the dialectical and procedural sense, brings the real dimension of transformations, which are successive and overlapping within the cultural landscapes we create.

From then on, a new Architecture will be given, the Landscape Architecture.

Principles and Concepts for development in nowadays society - The landscape archaeology as an environmental project instrument

CHAPTER 120

The impact of the Pandemic on the family context and on the management of teaching work for women

Aline dos Santos Moreira de Carvalho

ABSTRACT
This article is about the landscape comprehension using concepts as a scientific period and the informational media and the interfaces between technology and the infrastructures, becoming necessary the review the recent accumulated layers on the landscape. The cultural landscape transforming, the urban landscape layers, processed at the time. This new methodology has an important role for the urban projects future applications.

1 INTRODUCTION

Today, women still seek and aim for their professional affirmation and as a social subject, living and reliving the debate on gender, equality and the labor market.

The teaching profession was the first open door to the female labor market, for reasons of a historical-cultural nature.

The woman, in Brazilian society, considered patriarchal, until a few decades ago was created to be a good wife and mother, responsible for housework, which made the female mentality internalize this responsibility.

In this context, today, in the face of the COVID-19 pandemic, the situation that was once veiled, was laid bare in the face of social distance and the need for remote classes for students, that is, the teachers-mothers who were previously overloaded, now find themselves in balance between work, students, home, family, self-care, health, leisure, etc.

The present study aims to rescue concepts such as woman and feminine identity, as well as teaching identity, in the historical-cultural context, relating them to the current contemporary and pandemic situation of women who are teachers, mothers and wives.

To this end, a bibliographic research was carried out, which according to GIL (2008) is developed based on material already prepared, mainly in scientific articles and books.

An analytical reading was carried out, relating concepts and statements based on articles, research and studies, which resulted in three correlated topics: woman, feminine identity; Woman and being a teacher; and Woman, teacher and mother in the pandemic-balancing.

The conclusions as well as the author's impressions comprise the final considerations.
## 2 WOMAN, THE FEMININE IDENTITY

According to Oxford Languages, woman means “1. Female or female person; 2. The female human being, considered as a whole, ideally or concretely.” (LANGUAGES, 2021, online)

According to Vieira (2005), each period, in its own way, influences the subjects in their ways of thinking, acting and feeling. According to the history of humanity, many periods were decisive in marking the construction of identities such as the Middle Ages, the Renaissance, among others (VIEIRA, 2005).

The author states that in order to build the self, that is, himself, it is necessary for the subject to add specific tendencies of knowledge, assimilating the particularities and values of certain moments.

For Giddens (2002 apud VIEIRA, 2005), post-modernity made the subject susceptible to fragmentation, reducing the value of subjectivity. From this perspective, the construction of the subject results not only from a moment or fact, but from a series of events that happened in a person's life. Thus, each subject has their particular, unique and singular historical path, where emotions, losses, gains, beliefs, with judgments and values added during their life are.

Still from this perspective, it is emphasized that the subject is not just a spectator of his life, he intervenes and interferes in the construction of his subjectivity.

> However, we are not passive users of pre-made speech sources. It is true that they exist and they limit us and shape what we say, but when we speak, we always use them in new and varied combinations. In this sense, we can be considered genuine authors.

With regard to the discussion of female or female identity, Vieira (2005) emphasizes that it is through the negotiation of identity and differences that the subject is constituted, resulting from an ideological process.

In this sense, the woman's identity results from differences, not being unitary. M. Talbot (1995 apud VIEIRA, 2005) states that the critical perspective agrees with the idea that the genre is not previously received, nor is it static, but actively constructed, some studies claim in constant dynamic construction, where this characteristic ensures the permanent change and incompleteness (VIEIRA, 2005).

Vieira adds that the subject's identity cannot be seen as the exclusive property of a being centered and limited by genders, rather it is hybrid and inconstant. Thus, Emilia Pedro (1997 apud VIEIRA, 2005) is conclusive in saying that what and who we are is the result of the relationship between the subject (the self) and the other.

However, identities are from very early on, the identities of women and men are constructed in the social context, such as gender identities. These are the result of a model of social behaviors learned from the family and from other social institutions. In this perspective, Vieira (2005) states that it is up to the family to build a female identity. Just as Simone de Beauvoir said “a woman is not born”, this being made, as a kind of world in construction and changes, and its color reflects in the contemporaneity with qualities, errors, weaknesses and failures of being a woman.
When entering the subject of literacy or schooling, one can see the ideology that female and male roles are well differentiated and literacy depends on each one will exercise.

According to Cornes (1994, p. 105 apud VIEIRA, 2005, p. 229), Jean Jacques Rousseau described female education as follows:

The complete education of women must be relative to men, to please them, to be useful to them, to make themselves loved and honored by them, to educate them when they are young, to care for them when they are grown up, to comfort them. and to make their lives sweet and pleasant. These are the obligations of women at all times and this is how they should be taught from childhood.

In this sense, education contributes to the characteristics that deepen the differences between the genders, reiterating the value of culture and thus, making the female identity a reflection of the beliefs, values and customs of each social group.

According to Vieira (2005, p. 228), in order to reflect on female identity and education, attention should be paid to the curricular issue, as it reflects the role of society and its ideological values in the construction of female identity, such as courses Brazilian normals, aimed at female training, where they were taught from childcare to singing, going through home economics, without teaching physics, biology and chemistry. The ideological discourse consisted of the young woman being trained as a teacher (magisterium) and getting ready to marry, as she could only work one shift, better in the afternoon, to reconcile the chores of a wife and mother with work.

3 WOMAN AND BEING A TEACHER

Neves, Brito and Muniz (2019) observe that, historically, female insertion in the labor market takes place through professions that have similarities with the domestic sphere, with “care”, home and family activities, such as teaching. (NEVES; BRITO; MUNIZ, 2019).

Historically, due to increasing urbanization with the Brazilian industrialization process, there was a need to expand education, and the men who worked in the teaching profession withdrew. Including, in this perspective, that the woman is considered as one who knows how to perceive and exercise the teaching profession with mastery, a function learned since childhood, once born in a patriarchal society (NEVES; BRITO; MUNIZ, 2019).

Being a teacher gains a sense of the process necessary to put into practice the skills and abilities that are innate to being a woman, not being seen as qualifications, which generates devaluation of female work and lower wages (NEVES; BRITO; MUNIZ, 2019).

Pessoa, Moura and Farias (2020) add that teaching is configured as a close relationship between women and the labor market, quickly associated with the feminine. Configuration reaffirmed by the fact that in this profession there is the possibility of reconciling work and family, not interfering in their performance as mother and wife (BRABO, 2005 apud PESSOA; MOURA; FARIAS, 2020).
According to Chamon (2005 apud NEVES; BRITO: MUNIZ, 2019), acceptance in the teaching profession is linked to the demands of commitment to discipline and education of children, first of all. In the social context, women have innate characteristics (vocation) to take care of children and superiority in affective relationships.

Teaching is a profession full of social interactions, making it flexible to what happens in society as a whole (PESSOA; MOURA; FARIAS, 2020). As Tardife and Lessard (2011, p. 43 apud PESSOA; MOURA; FARIAS, 2020, p. 167) add, teaching is “acting within a complex environment and, therefore, impossible to fully control, because, simultaneously, there are several things” that are produced at different levels of reality”.

According to Almeida (1999, p. 32 apud GIL, 2020, p. 78), women enter the teaching career because they represent the necessary and acceptable balance within their specificity,

Therein lies the extreme ambiguity of the female position regarding work and education, represented by the balance between the desirable and the possible condition to obtain. The teaching profession, due to its specificity, was one of the greatest opportunities that the female sex had to achieve this balance. It was acceptable for women to do a job as long as it meant taking care of someone.

Another striking view of the presence of women in teaching is that this career has the characteristic of a priesthood for women, a mission that transcends the domestic sphere, from children to students, and should be done voluntarily, as shown by Dametto and Esquinsani (2015). , p.150 apud GIL, 2020, p. 79):

In order for school expansion at the expense of female labor to be palatable, there was an investment in representations about women and teaching that led to interpretations that have persisted for a long time, such as the idea of teaching as a mission or priesthood, in addition to being a natural feminine vocation.

The teaching profession can be considered the gateway for women to the labor market, even in the face of the devaluation of female labor and the profession, lack of social prestige and the wage struggle (GIL, 2020).

4 WOMAN, TEACHER AND MOTHER IN THE PANDEMIC - BALANCING ACT

The Corona Virus Disease (COVID-19) emerged in China in 2019 and spread to other countries on the planet, being declared by the World Health Organization (WHO) in March 2020 as a pandemic and the biggest public health emergency faced by the world. society in recent times. In this context, the need for social distancing and isolation (in some cases) was declared, which became everyone's duty. As Bittencourt (2020, p. 171 apud MACÊDO, 2020, online) stated "staying at home is a political act”.

However, Macêdo (2020) points out that domestic work, whether formal or not, in Brazil, is entirely the responsibility of women, representing the difference that still exists between men and women. And that for many, this work represents oppression, pain and suffering in the face of the imposition of a subordinate place to that of man, both in society and in the traditional family hierarchy. And he adds that this situation,
in the face of current and aggravating issues, is leading women to exhaustion, since this condition was internalized by them (being responsible for all the tasks), which implies little or no care for themselves and no leisure (MACÊDO, 2020).

Regarding the teaching profession, the pandemic period and its consequences brought to reality Remote Teaching, through which students and teachers work the teaching-learning process through digital technologies. (GIL, 2020)

The Education Guidelines and Bases Law - LDB 9394/96 provides in emergency cases for the use of distance classes to collaborate in the development of teaching, the National Common Curricular Base reaffirms the skills and abilities to be developed with the use of technologies in education both in an interdisciplinary way as a collaborator in teaching to bring educational practices closer to the context of students immersed in technology, meeting the need for comprehensive training. (GIL, 2020, p.79)

Gil (2020) states that, as a professional, his teaching identity was oversized, since he had to work in the home environment, without correct schedules, in the midst of family needs. (GIL, 2020).

Ataíde and Nunes (2016, p. 172 apud GIL, 2020, p. 81) when discussing the identity of the teaching profession add:

Understanding the identity of the teaching profession as a result of a historical process of social construction based on social, cultural, political and economic factors, proves to be imperative for its characterization and differentiation in relation to other professions. [...] Therefore, the identity starts from the fusion of elements that characterize individuals and located in time and space in order to make them unique, unmistakable in the set of their thoughts.

Gil (2020) adds that it is necessary to reflect on this teacher identity, because within the current pandemic context, the woman teacher stands out because, in addition to the teaching aspects and their consequences, she needs to be a woman, mother, wife, articulating the care family members and the demands of work, in a process of functional juggling.

Juggling is routine and everyday life for women teachers and mothers during the Pandemic. Macêdo's study (2020) organized some reports of women in this situation.

I remember, when I wake up, that, because of the pandemic, there is no rigid schedule to follow. But I can't stay in bed. I once read an article that presented a research with women, entitled "There's no way for me to wake up today and say: today I'm not going to be a mother!": work, motherhood and support networks", by Souza, Teixeira, Loreto and Bartolomeu (2011). This sentence is our face. Mom is 24/7. The obligations I have internalized as a mother, wife and housewife invite me: breakfast, housework, lunch, dishes, clothes, dinner, bed, table and bath. So, it's not that I don't feel good next to the ones I love. The exhaustion is in having to do activities that I can't stand to do and, even though I can play and roll around, watch movies and TV, I get so tired with household chores that I often can't even read, something important for my profession. Sometimes I think I'm farther away from the ones I love when I'm at home than when I'm working hard. Because when I take care of my professional work, I stay for them, for them...

However, not going to work in person is too complicated. Being out of contact with my students, away from supervision, guidance, away from the place that makes me think, produce and fulfill myself, is a martyrdom. I recognize myself in my work... I have dreamed of this since 1989. I have been a teacher since 1998 and at a public institution since 2012. I...
love what I do, I love the classroom. I feel ecstatic when producing articles, designing projects, participating in events, giving guidance, traveling, meeting new ideas at conferences...

Fabbro and Heloane (2010 apud MACÊDO, 2020), when stating about the themes of women, academic work and motherhood, stated that for the teachers intellectual work proved to be seductive, which made them feel alive because they felt they were part of something great for future generations. In contrast, many felt guilty about their family and were overwhelmed.

However, it should be noted that research has pointed to another face of juggling, as a positive aspect: contact with the family, especially the children (PESSOA; MOURA; FARIAS, 2020).

There was the possibility for teachers to have time to reflect on their needs, interests and needs that were not evident due to the fast-paced routine of everyday life, before the pandemic (PESSOA; MOURA; FARIAS, 2020).

Oliveira, Queiros and Diniz (2020 apud PESSOA; MOURA; FARIAS, 2020), collaborate that closer family contact has changed the domestic dynamics because everyone is at home. And this is seen by the teachers as something positive.

Antunes (2009 apud MACÊDO, 2020) considers that work is one of the spheres that gives meaning to human life and that favors facing the suffering resulting from it.

As the woman has internalized cultural values of a mother-centered culture, she begins to face identity conflicts for sharing the ideology that a woman needs to be good: a good mother, a good wife, a good housewife, a good cook, among others. (MACÊDO, 2020)

Therefore, the same situation presents different sides of the functional balance of the contemporary woman, teacher and mother.

5 FINAL CONSIDERATIONS

The contemporary woman is a tightrope walker by identity and need. There are countless daily situations lived, participated, attributed and shared.

The woman who is a teacher and mother of a family assigns her numerous responsibilities, including the social responsibility of being good.

In the current pandemic context, many aspects of this conflicting teacher-mother relationship came to light due to the need to make their home their classroom, since individuals needed to distance themselves.

Therefore, the tightrope walker did not enter the scene, she just needed to be highlighted in front of the curtains at that moment.

It should be noted that the balance “falsely” found by many requires emotional, physical and psychological exhaustion, being just a very subtle and easily destabilized state.

ABSTRACT

The different soil management systems, such as no-tillage and conventional planting, as well as crop rotation and succession, promote changes in the soil, altering factors such as the availability of water, oxygen and substrate, directly affecting the soil microbiota. The objective was to evaluate the effects of the management of intercropping systems with the presence of the legume gliricidia, without gliricidia and native vegetation on soil microbiological attributes. An experiment was carried out under field conditions, in an area of organic management of land use, cultivated with legume gliricidia, fruit trees and forest essence. The design used was in randomized blocks, in which ten soil samples were collected in triplicate at two depths (0-10 and 10-20 cm). The samples were homogenized and sieved in sieves, placed in properly identified plastic bags and subsequent analysis of the microbial attributes (microbial biomass carbon-Cmic, microbial biomass nitrogen-Nmic, metabolic quotient-qCO2 and basal respiration (RBS)). that the cultivation systems caused significant alterations in the microbiological attributes of the soil when compared with the native vegetation. of the native vegetation, while the values of Cmic, RBS and qCO2 did not differentiate. These results confirm that the intercropping systems with the presence of gliricidia was equal to the native forest, in providing favorable conditions for the mineralization of organic matter by the soil microbiota.

Keywords: Sun management, Vegetables, Microbiota.
1 INTRODUCTION

Soil is a living and dynamic natural resource that enables and sustains the production of food and fiber, regulating the global balance of the ecosystem, which is closely linked to the particularities and processes that occur in the atmosphere, hydrosphere, lithosphere and biosphere (Silva & Mendonça, 2007), fundamental for agricultural production. Among all the resources natural resources, the soil is a non-renewable resource on a human scale and has been suffering in recent years several degrading processes, making it necessary to adhere to agricultural practices, such as prevention for degradation not to affect new areas and that Keep capacity productive of same (Cavalcante et al., 2012).

Soil quality is defined as its ability to sustain and maintain biological productivity within the ecosystem, maintaining environmental quality and promoting the health of the plants and animals encompassed therein, and it can be evaluated using physical, chemical and biological indicators (Leal et al., 2021). Soil quality is a property of sustainability of cultures, also influencing the health of plants, animals and consequently in human beings (Melo et al., 2017). Soil is a naturally diverse habitat, with highly complex biological communities in which are different forms of microorganisms, both eukaryotes and prokaryotes, that interact in an environment dynamic and in state of balance (Carrer Filho, 2002).

The living microbial components of the soil are also called microbial biomass and bacteria and fungi account for about 90% of soil microbial activity (Andreola & Fernandes, 2007). The soil has an immense diversity of the microbiota, being the main activities of the organisms the decomposition of the OM, production of humus, nutrient and energy cycling (including atmospheric nitrogen fixation), production of complex compounds that contribute to soil aggregation, decomposition of xenobiotics and biological control of pests and diseases (Moreira & Siqueira, 2006). The population of microorganisms in the soil is a component of paramount importance in the transformations of matter organic of ground, then Those use Those materials as source in energy and nutrients for The formation and Ocellular development, thus causing temporary immobilization of carbon, nitrogen, calcium, magnesia phosphor, sulfur and micronutrients, you which after The death From microorganisms, will be made available for at plants.

Soil organic matter represents the main source of energy for microorganisms and nutrients for plants, and their changes can indicate the degree of preservation or imbalance of natural ecosystems. In this context, the sensitivity of chemical indicators may not be sufficient to indicate changes that have occurred with the material organic of ground, for the replacement gives forest per activities agrosilvopastoral, having The need in select indicators, as you biological, what be sensitive The small changes at the system soil-plant, with that you microorganisms can be used as sensitive indicators of soil quality. Some of the main indicators soil quality microbiological factors are the biodiversity of microorganisms, the microbial biomass (BMS) the respiration basal it's the metabolic quotient (Araújo & Monteiro, 2007).

However, in isolation, the microbial biomass (BMS) little reflects changes in soil quality, despite to be an indicator of anthropic interventions (Brookes, 1995). However, BMS associated with organic matter content can be used as indices to compare soil quality under different managements. Although, BMS’s answer
is faster, if compared to the content of organic matter (Jenkinson & Ladd, 1981). These authors suggest that the changes in BMS content long-term predict soil organic matter content. The microorganisms decompose organic matter, release nutrients in forms available to plants, and degrade toxic substances (Kennedy & Doran, 2002).

Green manures perform important actions in the soil such as: protection from the impact of rains and also against moisture loss; disruption of densified and compacted layers over time; increase in the content of mattersoil organic; increase in the capacity of infiltration and retention of water in the soil; Decreased Al and Mn toxicity due to complexification and pH elevation; promoting the rescue and recycling of easily leached nutrients, extraction and mobilization of nutrients from deeper soil and subsoil layers, such as Ca, Mg, K, P and micronutrients; extraction of phosphor fixed; fixation of No atmospheric in manner symbiotic by legumes; inhibition gives germination and of plant growth invasive, whether by effects allelopathic, whether by the simple competition per light (Silva et al., 2020)

Thus, green manure has several beneficial functions for the soil, with an increase in biological diversity in the soil. production unit provides changes in the dynamics of invasive species, in the population dynamics of insects, pests, predators and pollinators. In addition to influence the qualities physical, chemicals and biological soil (Espíndola et al. al., 2004).

At practice gives fertilizing green he can if use so much grasses as legumes, at the ent you waste in legumes can contribute to the reduction of acidity of soil and the C/N ratio in soil organic matter and residues of grasses has a higher lignin content, favoring the structuring and stability of aggregates, making them less susceptible to compaction (Andrade et al., 2009). However, for green manure, legumes have been used more often due to their atmospheric N2 fixation potential through the symbiotic association of bacteria of the genus Rhizobium and Bradyrhizobium, which, in addition, has a deep root system, capable of exploiting nutrients from the deepest layers of the soil. You effects chemicals at the ground provided for the fertilizing green depend in factors as: species used, O management aimed at biomass, planting time, cutting of green manure, the time the residues remain in the soil and the interaction between Those factors (Alcântara et al., 2000).

Souza et al. (2020), evaluating biological fixation and nitrogen transfer by Gliricidia sepium in an orchard organic intercropping of orange and banana found that the amount of N made available through green manuring supplied in 55% of the nutritional requirement of crops (oranges and bananas). This amount of N supplied by gliricidia pruning was enough to supply the N demand of the orange plants, in the formation phase, with that the same author reports that The use of Fabaceae that have a high potential for biological fixation of nitrogen (NFB) and of production of biomass, as green manures in orchards, in addition to providing savings on fertilizers, contributes to the ecological management of the orchard. Thus, the objective was to evaluate the effects of the management of intercropping systems with the presence of the legume gliricidia, without gliricidia and vegetation native about attributes microbiological of ground, per quite gives analysis gives biomass microbial, breathing basal and nitrogen from microbial biomass, managed in organic form.
2 METHODOLOGY

This is an exploratory research of a quantitative nature (Pereira et al., 2018). The experiment was developed at Instituto Federal Roraima - Campus Novo Paraíso, located in the municipality of Caracarai, Roraima, under the coordinates 1°15’7.86 N and 60°29’14.18 W. The weather type is tropical rainy, with annual rainfall totals relatively high, arriving The two 000 mm second The classification in Koppen. With temperatures averages in 26.8 °C The soil of the study area is classified as Argisol Dystrophic Red Latosol (Embrapa, 2013), with the physical and chemical properties described in Table 1. Chemical and microbiological analyzes of the soil were carried out in the laboratory of soils and plants of federal Institute from Roraima - New Campus Paradise.

(CGL) system in cultivation consortium with gliricidia; (SGL) system in cultivation consortium without gliricidia; (VNM) vegetation native – Woods;

The treatments consisted of three areas with different management and use (area in intercropping with gliricidia (Gliricidia sepium (Jacq.) Steud.) + fruit (Citrus sinensis L. Osbeck), banana (Musa spp.) (CGL); area with intercropping of orange and forest essence (Ipê - Handroanthus heptaphyllus) without gliricidia (CSG) and the area of native vegetation (forest) (VNM) used as a reference. Each 1600m² area was divided into five plots, of which each one was subdivided in two subplots, in the which were collected samples in ground at rhizosphere of plants, in the depths of 0 – 10 and 10 -20 cm. The design used is a completely randomized block design with a factorial arrangement. (3x2), with three soil management and land use systems (legumes + fruit trees, fruit trees + forest essence and vegetation native - forest) and two soil collection depths. Thirty soil samples were collected in the three study areas in the depths in 0.0 – 10cm and 10 – 20 cm, with three repetitions in your respective depths totaling 90 samples. The samples were packed in sterile plastic bags, properly identified, and stored in a cold chamber at 4ºC (Sarathchandra, 1978).

In the samples in ground in laboratory were done O process in squeegee in sieve in mesh two mm in opening, where all animal and plant residues were removed. For the analysis of basal respiration determination (RBS), it was determined according to Jenkinson and Powlson (1976), using 20 g of each soil sample were incubated for 168 hours at room temperature in 0.5 liter hermetically sealed flasks and the CO2
captured in 100 mL flasks containing 10 mL of a KOH solution (0.3M). After incubation, 3 mL of BaCl₂ was added (20%) and the excess of KOH was determined by titration with HCl solution (0.1 mol L⁻¹). For the extraction of carbon and nitrogen from the biomass (Cmic and Nmic) 60 mL of a 0.5 M solution of K₂SO₄ were added to the soil samples that were subjected to agitation (40 min; 150 rpm), followed by decanting for 30 minutes. Then, the samples were filtered through filter paper for separation from the extract to posteriorly determination of Cmic and number.

Determination of Microbial Biomass Carbon (Cmic) was carried out by the fumigation-extraction method, according to Vance, et al., (1987), using the correction factor (kC) of 0.33 recommended by Sparling and West (1988), in order to express the fraction of Cmic recovered after the fumigation-extraction process. Determination of Nitrogen from Biomass microbial (Nmic) was performed by the fumigation-extraction method with the extractor soil ratio of 1:2.5 (Tate et al., 1988), with the addition of chloroform directly to the sample, keeping them in a dark place for 24 hours, continuing extraction and quantification of microbial nitrogen by steam distillation (Kjeldanhl), followed by volumetry of acid-base neutralization using acid sulfuric acid (H₂SO₄) as titrant.

The data of the variables obtained in each time of soil sampling, distinctly, were submitted to analysis of variance and the results of the means of each treatment were statistically analyzed using the SISVAR program, version 4.3 (Ferreira, 2014). You effects From treatments will be compared for test of tukey The 5% in probability.

3 RESULTS AND DISCUSSION
Higher values of microbial biomass carbon (Cmic) were observed in soil samples of vegetation native (forest) at a depth of 0-10 cm (Table 2), with significant differences between intercropping systems with presence of gliricidia (CGL) and without gliricidia (SGL). However, at a depth of 10-20cm higher values were observed in the consortium system with the presence of gliricidia. These results corroborate those obtained by Silva et al. (2021), which cites a 356% increase in microbial biomass carbon (Cmic) in intercropping areas of fruit trees with gliricidia in relation to intercropped areas without the presence of gliricidia, at a depth of 0-10 cm. Silva et al. (2021), mentions that most microbiological activity in the surface layer of the soil is due to the higher content of organic matter present on the surface from soil. Leal et al. (2021), evaluating the effect of management systems and land use on the population of microorganisms in the soil, in areas of intercropping of fruit trees with and without gliricidia, observed a greater number of colony-forming units (UFC g solo⁻¹), in system with consortium with gliricidia.

Other factor what justifies that increment It is O management applied in this area with at pruning of plants in gliricidia being the biomass placed in the rhizosphere region of fruit plants. According to Paula (2015), the decomposition of waste from leguminous plants, can be a source of carbon and nutrients for the soil biota and later for the plants, highlighting the importance gives synchronization in between The release in nutrients by plants in consortium and your demand by cultures main. Nutrients are released by the
decomposition of waste, through pruning. Souza et al. (2020), working in a consortium of fruit trees with gliricidia, emphasize that the repeated deposition of gliricidia twigs and leaves in crowning of the fruit trees, increased O contents in organic matter of ground and consequently the microbiota, being able to extract nutrients in layers deep of ground, leaving them to reach for O growth of cultures through gives cycling of nutrients.

Results many different to the in Carbon gives biomass microbial (C_mic), were observed for O Nitrogen gives microbial biomass (N_mic) (Table 2). A significant difference was observed between the soil management systems, being in the depth of 0-10 cm, the highest values in the consortium with the presence of the leguminous gliricidia (CGL) and in the area with native vegetation - forest (VNM) respectively. At a depth of 10-20 cm, higher values were observed in the systems in management from soil CGL and SGL respectively, obtaining a significant difference each other.

CGL: System consortium with gliricidia; SGL: system without consortium with gliricidia; VNM: Area in Woods.

Values at same column, comparing systems in management of ground, in a row gives same letter uppercase, no differ in between yes (Tukey<0.05). Analysis carried out at the Laboratory in soils and IFRR plant, Caracaraí-RR, 2021.

Source: authors.

The biomass attributes C_mic and N_mic serve as indicators of soil quality (Ferreira; Wendland; Didonet, 2011); however, the use of these parameters alone is not so appropriate to determine the real metabolic state of the microorganisms of ground (Bowles et al., 2014), with that, does if required to take in consideration other attributes that express the microbiological quality of the soil. In this sense, the quantification of other parameters such as Basal respiration of the soil (RBS) and the metabolic quotient (qCO\(_2\)) contributes with pertinent information about the soil microbiota activity and the dynamic of microorganisms (Anderson; Domsch, 1990).

Regarding RBS, a significant difference was observed in all types of soil management, with the lowest value observed under SGL at both depths. A higher value was observed for the area of native vegetation (forest) and the system CGL at both depths. Thus, the greatest release of CO\(_2\), expressed by RBS, in forest
soil may be in occupation gives constant incorporation in matter organic O what promotes O increase gives biomass, resulting in larger release of CO₂ (Kuzyakov, 2010). Thus, the higher content of C\textsubscript{mic} is positively related to the release of CO₂ (Adachi et al., 2006).

When observing the values of qCO\textsubscript{2}, a high value was observed for the forest followed by the CGL at a depth of 0-10, and the forest followed by the SGL system at a depth of 10-20, this value indicates that the CO\textsubscript{2} release rate per unit in C\textsubscript{mic} It is smaller under ground with the handling CGL on depth in 0-10, and at depth in 10-20 cm, the system in SGL.

Gupta and Singh (1980) defined the process of CO\textsubscript{2} release as the sum total of all the metabolic functions of the body. soil, in which CO\textsubscript{2} is produced, this is the result of 3 processes called microbial respiration, root respiration and faunal respiration is a non-biological process, chemical oxidation which can be directly influenced by high temperature.

According to Cunha et al. (2011), higher CO\textsubscript{2} release is generally associated with higher biological activity, which, in turn, is directly related to the amount of labile C in the soil, which explains the higher values in the topsoil layer that was observed in all management systems and in the forest (Souto et al., 2009). However, according to Cunha et al. (2011), the interpretation of the results of biological activity must be done with discretion, as high values of breathing nor ever indicate conditions desirable, being able The I enjoy deadline to mean release in nutrients for at plants sand, in the long term, loss of organic C from the soil to the atmosphere (Parkin et al., 1996). Therefore, high values of C-CO\textsubscript{2} can indicate so much situations in disturb how high level of productivity of system (Islam & Weil, 2000).

Thus, in a management system there are several biotic and abiotic interactions that can interfere with the parameters soil microbiologicals. Based on the results observed for the attributes of microbial biomass, it can be infer that, compared to SGL, CGL promotes less disturbance of soil microbial biomass, providing greater C\textsubscript{mic} values and N\textsubscript{mic}, but higher values of qCO\textsubscript{2} can be caused by high temperatures and high humidity causing greater activity microbial and The oxidation of organic matter by having greater release CO\textsubscript{2}.

In general, the soil microbial biomass attributes were affected by the soil management system, being that the forest presented values of C\textsubscript{mic}, N\textsubscript{mic}, RBS and qCO\textsubscript{2} higher than those observed under CGL and SGL. The highest values observed for the parameters evaluated in the forest soil are related to the higher content of organic matter present, in comparison to solo under CGL and SGL, one time what school subjects organic promotes results beneficial to properties edaphic (Cardozo et al., 2008) and microbiological of ground (Elfstrand; et al., 2007; Elfstrand; et al., 2007).

Thus, the soil management treatment under CGL was the closest and even surpassed in some parameters the area of native vegetation (forest), thus suggesting that the agricultural activity conducted under this type of management is any less impactful under O Score by sight From indicators microbiological.
4 CONCLUSION

It concludes that the cropping systems caused alterations in the microbiological attributes of the soil in comparison with natural environment (forest). The presence of the legume gliricidia, associated with the management of plant pruning, was decisive for the elevate you parameters microbiological analyzed of ground.

The intercropping systems with the presence of the leguminous gliricidia (CGL), provided nitrogen values of the microbial biomass ($N_{mic}$) higher than the values observed in a forest environment, thus being an efficient system in use and cycling of that nutrient.

Works involving the study of soil microbiota in intercropped agricultural systems in the Amazon should be developed, for better use of available resources in rural properties in this region, given the scarcity of resources financial by farmers relatives, perspectives as other plants agricultural and legumes native are parameters that can to be analyzed and come to add this study.

CHAPTER 122

Environmental concern and environmental training in university students

Edith Meryluz Claros Guerrero

E-mail: meryluzclaros@gmail.com

ABSTRACT
The research is based on the environmentalization doctoral thesis of the José Faustino Sánchez Carrión National University, which evaluates the environmental dimension from a comprehensive point of view, addressing the problem of the perception that university students have of their professional training in environmental matters (plan curriculum, teaching methodology, content) regardless of their professional training in relation to the self-assessment of their pro-environmentalist attitudes (environmental concern). Through stratified probabilistic sampling, the size of the sample of each professional career intentionally selected to meet the objective of the investigation was determined. A questionnaire based on Melania Coya's proposal was applied to students from III to V Semester, from 10 professional schools, who valued their training in environmental matters, and the scale of environmental concern. The students surveyed obtained an environmental concern score of 44.02 points out of 65, qualifying in the medium grade, with a regular level of training in environmental matters. There is no significant correlation between environmental training and environmental concern, except for professional careers with a professional profile related to environmental issues, concluding that the environmental concern of students is influenced by the cultural and social environment.

Keywords: Environmental training, environmental concern, methodology, professional profile.

1 INTRODUCTION

The environmental problem, in itself, is a very complex issue to address, and it has become even more accentuated in recent decades, showing a considerable increase in consequences in different factors, such as the physical, biotic and social factors, which are affecting the activities and that despite the actions carried out at a global level to raise awareness of care and respect for the environment, through the issuance of pro-environmental regulations that seek environmental sustainability, it still seems that the model of social development and economic, apparently it is not managing to fully achieve the natural balance and the well-being of the ecosystems, therefore, it is necessary that the idea of sustainability is immersed and forms part of the culture of the human being, an alternative is to encourage environmental education, formal and informal, through the interaction of the various actors that make up society, including citizens, organizational groups zed by society, government, business and above all educational institutions, especially higher education institutions, to correct and mitigate the effects of the environmental crisis. Another concept immersed in environmental problems is sustainability, and as mentioned, (García, D & Priotto, 2009) this implies assuming the responsibility of improving the current living conditions of all people, other forms of life and natural systems.

The higher university institution, an area in which professionals with diverse occupational profiles are trained, who must be aware of the social and environmental reality and be active participants in the
transformation of society with environmental responsibility, as mentioned by Mora (2012) who considers that including the environmental dimension in Higher Education is imperative, and this must be done through the application of models focused on sustainable development. For its part, (Silva, 2007) it considers that by including the environmental dimension in the educational system, it should lead to new forms of relationship between human beings and nature, between them and with the rest of society, this will lead to the formation of environmental awareness as an immediate need in the preparation of future university graduates. Noguera (2007).

According to Cárdenas (2013a), university environmental responsibility is the action of the university put into practice in principles and values that contributes to the training of professionals and citizens with awareness, commitment and proactive participation in solving environmental problems, through the exercise of its substantive functions of training, research, extension and management, the author also considers that this institution must incorporate the environmental dimension into its institutional, educational and labor project.

If we analyze the national regulations, in art. 127° of the national environmental education policy of our country, mentions that: "Environmental education becomes an integral educational process that occurs throughout the life of the individual, which seeks to generate in him the knowledge, attitudes, values and practices necessary to develop their activities in an environmentally appropriate manner, with a view to contributing to the sustainable development of the country", in this sense, Peru through the Ministry of the Environment (MINAM) through the Interuniversity Environmental Network – Interuniversia Peru (RAI Peru), has a process started in 2012 (Cárdenas, 2018c); and is consistent with the provisions of the Bicentennial Plan – Peru by 2021.

An optimal environmental education with environmentally responsible values and attitudes would be to consider the environmental dimension as part of professional training, adapting the university curriculum that influences a change in behavior of the entire university community, internalizing respect for the environment and natural resources.

According to the University Law (Ley N°30220, 2014): "The university is an academic community oriented towards research and teaching, which provides humanistic, scientific and technological training with a clear awareness of our country as a multicultural reality." And among its purposes, among others, is to "promote human and sustainable development, serve the community and seek comprehensive development."

This document is based on the Environmentalization doctoral thesis of the José Faustino Sánchez Carrión National University (Claros, 2020) where a diagnosis of the environmentalization conditions in which the educational institution is located was made, being the reason for analysis the degree of environmental concern of the University student that allows to know the student's perception of environmental problems, and the level of training in environmental matters that, according to the student's
perception, they have been receiving as part of their professional training, regardless of their professional profile.

2 METHODOLOGICAL STRATEGIES OR MATERIALS AND METHODS

The research design had a quantitative, correlational cross-sectional approach, the population was composed of students enrolled in Semester 2019 - I, distributed in 13 Faculties with 34 Professional Careers, some related to environmental issues, and others that "are not related", to make a difference, the curricular plan of professional careers is analyzed, which according to regulations of the institution, is divided into three curricular areas: Area of general studies or basic training, area of specific studies or basic professional training and the area of specialty or specialized professional training, being the basic training, where competence in science is identified, technology and relationship with the physical environment, being studied in the first four cycles.

Based on the recommendations of Fox (1987, 2nd: 373) cited by (Coya, 2001) mentioning that in order to deliberately achieve representativeness of the sample, three conditions must be met: a) knowing the characteristics (variables) that are related to the problem being studied; b) have the ability to measure those characteristics; c) have population data on the characteristics to use as a basis for comparison and non-compliance with one of these conditions should justify the use of another type of method, the university population is restricted to cycles from III to VI Cycle, discarding the first cycles assuming that they do not have enough information to judge professional training and higher cycle students, to achieve homogeneity, since not all study in a competency-based plan, only one professional career is chosen from those that have related curricular plans. The population remains at 3183 students, distributed in 10 professional careers. Through non-probabilistic sampling, with conditioned criteria, the exclusions required by the research were made, surveying 278 students.

A questionnaire adapted to the reality and characteristics of the region was applied to the students surveyed, in order to know the environmental training, and for the degree of environmental concern, the Scale of Environmental Concern was used, proposed by Coya (2001), taking as base the Environmental concern Scale (Environmental Concern Scale, EPA) designed by Weigel and Weigel (1978), adapted by Holahan (1991) or Amerigo and Gonzales (1996). Four dimensions were identified for the evaluation of environmental concern: Non-personal control over the environment, which evaluates whether the student assumes control of pollution and presents the solution, Personal effort for the conservation of the environment, if the student is willing to assume some personal cost, pollution prevention and control, the student expects the authorities to provide solutions or propose alternative solutions, and irresponsible attitude towards pollution is evaluated if the student values the real importance of pollution and takes responsibility of their actions. In the documentary analysis, the review of the curricular plans was made, observing the number of courses by thematic areas, registered on the institution's website.
3 RESULTS AND DISCUSSION

For a sample of 278 students, with an average age of 20 years, made up of students from careers not related to the environmental area: Statistics and Computer Science (4%), Economics and Finance (15.1%), Chemical Engineering (10.1%), Electronic Engineering (10.8%), Sociology (9%), Nursing (10.1%), while the Schools related to environmental matters are Zootechnical Engineering (7.9%), Biology with a mention in Biotechnology (6.1%), Engineering Environmental (14.4%), Agricultural Engineering (12.6%).

Descriptive Analysis: Environmental Concern: Of the 5 items with negative attitudes, 8 with positive attitudes, of the Environmental Concern Scale, distributed in four dimensions that evaluate the attitudes of the students, obtaining a range of 13 - 65 and a potential average of 44.02, is located in the medium degree of environmental concern.

Note: (-) Unfavorable attitude ( +) Favorable attitude

If we analyze the results by Career or Professional School, it is obtained that Environmental Engineering has positive results and is explained by its professional profile, according to the dimensions considered in the research, while Schools with little or no training in environmental matters have low potential averages.

In relation to Environmental Training: In the opinion of the students surveyed at the José Faustino Sánchez Carrión National University, for 65.47% it is Regular, 19.06% consider it Good and 15.47% have not had any training in environmental matters, specifically environmental training is being valued in The theoretical content, the highest percentage consider that in the courses they have taken, they partially encourage the rescue of values, national identity, and content with environmental themes.

Regarding the Curriculum Plan, based on the documentary information, the schools have courses with content on environmental issues as part of their curricular plan from more to less: Environmental Engineering, Agronomic Engineering, Biology with a mention in Biotechnology, and Zootechnical Engineering; and the schools that do not have courses with environmental themes are: Electronic Engineering, Chemical Engineering, Statistics and Computer Science, Economics and Finance; Coinciding with what is obtained by (Venegas & Quijano, 2017) those who conclude Administration and accounting, they do not contain subjects related to the environment, meanwhile in the Nursing school their thematic contents are related to the humanistic aspect.
Regarding the Quality of Environmental Training received, the students who have a favorable Opinion are those from the School of Environmental Engineering; for those of Zootechnical Engineering, Nursing, Biology with a mention in Biotechnology, Statistics and Computer Science, they consider that the training will allow them to know, understand, face and act on environmental issues in more than 50% of the cases. Where there is some negativity in this aspect, it is in the students of Sociology, Economics and Finance (larger number) and Chemical Engineering in a lower percentage.

In relation to the teaching methodology referring to environmental issues: The students of Environmental Engineering, Agronomic Engineering, Zootechnical Engineering and Biology with a mention in Biotechnology, consider that teachers have developed environmental issues in greater proportion within the contents and methodology; in Economics and Finance, consider that teachers do not develop anything related to environmental issues as part of the methodology of the courses, a result that coincides with what was obtained by (Padilla, 2016), who in his research found that the training of teachers is still incipient, which that contrasts with the student attitude that is positive.

**Correlational analysis:** To determine if the degree of environmental concern is related to the environmental training of the students of the Institution, in the exploratory data analysis, to determine if the sample fits a normal distribution, we use Kolgomorov - Smirnov ( lilliefors significance correction ), is obtained for environmental formation with a value of 0.070 and p=0.002<0.05, rejecting the null hypothesis, concluding that there is no normality in the data; and for the environmental concern variable with a value of 0.062 and p=0.011<0.05, it is concluded that the data are not normal. Considering that they are ordinal and non-parametric data in both variables, we use the Spearman's rho correlation coefficient, and for r = 0.081 with p=0.179>0.05, it is concluded that there is no significant correlation between the variables.

When asked: If the level of environmental training that you are receiving from the University correlates with the extent that students consider the importance of the environment, r=0.109 and p=0.071>0.05 are obtained, which indicates that despite the fact that it is necessary to have professional training in environmental issues as a basis, to know, interpret, and promote actions in favor of the environment, this does not imply that the importance of the environment is not considered and valued (62.59%) , and similarly for each school.

• In relation to the correlation of the dimensions of environmental concern:

Non-personal control over the environment is significantly correlated with the personal effort that the student is willing to make for the conservation of the environment (r=0.135*, p=0.025<0.05); At the same time, it correlates significantly with the irresponsible attitude towards pollution, directly (r=.435** p=.000<0.01 ) ( both negative attitudes).

It is also observed that the student is aware that he has to be an active part to stop pollution and seek environmental protection, which is statistically demonstrated (r=.571**; p=.0000<0.01) that there is a high
correlation of the personal effort for the conservation of the environment and to achieve the prevention and control of contamination, with a direct and positive relationship.

It is obtained that there is a significant correlation between the prevention and control of pollution with an irresponsible attitude towards pollution \((r=-.350; p=.000<0.01)\), whose relationship is indirect, that is to say that while the irresponsible attitude decreases, the search for pollution prevention and control will increase.

- In relation to the correlation of the dimensions of Environmental Training:

  Regarding the humanistic and pro-environmentalist training in the contents of the courses, it correlates directly and positively with the number of courses in the curricular plan \((r=, 415, p=.000<.01)\), which implies that the greater the number of courses with environmental themes, the greater the humanistic training; and at the same time, it correlates significantly with the quality of environmental training \((r=.302; p=.000<.01)\), and with the methodology used by the teacher in the development of content \((r=.411**; p=.000<.01)\).

  The number of courses that are part of the environmental curriculum is significantly correlated \((r=.547**; p=.000<.01)\) with the quality of training in environmental issues, and with the teaching methodology (with a curricular plan with more courses related to environmental issues \((r=, 632**, p=.000<.01)\), and for its part, the quality of university education is significantly correlated with the methodology used by the teacher in the matter. environmental \((r=. 507**, p=.000<.01)\).

- Correlation between the dimensions of environmental concern and dimensions of environmental training:

  A high significant correlation is observed between humanistic and pro-environmental training in the contents of the courses, with non-personal control over the environment, directly and positively \((r=.192; p=.001<0.01)\), and with the methodology that the teacher uses in the classroom in environmental matters \((r=.150; p=.012<.05)\); which implies that while training in ethical values, critical analysis of reality is encouraged, and methodologies that include the environmental dimension in their teaching with practical examples are used by the teacher, students will have a greater incentive to actively participate with sense of responsibility and adopt positions that lead to pollution control and environmental conservation.

  The quality of university education on environmental issues is correlated with the personal effort that the student manifests, is willing to make for the conservation of the environment \((r=.131; p=.030<0.05)\), with adopting actions and actively participate in the prevention and control of pollution \((r=.231; p=.000<.01)\).

  In relation to the correlation of the level of environmental training, with the degree of environmental concern of the students by professional school, there is a significant correlation at a significance level of 0.05 in the School of Environmental Engineering \((r=.375*; p =.017<0.05)\), between the level of Environmental Concern and their training in environmental matters, with a positive relationship and there is a correlation at a significance level of 0.01 in the School of Sociology for \((r=.549* *; p=.005<0.01)\).
between both variables, while in the remaining schools, there is no statistically significant correlation between both variables (p>0.05).

Berenguer and Corraliza (2000) mention that "when concern for the environment is evaluated at a general level, high levels of environmental concern are recorded, however, this evaluation is not sufficient to predict other pro-environmental beliefs and values", in this investigation asked the students to self-assess and respond to the importance they give to the environment, and it was obtained that for 62.59% the environment is very important to them, and through the evaluation of the scale of environmental concern (EPA) has a potential average score of 44.02 points out of a maximum of 65, which corresponds to a medium degree of environmental concern (61.5%) with students who have a high degree of concern (35.97%).

"Environmental concern has been considered a descriptive parameter of the level of environmental awareness, and a predictive variable of environmental behavior" (Berenguer & Corraliza, 2000), under this premise it was observed that the highest percentage of students know the existence of pollution in lakes, rivers, air, but they consider that nature through the purification processes will return it to normality (non-personal control over the environment), however they are willing to make personal sacrifices, whether economic, time, or other activities to prevent the extinction of animals and reduce the rate of pollution (personal effort for the conservation of the environment); as part of the pollution prevention and control actions, as well as requiring government agencies to participate directly in pollution control, but they also consider that secondary schools should be the first to provide education on the conservation of natural resources, this statement is related to what Amérgio and García, (2014) express: "people value their concern for environmental problems depending on whether these have harmful consequences for oneself, other human beings or the biosphere ".

The highest percentage of students surveyed considered that the training in environmental matters received is Regular and agrees with the analysis of the indicators proposed by Cárdenas (2014); who considers that the incorporation of the environmental perspective in the training function of universities is moderate to low.

The pro-environmentalist attitudes on the part of the students are influenced by their professional profile, such as the School of Environmental Engineering, whose training is correlated with the degree of environmental concern, unlike the other schools analyzed in this research, which agrees with (Casas & Jaula, 2004)that considers that the university, from its traditional treatment, is responsible for the fragmentation of the fields of knowledge and for a large part of the negative effects that this has caused on the natural and social environment; but it is also noteworthy that the School of Sociology despite not having an "environmentalized " professional profile, there is a correlation in both variables, which explains that positive attitudes in relation to the environment, is not only conditioned to the academic training or formal education, if not based on the environment, culture and customs that are innate in the human being, as mentioned (Delgado, 2012)that informal education refers to the various learning achieved through daily
experiences at home, work, street, trips, etc., when talking, reading or using mass media and the author considers that the baggage of information, skills and attitudes that people possess is due to it.

**4 CONCLUSION OR FINAL CONSIDERATIONS**

Pro-environmentalist attitudes such as environmental concern in university students are not only influenced by their formal education or professional training, but also depend on the various learning they acquire from their daily life activities and the cultural and social environment.

Assume the environmental policy as an institutional policy in an integral manner, which will allow students and future professionals to identify environmental problems that cause a decrease in the quality of life, will have an interdisciplinary approach and will be active actors in the performance of their work and professional activities in for sustainability.

It is important to generate a teacher training and updating plan as an academic policy, with an interdisciplinary approach, with collaborative work that allows adopting and internalizing the environmental culture, improving collective and environmentally responsible performance at the University.

This research was carried out with the participation of Dr. Cristian Iván Escura Estrada, who departed to infinity, a tribute to his memory.

ABSTRACT

The present work aims to analyze land tenure regularization and its effects on realization of the social function of the city, through the foundations established by the City Statute. Seeks to demonstrate the multidimensional interest in the implementation of land regularization, from the perspective of protecting the interests of the collectivity and the paradigm of Democratic state. To do so, the following research problem was started: Is land regularization an instrument for realizing the social function of the city?

As research methodology, the inductive method was used and, in the data processing phase, the Cartesian method. In the different phases of the research, the techniques of the referent, gives category, concept operational and gives search bibliographic.

Keywords: Regularization Land Holding, Occupation Social Gives City, Right The City Sustainable, Straight To Home, City Statute.

1 INTRODUCTION

O right The home, While right Social, it is focused at the foundation constitutional principle of the dignity of the human person, constituting an intrinsic bond to the individual as a member of society, in order to provide dignified conditions capable of carrying out the enjoyment in Your rights.

From this perspective, the right to a sustainable city stands out, which from the new constitutional order of 1988, became an asset worthy of special legal protection. O constituent recognized the importance of granting specific legal treatment and suitable for habitat protection in which the majority of the Brazilian population lives, as condition for The quality in worthy life.

However, the migration from the countryside to the urban environment reflected in a growth vertiginous population of cities, generating serious impacts on their structure due to the absence of support and receptivity to this great population demand. This lack of adequacy urban It is O result of scenery current, compound for the inequality Social, absence in infrastructure basic, materializing in subnormal clusters.  

---

5 According to IBGE (2010) It is a set consisting of at least 51 housing units (shacks, houses, etc.) lacking, most of them essential public services, occupying or having occupied, until recently, land owned by others (public or private) and being arranged, in general, in a disorderly and/or dense.
In wake up with O Census Demographic of IBGE accomplished in 2010, were 15,868 census sectors were identified nationally in subnormal clusters. THE From these data, the search for relief escape for the subjects of this critical reality, which aims not only the simple titration, but also the application From rights correlated what if establish per intermediate gives relationship in interdependence in between The occupation property social and The occupation social of City.

In that context, The search sought to analyze The problematic established in between The relation of subnormal agglomerates and the deficiency in the implementation of basic rights inherent to the social function gives City.

From this approach, the following general objective is to analyze the regularization land ownership and its effects on the realization of the social function of the city, through the paradigms established by the City Statute. The scope, therefore, is to demonstrate the aspect multidimensional form of title regularization in the protection of collective interests, through gives urban structural relationship of the individual and the safety yours dwelling place.

Such premises they are established fur Statute gives City, what bestowed The competence gives structure and organization From counties for plans directors own, governing each which with your particularities, for O The end in promote you goals constitutional and materialize a state of Right governed by dignity gives human person.

In order to carry out this study, in the investigation phase, the method inductive, which, in the words of Pasold (2018, p. 95) means “research and identify the parts of a phenomenon and collect them in order to have a general perception or conclusion”. At data processing phase the Cartesian method 6, and the report of the results expressed in the gift Chapter is composed in base logic inductive.

In the various phases gives search, were triggered at techniques of referent 7, gives category 8, of concept operational 9, gives search bibliographic 10, with O scope insubstantiate one general conclusion about the theme studied.

2 O STATUTE GIVES CITY AND THE INSTRUMENTALITY OF PLANNING URBAN PLANNING

The social migratory movement from rural to urban areas was one of the main causes for inefficiency of greeting gives occupation Social gives City. THE absence in receptivity so much in scope structural, how much economic destined The population migratory

---

6 On the four rules of the Cartesian Method (evidence, divide, order and evaluate) see Leite (2001, pp. 22-26).
7 “[... the prior explanation of the reason(s), the objective(s) and the desired product, delimiting the scope thematic and approach to intellectual activity, especially for research. .” (PASOLD, 2018, P. 62).
8 “[... a strategic word or expression to the elaboration and/or expression of an idea .” (PASOLD, 2018, P.31).
9 “[... a definition for a word or expression, with the desire that such definition be accepted by the effects of ideas that we expose [...]”. (PASOLD, 2018, P. 43).
10 “Technique in investigation in books, repertoires jurisprudential and collections cool.” (PASOLD, 2018, P.217).
there is measurements in invasion and buildings informal in housing, solidifying you clusters subnormal.

According to IBGE data (2010), subnormal clusters are defined fur Following concept:

"Illegal occupation of land, that is, construction or on land owned by others (public or private) at the present time or in a recent period (obtaining the title ownership of the land for ten years or less); and b) Possess at least one of the following characteristics: • urbanization outside the current standards - reflected by roads in circulation narrow and in alignment irregular, lots in sizes and shapes unequal and constructions not regularized by public bodies; or • precariousness of services public essential, such which energy electric, collect in trash and networks inWater and sewage.

Marked by clusters, cities reflect a regime of social discrepancy, depriving basic rights, with strong repercussions on the dignity of the human person. Such facts demonstrate the setback of urban development in which society lives, in especially in theme home.

In the words in mukai (2007, P. 69) The absence in planning urban planning accentuated the housing problem because the “[...] absence of Urban Policy, which gave margin to a disorderly growth of large cities in Brazil and, therefore, exacerbated old problems of Brazilian cities, problems that go back to the colonial.

With this critical scenario consolidated, the City Statute seeks an escape from assistance, bringing planning and organizational policies, with the aim of reversing this chaos that was established, attributing mainly to the Municipalities the responsibility of the development and structure of the urban environment.

So being, O Statute gives City he was edited for regulate you articles 182 and 183 of the Constitution of the Federative Republic of Brazil of 1988. Its objective is to establish rules of public order and social interest to regulate the use of urban property for the benefit of of well collective, gives safety and of welfare From citizens, well as of balance environmental.

You assumption consolidated at the Statute gives City establish, therefore, in line with the fundamentals guided by the branch of the Federal Constitution of 1988, which transcends the prediction of fundamental principles and objectives and aims at the implementation of measurements effective with Software socially fit The to meet you yearnings of societies contemporary (CARDOSO, 2021, P. 63).

According to Canuto (2008, p. 109), the City Statute has the scope in get:

[…] the fullness of public policies aimed at the citizen and, in this objective, to integrate transport, housing, planning urban, quite environment, health, education, sanitation basic, assets historical and architectural, all worked with management democratic.

These public policies will be carried out through plans directors what represent, under The aegis constitutional, The autonomy urban transferred for each County for The creation and development of measurements materialized themselves in this plan.
halls (et in, 2014, e.g. 84) indicates what:

 [...] The policy specific in development urban play to Government Municipal, what he must promote O your implement excelling fur exactly attendance at needs and requirements of collective well-being. The “social function” to be converted as a rule positive by the master plan came in charge of establishing the standards of growth, ordering the reorganization of cities in attention to the peculiarities and needs locations.

In that sense, set in discussion The municipalization gives responsibility in execution of the urban order, because, with the advent of the City Statute, the master plan is the main instrument achiever gives occupation Social gives City, staying The office From Counties its development, as highlights Nunes (2013):

Bringing new empowerment of Brazilian municipalities, which will henceforth be the executors and implementers of policies urban, the Letter Magna in 1988 observed the principles of the social function of property, the dignity of the person human development, the social function of cities, among others, as structuring elements urban policy in the country, leaving the Union responsible for setting the guidelines general guidelines, which will serve as parameters for the municipalities. To these, however, competes the biggest challenge of all: the practical application and achievement of objectives settled down and sought after for at cities.

The charge evaluative what O plan director check to the Counties demonstrates The importance of the prior diagnosis of social aspirations, which are not only of a immediate, but also of a future order, aiming for the future and growth of the environment urban. Therefore, the elaboration of these plans “[...] must necessarily count with The participation gives population and in associations representative From several segment economic and social, not only during the drafting and voting process, but, above all, at Implementation and decision management there defined” (SANTIN, 2013, p. 200).

It is on this bridge of connection between the growth of the city and the well-being of the citizens that if evidence The goal of Statute gives City and your guidelines, at which ensure that one relationship of interdependence of the aforementioned rights, seeking to implement a policy democratic planning, from the communication relationship between what it is necessary for the execution of right gives collectivity and the guidelines of planning urban municipal.

3 THE REGULARIZATION LANDOWNER AND THE RELATIONSHIP MULTIDIMENSIONAL IN THEIR REFLEXES

One of the main tools to guarantee the protection of the right to housing, which by virtue of constitutional amendment n° 26/2000, it introduced the right, in the role of social protection. land tenure regularization, provided for in the City Statute, with the aim of guaranteeing gives protection of holder of immobile, as well as the effects and rights from that degree.

Through the City Statute, the competence of urban planning of cities, was conferred on the municipal power, which was delegated by the Federal Constitution (1988), with prediction in article 182. Here is the content of the article 182:
At provisions contained at the mentioned article “[…] guarantee to citizen no not only the right to a balanced environment, but also the means for its maintenance, housing, conditions suitable in job, recreation, circulation human and O full development in all its functions” (MATIAS, 2006, p. 32).

For the realization of these guarantees, the City Statute brought several guidelines, being a From main instruments The regularization land, The which Visa to guarantee The titration in real estate peacefully busy who don't enjoy of rights real of housing.

Consequently, land tenure regularization aims to make the transition from possession for the real right of property, realizing the right to housing, in order to remove the protection of informality and guarantee the occupants a new destination based on the construction of guarantees urban planning.

Law 13.465/2017 brought the context about the concept of regularization land:

Art. 9th stay instituted at the territory national standards general and procedures applicable The regularization landowner urban (Reurb), The which covers measurements legal, urban, environmental and social issues aimed at the incorporation of the nuclei urban informal to land use planning urban and The degree of their occupants.

One should think about the land regularization instrument from an multidimensional, as its effects transcend the essentially legal context, impacting on the social, economic and environmental policies of the regularized environment. He meets, therefore, the novel of metropolitan problems, acting as a conductor of transposition of theirirregular occupation space for urban territorial planning (LEITE, 2020, p. 210- 211).

There is, therefore, The articulation in several contexts urban planning under O aspect constitutional, in manner what O scope normative It is what The repercussion Social be notably amplified for in addition gives concession of title in property, aiming transmuting the marginalized aspect of informality, in order to insert O guy in the novel in rights that belong to them (OLIVEIRA; NUÑEZ, 2014, p.85).

Thus, its implementation does not only concern tabular regularization, that is, of property rights, but includes a set of measures to be implemented indifferent perspectives, seeking to achieve the function of property to the individual, for the purpose of materialize The occupation Social gives City. looking for O focus individual, without neglect The repercussion collective action inherent to social relations.

About addition, honey (2011, p.15) teaches what:

Grant only a title or registration to these residents, without guaranteeing a level adequate housing, basic infrastructure such as water, sewage, electricity and even free spaces for leisure and social activities, is to violate the constant basic principle of the first article of the constitutional text as the foundation of the Republic which is the dignity of human person.
It is through these premises that regularization transcends titration and goes to the meeting of the social function of the city that establishes a relational character between society and the power public, demonstrating the nature diffuse and interdisciplinary gives regularization landowner.

In this diffuse character, the individual interest of the owner of the Earth, with remarkable contribution at the foundation democratic ruled at dignity gives person human rights, which are the use, enjoyment, of the dwelling where the possession has already been established, as well as establishes the path of the social function of the city that reaches the well-being of the community, and, therefore, densify the ball in performance of the public power.

That Link in interests goes back to the ideal in City sustainable, waved per Canute (2008 p. 111):

> O right at cities sustainable if frame at category From rights diffuse and your Realization complies O objective intended with O development urban: to take at fairer, more humane and democratic Brazilian cities, with conditions worthy of life, for the exercise of civil and political, economic, social, cultural and environmental and, in that sense to guarantee O right The Earth urban, The home, to sanitation, The infrastructure urban, to transport and to the services public, to work and to leisure.

Thus, this diffuse relationship depends on a dualistic effort, that is, on society and power public, you which must to establish one relationship in cooperation in interests, in way to build the bridge between the effects of land regularization and the realization of the right constitutional The City.

At the same time, “land regularization is a legitimate aspiration of the residents who were compelled The to occupy or purchase land in this situation. That When if treat, obviously, in residents without option [...]”. (NALINI, 2011, p. 164)

Of that mode, it is noticed what you effects gives regularization surpass The your nomenclature, removing from the public power, especially from the cities, the inertia of the application of public policies in the regularized region, entrusting effective urban reintegration measures for the good be the middle one collective.

### 4 YOU EFFECTS GIVES LAND REGULARIZATION AT REALIZATION OF OCCUPATION SOCIAL GIVES CITY

O model in urbanization current he comes demonstrating The need in larger Warning government in housing policies, making land tenure regularization an instrument indispensable for O greeting gives occupation Social gives City, per quite of model constitutional in sustainability.

In that sense, Oliveira (2009, p.26) you see what:

> [...] for O reach gives sustainability gives City, It is essential O respect and, mainly, The effectiveness of principle fundamental gives dignity gives person human rights, to be realized through the right to urban land, housing, sanitation environmental, The infrastructure urban, to transport, to the services public, to joband to leisure.
The perspective of dignity under the aspect of sustainability of cities, consists of the basic rights that the public power must provide to the citizen. Sarlet (2012 p. 73) teaches that the dignity gives human person represents:

[...] the intrinsic and distinctive quality recognized in every human being who makes it deserving of the same respect and consideration on the part of the State and the community, implying, in this sense, a complex of fundamental rights and duties that ensure the person so much against all and any act in imprint degrading and inhuman, as will guarantee the minimum existential conditions for a healthy life, in addition to providing and promoting their active and co-responsible participation in the destinies of one's own existence and life in communion with other beings humans, through O due respect to the too much beings that integrate the network gives life.

The presupposition of dignity cannot be measured, or stagnated, on the contrary, O public power must every day seek public policies that come to idealize the model of inclusive society and guarantor of fundamental rights as a source of its responsibility in guardianship of social interests.

Kant (2007, P. 64) contributes with The theme, stating what The dignity It is "O what if makes a condition for something that is an end in itself, it simply has no value relative or price, more a value internal, and that means dignity”.

In the present study, the axiological load of dignity is first observed by the housing bias, given the security it provides to the land owner, especially because of the bond what guard with the social environment.

IT IS The leave of this focus what The regularization landowner if substance as regulatory instrument of a series of intertwined rights, having as basic foundation the promotion of physical, social and psychological security for the citizen. The focus of its implementation contemplates the improvement of the quality of life that goes beyond public policies and covers the entire the structure of the city's social function, from the conception of projects to the effective performance of the power public and of the individual.

Of that mode, O scope of policies in regularization land, It is promote The sustainability space. According to Mendes (2009):

Spatial sustainability encompasses the organization of space and meets criteria overlapping territorial occupation and intertwined in an enduring natural network for try to recover, with it is complex and diversified plot, The quality in life, The biodiversity and The scale human in each fragment, in each neighborhood of system.

The sustainability bias under the title regularization approach is preached by through a broad concept, freeing itself from the chains of the narrow sense and transcending for the realization in the social environment, linked to the social function of the city, both for the individual at the property aspect, how much for the City, at the general context housing:

[...] no enough think The question gives regularization just from Score in View From individual rights of residents of informal settlements, that is, security individual ownership: it is necessary
to think about how these programs, combining strategies urban planning and democratic management processes-can also guarantee socio-spatial interaction. (FENANDES, apud MUKAI 2007, P. 29)

In the meantime, it is interpreted that the effective center of the individual's social relations, presents itself strictly in cities, from a social context, which is based on the responsibility of power public in dispose to the citizens in means basics in life Social, for how much "O right The City transcends The freedom individual in to have access to the resources urban" (BODNAR, ALBINO, 2020, p. 114).

To the realization gives occupation Social gives City, therefore, it is necessary to analyze primarily the social function of property, because it is through this relationship of interdependence biphasic what if from the The realization of urban constitutional guarantees.

In analyzing the social function of property, the individual character stands out, seeking in this, The safety physical, territorial, externalized The leave in one integration Social in public and legal knowledge of the dwelling belonging exclusively to that owner (ALVARENGA, 2011, p.7).

The social function of property requires some basic urban modification points, then The simple titration no complies with The your occupation primordial, It is required what if dispense underlying changes to this apparent phatic model.

Second Alvarenga (2011, p.7):

[... ] the social function of urban property takes place through the correct use of the urban space, under the terms of the Municipal Master Plan. She should be concerned about rationality gives occupation of ground, organizing and rearranging at cities, indicating the places equipped with infrastructure and urban equipment that can be occupied, as well as the places that do not support densification, as in the risk areas and watershed protection. It is the search for the best organization of the urban space, significantly contributing to the population's quality of life and for the socialization gives property.

It is from this relationship of interdependence of affirmative actions that the social function of the city, concretized from subsequent acts carried out internally in the citizen's housing, to the external environment through the obligation of improvement in the quality of public services essential to life in society.

In the words in Matthias (2006, p.32) The occupation Social gives City:

[... ] guarantee not to the citizen only right to a balanced environment, but also means for your maintenance, housing, conditions suitable in work, recreation, human circulation and the full development of all its functions. Such responsibility It is relegated to County, what shall enable Oattendance to needs basics of your population.
It is concluded, then, that the city only fulfills its social function when it ensures a guarantor approach between the social function of property and the city, aimed at the realization of the dignity of the human person, starting from the instrumentalization of land tenure regularization of this relational focus of reciprocity between the interest of the collectivity and the municipal power for the safeguard in basic urban rights.

5 CONSIDERATIONS FINALS

THE reality chaotic gives urbanization Brazilian demonstrates you reflexes gives lack inplanning structural, The which has violated rights foundational From beings humans in society, restricting an important nuclear scope of protection with regard to the social right to home.

IT IS in this interim what comes up The importance in policies public in housing, inSpecial The regularization land, by having as responsibility effect O right in property, no only as a simple act in concession in titration in home, because its scope goes beyond the formal and objective regularity to fulfill and carry out the dimensions in rights correlated with the social function of the City.

Thus, the implementation of public policies for land tenure regularization aims to make effective the right to the city from the perspective of the dignity of the human person, especially in the search for protection of the individual and the realization of their rights before society, especially why search instrumentalize O right The home and you rights fundamental related, democratizing the access to the right to City.

Therefore, The realization gives occupation Social gives City It consists at relationship gives effective materialization of the social function of property, channeled from the perspective of the right of owner of the land, who, after obtaining the title to the property, acquires formal protection. It is protection, therefore, meets individual desires and their correlation with the social environment, allocating the individual to the formal urban planning and granting him security from a reading constitutional of worthy life.

ABSTRACT
Introduction: Delirium is a transient neuropsychiatric syndrome considered a geriatric emergency, related to prolonged periods of hospitalization and which contributes to an increase in the mortality rate, especially in the elderly affected by SARS-CoV-2. Objective: To carry out an integrative review of the literature in order to list factors of importance of screening, anamnesis and physical examination to contain the early manifestation of delirium in elderly patients affected by Covid-19. Methodology: This is an integrative literature review carried out by searching for scientific articles in Pubmed (NCBI), Latin American and Caribbean Health Sciences (Lilacs) and Scientific Electronic Library Online (SciELO) databases. For this, the descriptors were used: Coronavirus, Delirium, Elderly and the filter “PUBLICATION DATE” was selected with the option “5 YEARS”, in the aforementioned databases. The articles selected through the PICO strategy were submitted to methodological rigor and level of evidence analysis. Results: 155 scientific articles were found; however, 17 articles were selected after analyzing the inclusion and exclusion criteria. Of this sample, 41, 17% of the selected studies reported that delirium is associated with high mortality and morbidity, in addition to being often underreported. Screening using tools such as the Chart-Based Delirium Identification Instrument is essential for early detection of delirium. Conclusion: Multiprofessional team work aligned with medical work is necessary for early intervention of delirium in elderly patients with Covid-19.

Keywords: Coronavirus, Delirium, Elderly.

1 INTRODUCTION

Delirium, also known as acute confusional state, is a transient neuropsychiatric syndrome. It is called deficiencies in several aspects, such as attention, consciousness and cognitive function. Most presentations are preceded by nonspecific signs and symptoms, characterized by restlessness, anxiety, irritability and sleep disturbances (Maldonado, 2017).

Because it is the most prevalent acute confusional cognitive disorder in the elderly, an epidemiological and pathophysiological study is needed to reduce the risk of complications in these patients. The highest prevalence of delirium occurs in men who are approximately 65 years of age or older and have triggering factors for the development of delirium (Moraes-Júnior et al., 2019).

Among the triggering factors of delirium, we highlight associations with infections, water electrolysis disorders, some drugs such as antiallergic and sedatives, and cardiovascular and endocrine system diseases are also common (Moraes-Júnior et al., 2019). Emmerton and Abdelhafiz (2020) relate the
occurrence of delirium to the presence of comorbidities, multisystem dysregulation, diseases of the neurological system and the environment in which the patient lives.

Delirium is considered a geriatric emergency and is related to prolonged periods of hospitalization, in which mortality rates are higher. The diagnosis is made through anamnesis and physical assessment of the patient, and therefore knowing their clinical characteristics and performing a detailed physical examination is crucial for assertiveness in the analysis (Unicovsky; Santarem, 2020).

From the emergence of the infection caused by SARS-CoV-2, called by the World Health Organization (WHO) of Covid-19, in December 2019, in the city of Wuhan, China, it was observed that patients infected by this disease had severe respiratory symptoms, consistent with a respiratory distress syndrome (SAR), as well as the effects on the incidence of delirium in hospitalized patients, showing that delirium can be triggered by isolated factors and that SARS-CoV-2 infection can be an important trigger (Bosco et al., 2020).

There is a high incidence of elderly people who have preexisting comorbidities, making them more fragile, increasing the risk of worsening the patient with Covid-19 and, consequently, prolonged hospitalization, which presupposes a worse prognosis for the patient. Based on this information, it is important to research and establish delirium screening in patients with Covid-19, in order to reduce the risk of this clinical condition and facilitate early intervention and improve future outcomes (Emmerton; Abdelhafiz, 2020). Thus, it is essential to understand the relationship between Covid-19 and delirium, especially in the elderly population, in order to minimize the effects arising from this relationship. In this context, the objective was to carry out an integrative review of the literature, in order to relate the importance of screening in elderly patients who were affected by Covid-19, who needed prolonged hospitalization, and its evolution with the early occurrence of delirium.

2 METHODOLOGY

This is a descriptive-exploratory research with the objective of investigating, through screening, the potential for delirium manifestation in the elderly, who needed prolonged hospitalization due to Covid-19, allowing the construction of an integrative literature review, following the model described by Soares et al. (2006). Bibliographic searches were carried out in the virtual databases: Pubmed (NCBI), Latin American and Caribbean Literature on Health Sciences (Lilacs) and the Scientific Electronic Library Online (SciELO) from April 7 to June 28, 2022 For this, the descriptors were used: Coronavirus, Delirium, Elderly, joining them through the Boolean operator “AND”.

The scientific question that guided the search strategy of the present study was developed by the authors and followed the guidelines of the PICO strategy, being: What is the importance of screening for delirium in elderly patients who had Covid-19 and required hospitalization? With the inclusion criteria, full scientific articles available online were adopted that contained the descriptors in the title or abstract,
written in Portuguese, Spanish and English, using the filter “PUBLICATION DATE” and selecting the option “5 YEARS”, in the aforementioned databases.

Works that did not meet the central theme and duplicated works were also excluded. In addition, the articles included in this study were evaluated for methodological rigor, using an instrument adapted from the *Critical Appraisal Skills Program* (CASP), of the *Public Health Resource Unit* (PHRU, 2006). This adapted tool (Chart 2) presents 10 items (maximum 10 points) and classifies the works according to this score: 6 to 10 points, good methodological quality and reduced bias; 5 points or less, satisfactory methodological quality with increased risk of bias. In the selected studies, a second instrument from the US *Agency for Healthcare and Research and Quality* (AHRQ) was also applied. This, in turn, according to Stillwell et al. (2010) presents the hierarchical classification according to seven levels of evidence according to the research design.

3 RESULTS

Based on the search strategy used, 154 scientific articles were obtained, all from the Pubmed database.

After the first analysis, 31 primary articles (20.1%) were selected for full reading. Subsequently, the articles underwent a final analysis, regarding the adequacy to the theme of the review and exclusion of duplicates, which resulted in the final selection of 17 articles ((11%) (Figure 1).

The selected works were analyzed allowing to extract from each of the works their main results and conclusions obtained that allowed answering the question of this review. Finally, the articles were numbered from N1 to N17, in order to include the essential information of each work, such as: title, year, author, type of study and results (Table 1).

The evaluation of methodological rigor resulted in 11 works (64.70%) that presented good methodological quality and reduced bias, which scored ([Figure 2](#) - circles in green). On the other hand, 3 studies showed good quality and low bias ([Figure 2](#) - gray circles) and only 2 studies (11.76%) showed satisfactory methodological quality with increased potential for bias ([Figure 2](#) - red circles).

**Figure 2** – Analysis of methodological rigor and risk of bias of the 17 articles analyzed.

Source: Authors, 2022.
Regarding the levels of evidence, it was found that 12 studies (70.58%) had level of evidence IV (N2, N3, N4, N5, N6, N7, N8, N10, N12, N13, N16 and N17), 2 (11.76%) had evidence level VI (N1 and N9), another 2 (11.76%) had evidence level V (N11 and N14) and 1 study (5.88%) had evidence level I (N15).

4 DISCUSSION

Delirium can be characterized as a clinical syndrome that can cause acute impairment of cognition and attention, it can also lead to hallucinations and behavioral disorders. This clinical picture can be triggered by a general medical condition, environmental factors or the use of some medication (Ito; Pedri, 2013). In addition, its development can start in a short period of time, for example, in hours or days, which makes it different from the symptoms of dementia and other cognitive disorders; it may be reversible because it is an organic cause and fluctuates throughout the day (Ito; Pedri, 2013).

After analyzing the results (Table 1), it is confirmed that the following are non-modifiable risk factors for delirium: male gender, being elderly, the total number of medications in use and use of antipsychotics, in addition to having dementia and/or disability auditory, visual and functional. It may also be associated with poor clinical outcomes, including prolonged hospital stay, admission to long-stay institutions, need for intensive care, use of mechanical ventilation, and loss of independence (García-Grimshaw et al., 2020; Mcloughlin et al., 2020; Mattace-Raso et al., 2020; Duggan; Van; Ely, 2021; Martinotti et al. 2021).

The elderly have delirium as the sixth most common symptom in Covid-19, and the prevalence was higher in hospitalized patients, however, they are not always diagnosed, suggesting a clinical complication and sequelae that affect the quality of life of these people and may even even favor death, making delirium an important risk marker for identifying a poor prognosis (Marrengoni et al, 2020; Mcloughlin et al., 2020; Kennedy et al., 2020).

Studies confirm that severe acute coronavirus syndrome may be responsible for neurological diseases, due to a direct effect of viral invasion in the central nervous system, to inflammatory mediators induced by the infection, to factors of the disease and of the treatment for Covid-19 itself. Because of this, patients may have altered consciousness and cognition disorders (Benussi et al., 2020; Helms et al., 2019; Hariyanto et al., 2021; Shao et al., 2021; Lahue et al., 2022).

There are several types of delirium in elderly people hospitalized with Covid-19, the most prevalent being the hypoactive condition, followed by the hyperactive and mixed. Patients with cognitive impairment were more likely to develop delirium compared to those who were cognitively normal before contracting the disease. Another observation made through the studies is that most cases of delirium occurred on the first day of hospitalization, which proves and emphasizes the importance of comprehensive care from the onset of the first symptoms (Forget et al ., 2021; Mendes et al., 2021).
According to the study by Sharon and Inouye (2021), contributors to the development of delirium in Covid-19 are the cytokine storm and immune dysregulation that trigger neuroinflammation (in the brain and meninges) and hypercoagulability. In addition, they state that there are other precipitating factors such as various medications with psychoactive effects, mechanical ventilation, ICU stay, immobility, malnutrition, sleep disruption, social isolation and emotional stress. Therefore, even during the Covid-19 pandemic, delirium can be associated with several reversible factors.

Koftis et al. (2020), state that in addition to the causes mentioned above for the development of delirium, they recognize that it can be a manifestation of direct invasion of the central nervous system (CNS) or induction of inflammatory mediators of the CNS. In addition, he understands that it may be a secondary effect of the failure of other organs, an effect of the strategies used for sedation or environmental factors, which include social isolation. Based on experience carried out in the study, it is also believed to be associated with seizures, impaired consciousness, or signs of increased intracranial pressure.

Based on this information, approaches are suggested for the prevention and management of delirium during Covid-19 that can be incorporated into your routine, especially in hospitals. Among them, we can mention: providing communication boards, guidance sheets, remote visits, providing therapeutic activities, encouraging mobility and exercise in the isolation environment, carrying out medication review and educating the team about adverse effects in the elderly, among others. others (Sharon; Inouye, 2021).

According to Leslie et al . (2008), the development of delirium is often associated with functional decline, increased morbidity, increased length of hospital stay, and increased mortality. According to this information, 41.17% (N2, N5, N6, N7, N11, N13 and N15) of the articles analyzed in this study confirm that delirium is associated with high mortality and morbidity and is often not diagnosed.

One of the ways to perform screening for delirium are the Delirium Observation Screening Scale (DOSS) methods, the 4-AT tool, the Chart-Based Delirium Identification Instrument and the Diagnostic and Statistical Manual of Mental Disorders 4 and 5. However, other methods and signs and symptoms should not be ignored, such as delirium and the absence of typical symptoms of Covid-19 (cough, fever and shortness of breath) . Through early detection, infection and death control in this vulnerable category of patients is facilitated, making care delivery as appropriate as possible (Alkeridy et al., 2020; Hariyanto et al., 2021; Mattace- Raso et al., 2020; Pranata et al., 2021; Zazzara et al., 2021).

Furthermore, Neto et al. (2021) mentions that long-stay institutions for the elderly, in addition to collective environments, have individuals who may be vulnerable to infection by the new coronavirus. The author also mentions that elderly people with delirium, for example, may suffer from the effect of social isolation and confuse this situation with the severity of the Covid-19 infection, making it difficult for caregivers to provide assistance.

Already, for Unikovsky; Santarem (2020), the care of the elderly patient with delirium during the Covid-19 pandemic by the nursing team is fundamental and they should receive training for the early recognition of the signs and symptoms of this condition. Thus, with evidence and other skills in care, it will
be possible to develop safe and comprehensive care. In this sense, the research in question returned 47.05% (N1, N3, N4, N8, N10, N14, N16 and N17) articles which are in line with the research of these authors when referring that the elderly hospitalized with Covid-19 are more likely to develop delirium.

One of the limitations found in this research is the scarcity of studies comparing delirium superimposed on dementia with dementia alone. According to the study by Duggan; Van and Ely (2021), about 80% of patients with dementia manifest behavioral and psychiatric changes at some point in the establishment of this disease. This can hinder the identification of a possible delirium condition, as the symptoms may be similar. These symptoms can include altered sleep quality, anxiety, paranoia, agitation, hallucinations, and irritability. Thus, it is imperative to understand a patient's initial psychiatric status in order to find out whether one of these clinical presentations is likely to be caused by delirium.

Another limitation found is the difficulty in finding studies that report the diagnostic validity of screening tools for delirium. In this sense, Duggan; Van and Ely (2021) point out that some of these testing tools that have been validated in patients with dementia previously require patients to be verbal, for example, which can be a barrier to the implementation of this test in ICUs.

Finally, it is worth noting that investigation of the treatment or prevention of delirium is crucial and implements practices for recovery. Thus, it is important for health professionals to assess delirium and monitor symptoms in patients with Covid-19, in order to organize and early diagnosis of these patients, avoiding the high mortality rate (Benussi et al., 2020; Helms et al., 2020; Hariyanto et al., 2021; Shao et al., 2021; Lahue et al., 2022).

It is worth noting that delirium is considered a public health problem and it is a geriatric emergency that has not yet been explored. This corroborates the lack of extensive studies and confirms the scarcity of materials in some databases, as, for example, only results were found in Pubmed containing the descriptors used for this research.

5 CONCLUSION

From the results presented, it is concluded that the early diagnosis of delirium in patients with Covid-19 is crucial for the patient to have a good prognosis in the face of the adversities presented by the pathologies. Delirium affects mainly elderly males over 65 years of age and its symptoms may not be noticed during this condition. Thus, constant monitoring during the different phases of the day can help detect signs and symptoms of delirium in patients infected with SARS-CoV-2 and avoid worsening prognosis. Thus, screening tools such as the 4-AT, the Chart-Based Delirium Identification Instrument and the Diagnostic and Statistical Manual of Mental Disorders 4 and 5 could be consolidated as indispensable for the early detection of delirium.

The integrative review limited the search to only include publications in the last five years, however, due to the SARS-CoV-2 pandemic being more recent, the articles were mostly even more recent, however, it captured the most relevant articles and, therefore, provides a good overview of the currently available
evidence on the correlation of delirium as an aggravating factor for Covid-19, with a considerable worsening of the prognosis. Future reviews may consider a greater number of evidence through new articles on the topic, including systematic reviews on the topic, as well as the use of other risk of bias assessment and quality assessment tools used in systematic reviews.

Finally, it is important to highlight that future studies should be focused on the search for rapid detection and the evaluation of the effectiveness of delirium prevention strategies in elderly patients with Covid-19.

ABSTRACT
The general objective of the research was to propose collection strategies that allow reducing delinquency in the company Martyni Campestre, Garzón, Colombia. The non-experimental research design was used, since it did not perform any manipulation of the variables studied, likewise the research had a sample of 6 collaborators belonging to the area in charge of collections, who were evaluated through the application of surveys, with the purpose to collect information regarding the situation of the company. In this way, the results allowed us to conclude that the company Martyni Campestre, Garzón, Colombia does not have adequate collection strategies, as well as a lack of training for workers to carry out effective tasks regarding the collection of debts, making this lack of motivation both employees and customers, lead the company to face high levels of delinquency of its customers, consequently affecting the company's profitability.

Keywords: Collection strategies, delinquency, company.

1 INTRODUCTION

In the midst of the economic crisis, concern about non-payment saw its greatest fear, since clients of credit institutions saw their payment capacity limited, increasing delinquency levels to a historical level of 7.29% in 2009. As a result of this, these institutions were forced to redefine their collection operating model, increasing communication with the client, redesigning products according to the needs and segments of the population. This process allows for a parallel reduction in the number of costly procedures such as personal visits and telephone calls, since efficient collection management begins with good administration of the credit issuance process. (Deloitte, 2015)

In contrast to what happened in the banks, the electrical appliance stores tightened their credit conditions and strengthened their collection management, in order to counteract the negative effects of the drop in sales. According to El Financiero (2010), of every ten sales, between five and eight of them were credit sales. The largest commercial stores in Costa Rica adjusted their collection strategies, increasing the personnel in their call centers by 10%, incentives for both customers and workers in the collection area, eliminating or making other strategies more flexible, strengthening the structure of recovery and review of credit profiles, to deal with the delinquency of its client portfolio.

However, delinquency has caused irreversible collateral damage, as reported by Bolsamania (2015), Banco Azteca closed 442 branches due to the drop in income and high levels of delinquency in its portfolio...
that reached 7.9%. Likewise, the latest study on credit risk management in Spain prepared by the Cash Management Observatory (2016) showed that 74% of companies suffer as a result of delinquency, of which 31% suffer significant defaults and 13% are at risk of closing. Delinquency registers a worsening in the behavior of payment terms since 2012, where two out of three companies suffered defaults, a historical maximum that this year was reduced in defaults in one of every three Spanish companies. The situation is aggravated insofar as Law 15/2010 on Measures to Fight Late Payments is only respected by 43% of companies, who work with periods of less than 60 days.

Similarly, poor accounts receivable management has a major impact on a company's economic efficiency. Torres, Jiménez, Pérez and Jiménez (2011), argued that the Construction Materials Company of Las Tunas in Cuba, by not applying financial techniques in the administration of its accounts receivable, limited the efficiency in collection management, decreasing both its working capital and its liquidity levels, and with it, hindering cash turnover and increasing economic efficiency. Among other deficiencies in which it tends to fall is in not calculating the costs involved in the management and maintenance of accounts receivable, poorly trained staff in the economic accounting area in the administration of accounts receivable.

In this sense, the lack of a clear credit management culture (credit management) still affects 83% of companies, as they have had to accept terms longer than desired, and the low capacity of SMEs to impose payment terms affects 38% of their business relationships with their suppliers. Among the reasons for not paying, experts point out: "The main cause is the unavailability of funds from customers, followed by intentional delay." But there are other reasons, such as the complexity of the payment procedure, billing errors, or even business disputes. (Cash Management Observatory, 2016)

Crédito y Caución (2016) assure that despite the efforts to promote two months as time for the payment of invoices, “the collection periods oscillate above 89 days. "Protection against non-payment begins with the improvement of financial information about your client to prevent."

In Colombia, according to TransUnion (2021), delinquency worsened in an annual comparison. Delinquencies at the balance level of 60 days or more increased to 5.1% in the third quarter of 2021, from 3.5% in the third quarter of 2020 (an increase of 160 basis points). This increase in non-performing loans was observed in all credit products except in warrants, with free investment loans, cards and microcredits being the ones that registered the greatest increases. Relative to pre-pandemic levels in the third quarter of 2019, microcredit and cards showed the largest increases.

Rivas (2014) showed that with the implementation of an adequate collection management model, greater efficiency can be obtained in the collection of income from maintenance and memberships, and the organization of collections. Classifying and monitoring delinquency by amount and periods of days in arrears leads to establishing strategies that reduce days in arrears in amounts pending payment. Preventing delinquency must be guided from the first day with the understanding of the benefits of being up to date with payments, it will give the company a greater capacity to comply with its payments to suppliers.
Delinquency has become one of the main problems for companies, which focus: on liquidity problems, on having to use the accumulated profit to cover non-payments or delays; the negotiation of longer terms with suppliers; downsizing and lastly, they can go so far as to resort to insolvency proceedings or to the closure of the company for this reason.

In this context, this research focuses on the company Martyn Campestre, located in the city of Garzón, Huila, Colombia, and whose main activity is the accommodation of tourist farms (rural accommodation). This company has as a sales strategy, selling on credit, an action that has allowed it to increase its level of sales, but in contrast, a certain proportion of its credit customers are constantly late in their payments and others simply do not pay their obligations to the company. Although it is true, increasing levels of sales are appreciated, the increase in delinquencies is a negative effect of credit sales, added to this the COVID 2019 pandemic, would be affecting the company's profits.

Given this, the question was raised: How do collection strategies as an instrument reduce delinquency in the company Martyn Campestre, Garzón, Colombia?

With the details observed, a situation of maladministration was foreseen in terms of the collection strategies used, since their management is empirical and therefore, the results are not efficient or satisfactory for the business life of the establishment. Therefore, it was proposed as objectives to analyze how is the development of the collection strategies of the company; determine the level of delinquency and prepare a proposal for the development and implementation of collection strategies that will reduce the level of delinquency of the company Martyn Campestre given the serious problem of maintaining uncollectible accounts.

### 2 MATERIALS AND METHODS

#### 2.1 RESEARCH TYPE AND DESIGN

The research was non-experimental and cross-sectional, since the study variables were not manipulated or altered, on the contrary, they were only studied and evaluated in reality, in addition, information was obtained from the object of study at a given time.

The design was descriptive, correlational, quantitative since it used quantifiable methods and measurement techniques such as the survey that allowed describing the magnitude of each study variable (the problem raised), to then establish cause and effect relationships, which were presented in the following ideogram.
Where
Y= Delinquency
X= Collection strategies
M=Sample
R=Ratio

2.2 VARIABLES
Dependent variable: Delinquency
Independent variable: Collection strategies

2.3 POPULATION AND SAMPLE

Population
The population was made up of 26 workers from the Martyni Campestre company in Garzón, Huila, which is a total of 26 workers.

Sample
The sample consisted of the 6 workers belonging to the collection area, as it is the central focus of the investigation.

2.4 DATA COLLECTION TECHNIQUES AND INSTRUMENT
The data collection technique was the survey and the questionnaire was used as an instrument for the quantification of the variables.

2.5 INSTRUMENT VALIDITY AND RELIABILITY

<table>
<thead>
<tr>
<th>Table 1: Reliability analysis - Cronbach's Alpha for the collection strategies variable</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
</tr>
<tr>
<td>------------------------------------------------</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td>Source: self made</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Table 2: Reliability analysis- Cronbach's alpha for the Delinquency variable</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
</tr>
<tr>
<td>------------------------------------------------</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td>Source: self made</td>
</tr>
</tbody>
</table>
Which means that the alpha test is high in both cases, the values of 0.879 and 0.960 are acceptable and positive values about the reliability of the instruments.

2.6 ANALYSIS OF DATA

For statistical data processing, SPSS 23 software was used for Windows in Spanish and Microsoft Excel. The data was presented in tables and figures.

For the data analysis of the collection strategies variable, the questionnaire has 14 items and the responses were organized into 5 categories:

<table>
<thead>
<tr>
<th>Alternatives</th>
<th>Category</th>
</tr>
</thead>
<tbody>
<tr>
<td>Never</td>
<td>1</td>
</tr>
<tr>
<td>Rarely</td>
<td>two</td>
</tr>
<tr>
<td>Sometimes</td>
<td>3</td>
</tr>
<tr>
<td>Almost always</td>
<td>4</td>
</tr>
<tr>
<td>Always</td>
<td>5</td>
</tr>
</tbody>
</table>

Source: self made

The minimum value of the sum of the answers is 14 (if all answer 1) and the maximum value is 70 (if all answer 5), the difference is 56 which is the evaluation range. For the purposes of the investigation, the answers are developed under three categories (inadequate, regular, adequate), for which the amplitude is 19 points per category; as shown in table 4.

<table>
<thead>
<tr>
<th>Minimum</th>
<th>Maximum</th>
<th>Range</th>
<th>Amplitude</th>
</tr>
</thead>
<tbody>
<tr>
<td>14</td>
<td>70</td>
<td>56</td>
<td>19</td>
</tr>
</tbody>
</table>

Source: self made

Therefore, the form of category evaluation would be as shown in table 5.

<table>
<thead>
<tr>
<th>Alternative</th>
<th>Since</th>
<th>Until</th>
</tr>
</thead>
<tbody>
<tr>
<td>Inadequate</td>
<td>14</td>
<td>32</td>
</tr>
<tr>
<td>Regular</td>
<td>33</td>
<td>51</td>
</tr>
<tr>
<td>Appropriate</td>
<td>52</td>
<td>70</td>
</tr>
</tbody>
</table>

Source: self made

Therefore, the answers will be presented in tables of 3 categories (inadequate, regular and adequate).

For the case of the other variable, the same procedure was carried out; unlike the treatment of the value of the answers, as shown in table 6.
Table 6: Treatment of the value of the answers

</tr>
</tbody>
</table>

Source: Own elaboration (questionnaire)

Figure 1. Distribution of categories of the collection strategy of the company Martyni Campestre. (Source: table 7)

In table 7 and figure 1, it is observed that the collection strategies applied by the company Martyni Campestre are inadequate by 50%, results that are supported by the research of Rivero and Alby's (2014) and Carrasco and Farro (2014) who found significant deficiencies in the management of the credit and collections area that affect delinquency in the Venezuelan company VENVIDRIO and VANINA EIRL, respectively. Likewise, Aguilar (2013) concluded the importance of the management of accounts receivable in the liquidity of the contractor company Corporación Petrolera SAC that although it can cover...
its short-term debts, there is inadequate management of accounts receivable in terms of periods, lengthy collection.

3.2 DELINQUENCY IN THE COMPANY MARTYNI CAMPESTRE

Evaluation of the delinquency variable in general terms:

<table>
<thead>
<tr>
<th>Scale</th>
<th>Frequency</th>

<tr>
<td>Appropriate</td>
<td>0</td>
<td>0%</td>
</tr>
<tr>
<td>Total</td>
<td>6</td>
<td>100%</td>
</tr>
</tbody>
</table>

Source: Own elaboration (Questionnaire)
In table 8 and figure 2, it is observed that the delinquency of the company Martyni Campestre is regular at 50% jointly. Among its dimensions, only the High Risk Portfolio dimension presented a low percentage of inadequate, unlike the dimensions Overdue Portfolio and Heavy Portfolio, which do present high percentages of 67% and 50% as inadequate, respectively (tables 9, 10, and 11). These results are contrasted with those obtained by Castañeda and Tamayo (2013) who verify the non-compliance of the objectives of the municipal fund of Trujillo given the high levels of delinquency due to the intensification of the recovery of its credits, lower placements, deterioration of its portfolio, etc.

Therefore, as strategies, it was proposed to analyze the factors that affect collections and delinquency of the company Martyni Campestre, as well as follow up on credits, development and updating of a customer database, training for staff so that they can at all times, encourage the client to be punctual with their payments and not fall into arrears, as in Ortigsa (2011), Arteaga and Ojeda (2011) and Rivas (2014).

Finally, we consider that this research is a contribution that will contribute to future research and new methods of addressing the issue of collection and delinquency strategies.

3.3 PROPOSAL

Plan to improve collection strategies as an instrument to reduce delinquency in the company Martyni Campestre, Garzón, Colombia

3.3.1 Rationale

The company Martyni Campestre, with NIT number 1077861932-4, its legal representative Fabian Mauricio Martinez Fernandez, the company began its activities in 2019 on August 21, it is a family business, initially it was a family project that over the days has been transformed into a great project for tourists and visitors, with a sense committed to our region and our Huila cultures, we have a national tourism registry number 75126, we also have an international seal "Certified Check In" it complies with biosafety protocols, it is located within the magic route of coffee at kilometer 5 via Zuluaga Vereda Claros Garzon Huila Colombia. Its main economic activity 5514 Rural Accommodation, we have family cabins, a viewpoint where you can appreciate the Garzón landscapes, we also have glamping service, we are a company that provides respect to its employees, transparency and honesty, adding, creating value is the purpose of any business and that must be contemplated in the principles of a company.

The company Martyni Campestre experiences a high degree of delinquency in its accounts, which does not allow it to adequately develop its business growth activities, for which one of which is the inadequate implementation and development of collection strategies that start from managers and of the workers in charge of the collection area, the current situation and the key points to take to improve delinquency levels are shown in the following table:

4 OBJECTIVES

a. GENERAL OBJECTIVE

Establish collection strategies that reduce the level of delinquency in the company Martyni Campestre.
b. SPECIFIC OBJECTIVES

Analyze internal and external factors that affect the collection and delinquency strategies of the company Martyni Campestre.

Implement precise actions and activities that improve collections and reduce delinquency of the company Martyni Campestre.

4.1 PROCEDURES

<table>
<thead>
<tr>
<th>Goal</th>
<th>Activities</th>
<th>Necessary resources</th>
</tr>
</thead>
<tbody>
<tr>
<td>Analyze internal and external factors that affect the collection and delinquency strategies of the company Martyni Campestre.</td>
<td>Situational analysis of the collection strategies of the company Martyni Campestre.</td>
<td>Company executives hand in hand with researchers</td>
</tr>
<tr>
<td></td>
<td>Situational analysis of customer delinquency</td>
<td></td>
</tr>
<tr>
<td>Implement precise actions and activities that improve collections and reduce delinquency rates of the company Martyni Campestre.</td>
<td>Credit follow-up.</td>
<td>Collection staff.</td>
</tr>
<tr>
<td></td>
<td>Development and updating of a customer database.</td>
<td>Service of a specialist for the creation of the base according to the company’s clientele.</td>
</tr>
<tr>
<td></td>
<td>Awareness to customers about the benefits of being up to date with payments.</td>
<td>Sales staff</td>
</tr>
</tbody>
</table>

4.2 STRATEGIES

A. Analysis of the strategies:

Proactive strategies: inadequate in 33% and regular in 50%

Productivity: Inadequate in 50% and regular in 33%

Information management: Inadequate in 33% and regular in 50%

Policies and processes: Inadequate in 33% and regular in 50%

The previously presented analysis of the study variables allowed us to identify deficiencies in the collection area of the company Martyni Campestre that affect its level of delinquency and therefore, the stability of the company in general. Therefore, the following table shows the perceived deficiencies and the strategies that have been considered convenient to propose against them.
Table 2: Elaboration of strategies

<table>
<thead>
<tr>
<th>DIMENSION</th>
<th>DEFICIENCIES</th>
<th>STRATEGIES</th>
</tr>
</thead>
<tbody>
<tr>
<td>proactive strategies</td>
<td>Lack of programming in loan payment dates</td>
<td>Involve the customer in scheduling payment dates</td>
</tr>
<tr>
<td></td>
<td>Absence of personnel in charge of monitoring complaints and claims</td>
<td>Timely address complaints and claims</td>
</tr>
<tr>
<td>Productivity</td>
<td>Poor accounts receivable management</td>
<td>Create an Internal Control unit</td>
</tr>
<tr>
<td></td>
<td>Lack of training for workers in the collection area</td>
<td>Periodically train collection workers</td>
</tr>
<tr>
<td>Information management</td>
<td>Poor use of customer information in delinquent status</td>
<td>Implement and constantly update a customer database</td>
</tr>
<tr>
<td></td>
<td>Lack of follow-up to customers in delinquency</td>
<td>Make reports and continuous monitoring of the client's situation</td>
</tr>
<tr>
<td>Policies and processes</td>
<td>Absence of regular customer evaluations</td>
<td>Intensify customer contact</td>
</tr>
<tr>
<td></td>
<td>Instability of defined processes to carry out collections</td>
<td>Implement a collection policy manual or directive</td>
</tr>
</tbody>
</table>

Source: self made

B. Actions and activities:

ACTION 1: Improve proactive strategies

Activity 1.1. Create a system to properly keep the order of receivables.
Activity 1.2. Have a staff responsible for receiving complaints and claims from customers.
Activity 1.3. Establish a person in charge of monitoring the claims made by clients.

ACTION 2: Improve the productivity of collaborators in charge of collection

Activity 2.1. Permanently use the collection register.
Activity 2.2. Design a persuasive personnel selection system in terms of the collection area.
Activity 2.3. Permanently train collection managers in collection strategies and legal framework.

ACTION 3: Improve the collection information management system (updating and real)

Activity 3.1. Permanently update the list of people in debt.
Activity 3.2. Permanently evaluate the record of debtor clients.

ACTION 4: Expand and focus collection policies and processes

Activity 4.1. Make collection managers aware of the need to reduce the degree of delinquency.
Activity 4.2. Clearly define the actions that follow a collection process, that is; establish a collection process plan.

5 FINAL CONSIDERATIONS

We think that the strategies that are applied in terms of credits and collections are key to controlling delinquency in a company that sells on credit. The efficient development of the responsibilities of the personnel of said areas allows to promote better results as a whole, not only due to the better rating of the client portfolio to whom a loan is granted, but also around the general organizational development of the company.

It is concluded that in general, the collection strategies of the Martyni Campestre company are inadequate by 50%, since they have not been carried out in a timely manner, an updated record of customer credits is not kept, those in charge of the collections do not know how to collect debts due to the lack of clear and timely collection policies and processes, lack of clear payment dates, lack of motivation and training, which increases delinquency by customers and by therefore, the company is affected.

It is also concluded that the company Martyni Campestre, by not being able to carry out the collection of its debts in an adequate, timely and consistent manner, over time has come to obtain greater debts that have not been collected, allowing profitability of the company deteriorates. Credit sales have brought with it that the company has among its portfolio credits classified as doubtful, deficient and in loss. Delinquency is regular at 50%.

Finally, the deficiencies found in the collections area of the company Consorcio Moviza SRL allowed establishing strategies such as raising awareness among customers about the timely payment of their credits, timely attention to complaints and claims, internal control, continuous training for collection personnel, incentives for staff and non-delinquent clients; implementation and constant updating of an information system on customers and their credit situation, as well as the implementation of a collection policy manual.

ABSTRACT
The electric sector in the Amazon needs to diversify fossil fuel supply sources, as well as encourage the use of renewable energy sources, so the project carried out a critical study of energy generation sources and their use to ensure the supply of electricity from an environmentally sustainable way to electrify isolated systems in the Amazon. From this, an art study was carried out on the main sources of renewable energy used in Brazil and the Amazon, characterizing the current costs of electricity generation in these isolated communities, with this it became evident that for these systems the sources of renewable energy generation most viable according to the cost analysis carried out in this work are solar and biomass.

Keywords: Amazon, Biomass, Renewable Energies, Isolated Systems, Solar Photovoltaic System.

1 INTRODUCTION
The current Brazilian energy matrix is favorable to the use of renewable sources, but still has in large majority the presence and dependence of resources from fossil fuels, mainly in the isolated systems of the Amazon where the costs of transport and fuel are very high. In these isolated systems, in some cases, the energy distribution services are precarious or even non-existent.

The north of the country is home to a huge number of non-electrified communities, with different sociocultural and geographical characteristics. Due to the immense territorial dispersion, energy distribution in the interior of the Amazon is generally considered unfeasible by concessionaires due to the extensive networks composed of kilometers of wires and several poles to serve a very small number of residents (FREITAS; SANTOS; CASTRO, 2019).

In November 2003, the Federal Government launched the “Light for All” Program (PLT) with the objective of universalizing access to electricity throughout the country. Since the publication of Decree No. 4,873, of November 11, 2003, and its extension from 2015 to 2018, the program has already made investments that exceed 22.7 billion reais. About 15.5 million people have already been served throughout
the country. (FREITAS; SANTOS; CASTRO, 2019).

Access to electricity can facilitate the integration of isolated communities to public services and social programs. It is also expected that it will be possible to improve water supply, health services, education, as well as allow access to household appliances and equipment to support rural production (FREITAS; SANTOS; CASTRO, 2019).

Promising renewable sources such as wind energy, photovoltaics and biomass have currently stood out in power generation. Among them, biomass has been indicated as an alternative capable of reversing the “scenario without light” in the Brazilian Amazon. Biomass is any renewable resource derived from organic matter (of animal or vegetable origin), by-product of agricultural, rural, forestry, agro-industrial activities, such as husks, sugarcane bagasse, rice straw, sawmill residues, food residues, poultry, swine and cattle, whey, remains of oilseeds used for oil extraction, which can be used as fuel. It is available in large quantities on farms, does not require transport, is low cost and can be operated in individual systems. The option to use biomass, in a rational and sustainable way, in the Amazon, values the standing forest and, therefore, contributes to its conservation.

Another very promising alternative is the use of energy from photovoltaic panels, given the great potential for solar incidence in the Amazon region, as well as the low maintenance costs of these systems and the minimum environmental impact caused in these communities. However, they require a high initial investment and depend on the seasonality of the region, so the adoption of hybrid systems such as biomass-fuels or solar-fuels will be good alternatives and can meet the demands of these systems efficiently and safely.

Therefore, the general objective of this work is to carry out a study of energy alternatives based on renewable generation sources for electrification in isolated systems in the Amazon.

The place of analysis will be the isolated systems of the Amazon, characterized by riverside communities, indigenous areas and quilombola communities, in addition to conservation units that are not served by the National Interconnected System (SIN). Bibliographic researches were carried out in books, articles, monographs, theses, manuals, catalogs and magazines published in the last five years and that are relevant to deepening the subject under study and collecting data and information relevant to the work.

2 MATERIALS AND METHODS

The research project is characterized by the realization of a state of the art on energy generation for the electrification of isolated systems in the Amazon, as well as the execution of analyzes of energy alternatives that can be used to meet the needs of these communities. The place of analysis was the isolated systems of the Amazon, characterized by riverside communities, indigenous areas and quilombola communities, in addition to conservation units that are not served by the National Interconnected System (SIN).
were carried out in books, articles, monographs, theses, manuals, catalogs and magazines published in the last five years and that have relevance for the deepening of the subject under study and collection of data and information relevant to the work.

Based on these bibliographic researches, the identification and mapping of isolated systems in the Amazon was carried out. Featuring its current ways of generating electricity. And with this mapping, a study of the potential of these isolated systems is carried out to determine which source of renewable energy is most appropriate to meet the energy demands of these regions. It was determined that the renewable energies that best fit these regions were Photovoltaic and Biomass Energy, with this a survey of the costs of implementing these renewable sources in the isolated systems identified was carried out. Finally, a study of the environmental and socioeconomic impacts was carried out after electrification in these communities.

3 RESULTS

Based on the results obtained from the research, two tables were created referring to the cost of implementing such energies in communities in isolated systems in the Amazon:

Table 1. Concerning the costs of a biomass system for a 1 kW gasifier.

4 CONCLUSION

According to the research carried out, it can be concluded that the most viable alternatives for the electrification of isolated systems in the Amazon are solar photovoltaic energy, a clean source with availability of solar radiation throughout the day and good efficiency, as well as biomass, which is a source renewable resource that can be generated through the community's own agricultural activities and does not cause major environmental impacts, in addition to hybrid systems that are safer and more stable as they do not depend on seasonality and local climate.

The electrification of isolated systems in the Amazon through renewable sources is extremely important because it generates more employment and income opportunities, improves education and health, in addition to providing a more dignified life to the population of these communities.

These energy sources do not strongly harm the environment and generate sustainability since the residents of these regions can use the residues of their agricultural productions to generate energy, for example.

ABSTRACT

O study developed The leave gives question: which practices, standards and methods would be representatives of the institutionalized school culture in schools in southeastern Goiás, in the first a half of century XX? THE presence in practices, standards and methods investigated in three institutions schoolchildren, whose sample contemplated two schools confessional and one school agricultural federal, per quite gives Query The sources From collections schoolchildren, sought aspects distinct gives culture school internal. At the route methodological, dedicated The to locate you documents, characterize the sources by affinity and similarity, in order to obtain the variables that corroborate in the interpretation of traces of school culture marks in institutions, focusing on practices, norms and methods inscribed in official documents, referenced in authors and works from the history of school institutions. In the results we show The existence in practices, standards and methods, watching similarities and singularities, so much in the format and in the pedagogical didactic organization of these institutions, among the which stand out: you ends and goals educational, The emphasis at the disciplining gives conduct internal (regulations, norms, teaching programs, timetables, calendars); the interfaces of school with the society place and regional; the prescription of ducts and routines; O cult in internal symbols and rituals; the manifestations of obedience, discipline, and transgression; you levels in status and the representative distinctions gives schooled education.

Keywords: institutions school children, standards, practices, methods, culture school.

1 INTRODUCTION

To contextualize at institutions and trigger you concepts centrals used in this study, it is necessary to understand that the simple demarcation of a space-time, as well as the announcement of a theoretical-conceptual field alone would not be enough to characterize the shows, if the same (context and concepts) were not inserted and applied in the dynamics and in the movement of relationships that made up the modus operandi of school institutions and school culture inscribed and materialized in them. In this understanding lies the dialectic of use and appropriation of these tools. Let us consider, then, at singularities perceived at schooled education in southeastern Goiás, in the first half of the 20th century, perceived in the of the institutions indicated in this sample, given some common aspects, such as, connection as a means of communication and transport, the existence of the railroad that linked the region to the states of Minas Gerais and São Paulo, providing access to manufactured goods, as well as the
possibility of draining inputs from the production agriculture and livestock. It is in this complex and multifaceted context that we identify the three institutions used at discussion in lathe From themes and objects referenced in this rehearsal.

When configuring the Brazilian municipalities, inherited from the federative model established in the Império, Almeida Barros, França and França (2020), point out some traits that marked the implementation of the federated units in the republican state, especially in what concerns refers The education and to school institutions:

At the beginning, the created municipalities had in common characteristics such as the predominance of the quantitative population located in the rural area, with a urban formation established in a given space. The existence of a core urban organized would be condition for justify The emancipation administration of the municipality, with the installation of state equipment, with positions, functions and demarcation From powers constituted, at the scope executive, legislative and judiciary, among others. You Dice politicians administrative procedures referring to the origin of these federative units include similar provisions, namely, to aggregate in the urban space the services public, the trade in manufactured goods and the businesses that characterize the activities productive, so as The condition in county, under The which if it links small towns and villages with less democratic density. This conformation includes the presence of the church and education with the installation of schools in different formats. Therefore, the institutionalization of education would be a fundamental component in the existence of the municipality. (ALMEIDA BARROS, FRANCE AND FRANCE, 2020, p. 104324).

While in others regions of country, at first a half of century XX already if experienced at news gives education republican per quite of rigging From school groups taken as expressive investment in urban institutions, in this fraction of state in Goiás, The education conserved strokes remnants of Final of empire, marked, greatly, per one population predominantly rural, low density population and the absence of services and supports representative of the presence of the state state and secular. Nagle (1974), when configuring the context of Brazilian society in the First Republic, is not very optimistic about the changes promised by the regime in relation to the structure Social and The power maintenance.

(...) The transition of regime monarchical for O republican no implied transformation most deep From fundamentals social gives society Brazilian. Under O new regime political remained, virtually, The same power structure, same mentality, same institutions basic, anyway, you same interests From groups or classes what if structured in the imperial period, although it can be said that 'the Republic already no corresponds The one society aristocratic and slave. Is it over there It is, deep, a bourgeois movement'. (NAGLE, 1974, p. 283).

Elapsed at decades initials identified at historiography gives education as Republic Old or First Republic, few advances and changes at the touching to school equipment in localities marked by the demographic void, whose needs would be fulfilled by the official presence of the Catholic Church, through parishes, clergy and dioceses, in place of to the distance of state services.

Such correspondents reflect the contradictions and complexities that involved the many different provinces, in Special, When visualized your dimensions territorial at population and occupation dynamics. If the republican promise of education had prioritizing the installation of school groups in urban spaces, so what could a region whose population was concentrated in rural areas? For this purpose, it is convenient
Consider what:

These stays verified in the municipalities, kept with the same status in the republican system, may have correspondence under multiple aspects with the modes of representation and organization of local power, in the influence with at hierarchies of state; That It is one dimension what deserve a more accurate look in the sense of visualizing the dispositions that demarcate The vitality (or at difficulties) of place inside in a context regional and state. In sum, considered at many different scales gives bureaucracy of state, since you first records officers allusive The occupation, settlement and demarcation of properties in the hinterland of Goiás, the configuration of authorities and local representatives projected leaderships of expression regional, state and national, with narrowing in interests at ball and attracting diverse benefits to the municipalities represented. (ALMEIDA BARROS, FRANCE AND FRANCE, 2020, p. 104325).

Other factors such as the scarcity of public resources in the municipalities, lack of subsidies of central governments would indicate a scenario of omission regarding the offer of schools and places for The instruction public destined to the villages, districts and regions rural. All that contrasted with the awakening of development in the agricultural and livestock sector, driven by the increase in transport routes from the southeast of the country towards the plateau central, crossing the microregion called Southeast Goiás.

Source: IBGE/ DICE FROM THE CENSUS IN 1940 and 1950.

In the first decades gives Republic, Goiás canned one structure oligarchic inherited of Empire, at
which at elites policies and commercials if concentrate us centers urban areas, the State bureaucracy is present in the capital, being almost inexpressive in the villages and in the small cities. THE elite rural and agrarian compose poles regional, second at activities developed, with the increase of agricultural production oriented towards the great centers consumers, notably you States of Southeast of Brazil, for Where if intended practically the entire production of livestock and agriculture in Goiás at the time. in the regions benefited per railroads and roads, The Communication, O business and you Business they were facilitated, mainly with states neighboring Goiás. Inverse situation, isolation and scarcity, was observed in the regions of the alto sertão, where transport and commerce only were carried out with the use of animals and rudimentary vehicles. By the way, Palhano (1922) makes a description of the slowness in the construction of the railway network designed for the Center-West and Southeast, which through O Empire and enters the Republic.

Goiaz would have, in addition to the above mentioned railway communications to the ports of Rio and Santos, two mixed routes, rail-river, that would cut the State from South to North, giving you an exit through the Port of Belém do Pará and also serving the state of Matto-Grosso for the navigation of the Rio das deaths and Araguaia. (...) Today, 30 years later, it is curious examine the part of this vast plan that was implemented. The railroad tracks Mogiana penetrated into the lands of the Triangulo Mineiro and were continued by the gives Road in Iron Goiás, what serve The City in Catalan and temporarily stopped, on the other hand, on the banks of the Corumbá River, tributary of the Paranahiba, in the south of the state of Goiaz. Not one more inch railroad counts this vast state. (...) The extension of the Estrada de Iron West in Mines up until trunk at Road in Iron Central of Brazil, in Bar tame, if he thinks opened, but you others two no they are concluded, reaching the line from Pardões and Formigas to Patrocínio and having construction of its extension was suspended, as well as that of the branch de Araxá, which departs from S. Pedro de Alcantara, bound for Uberaba. (...) The road from Goiaz to Cuiabá and the road from Catalão to Palmas did not begin, that should pass in the region designated in the Federal Constitution for headquarters gives future capital gives Republic, in the nearby gives City goiana in Formosa. (PALHANO, 1922, p. 730. It was conserved The spelling original).

This disparate reality at the beginning of the Republic characterizes Goiás as a unit federation endowed with a vast territorial extension, marked by demographic voids, with a population concentrated in rural areas, distant urban centers and difficult to access. THE shortage of transport, the inexistence of routes of displacement sometimes made it difficult to contact of the municipalities located in the southeast of Goiás with the capital of the state of Goiás. THE organization of that society The era, reserved at due proportions, if resembles The organization country social:

The truth is that we have very different social classes; - the rich in small number, mixed The class average, composed in intellectuals, industrial, merchants etc., creatures well born, in general wealthy, or a little less, with aspirations, vain, lined with prejudices; - you proletarians, manual laborers, beings for hire, who work forno if leave to die in hungry, in general exploited and mistreated, constituting the majority; - finally the riffraff, the social refuse originated, by degradation, in all layers. (NAGLE, 1974, p. 111).

In general terms, it could be defined that the Goiás elite was constituted by this group of well-born and wealthy people, farmers and regional authorities who made up the bureaucracy of the State, while the
majority of the population was dispersed in the remote rural areas, in towns and small towns. The 'people' formed the workforce manual labor devoid of qualification or formal instruction. They were almost always individuals without no link with land ownership, despite making management activities agricultural and livestock O main quite in survival; if occupied mainly gives installment in services in countryside and villages.

In relation to Goiás, the Chief Executive of Goiás, when addressing a message to the legislature, drew The teaching situation in decade in 1930:

(...) Currently, primary education comprises: preparatory education, given to children from 4 to 6 years old, in kindergartens, attached to the normal schools with a three-year course; primary education itself said, at children in 7 The 12 years, in the schools rural with two years incourse; in the urban singular schools, with three years of course, in the schoolchildren with a three-year course; and complementary primary education, in complementary schools, with a three-year course, for children over 10 years old, who have a state primary school diploma or a license in exam of sufficiencies . (POST OFFICE OFFICIAL, no. 1,702, 31 in May from 1930, p. 13)

The gaps left by the secular state would open spaces for the authorities of the church to expand their ecclesiastical territory, through strategies such as the installation of new dioceses and parishes, foundation of schools and social assistance institutions. At majority From cases at authorities religious had total support and support of elites and local civil authorities. Riolando Azzi, Catholic historian emphasizes the role of recomposition assumed for the church in first decades of the twentieth century.

THE The end in reaffirm The influence and O power gives Church Catholic about The society Brazilian, according The line mistress from the project restorer, you bishops hoped to count on the support and collaboration of political power. Was through an action of the State itself that the ecclesiastical hierarchy dreamed of reacquire the old prestige and privileges it enjoyed within the regime confessional in force in the colony and not empire. (AZZI, 2008, p. 206).

In this scenery, you bishops constituted themselves us main intellectuals gives expansion ecclesiastical, instructing, encouraging and coordinating The attraction in many different orders religious to occupy new parish spaces in promising cities, towns and districts. Such strategies were successful in Goiás, mainly due to the sagacity and leadership of Dom EmmanuelGomes de Oliveira, Bishop of the Diocese of Goiás. The prelate using his experience (as parish priest) with educational institutions in Campinas (SP) and Rio de Janeiro, to pave the way for female religious congregations to act in the institutionalization of Catholic schools in several regions of Goiás. In the southeast of Goiás, its action was notorious, in particularly in the 1930s, when, with the support of the local parish priest, he managed to bring Campinas for ipameri The Congregation of missionaries in Jesus crucified, with The purpose of implementing the Nossa Senhora Aparecida School. In the following decade (1940s), a similar action was undertaken by the bishop when he commanded the coming to the USA of Friars of the Franciscan Province of the Most Holy Name of Jesus (New York) and the Franciscan Sisters in allegany (Allegany). Such enterprise outside significant at structuring in a ambitious project of occupation of the ecclesiastical territory through the missionary
work of the two orders Franciscans. To install parishes in many different places, founded schools primes and secondary Only at the Southeast Goiás you Franciscans created and maintained Parish Schools in Catalan (Saint Bernardino of Siena), Goiandira (Santa Maria Goretti) and Pires do Rio (Sacred Heart of Jesus), enhanced the liturgical/catechetical in the cities, districts, towns and rural areas.

In another aspect, some regional political leaders, attentive to the from the federal government to encourage the opening of new frontiers directed towards the interior of country, also if expressed per quite gives submission in decrees and projects what allow channel resources and benefits for places of southeast goiano. In particular, we refer to the decree creating the first federal Agricultural School in Urutai at a half gives decade in 1950, for the action of a deputy from Ipameri.

Of set in documents obtained in files institutional and private, In this exhibition, we extract evidence of school culture inscribed in two Catholic institutions (School parish Santa Maria Goretti, in goiandira and school Our Madam Aparecida, in Ipameri) and in a federal public institution (Escola Agrícola Federal, in Urutai). In them we demarcate the similarities, singularities and distinctions of norms, practices and methods, understood and interpreted under the optics From their ends and educational goals.

2 INDICATIONS GIVES CULTURE SCHOOL: STANDARDS, PRACTICES AND METHODS

Which practices, standards and methods were representative gives culture school institutionalized in schools in southeastern Goiás, in first a half of the 20th century?

In the exercise of interpreting the postulates of this question, we adopted as a procedure generator of scientific curiosity the dialogue and the problematization of data obtained in the exhibition documentary of three school institutions, two catholic schools and one agricultural school, located in three cities in southeastern Goiás: Goiandira, Ipameri and Urutai. It was considered as document several records and manuscripts located us collections of institutions what preserved evidence of a school culture materialized in the objectives, intentions, norms and practices prescribed.

THE memory It is power plug in this rehearsal in approach historical of institutions referenced. Therefore, we treat the memory present in the records and evidence preserved in the consulted documents. These, in turn, are clothed in a historical materiality configured in information about institutions, spaces where similarities, distinctions and singularities express themselves under different shapes.

Culture, or rather cultures, in their symbolic, material, theoretical, praxeological, axiological are the substantiation of development and of education through formative and instructional processes. social project, the education is a personal construction; is a subject-centered process that tend The to assume The modality in project, whose representation in future mediates between an idealization and the educational reality, in its complexity and present. Constituting itself a structured epistemological update in social and power relations, are part of the very theory of these relationships and their change in education, action and innovation tend to The overlap, coinciding in their agents, times, objectives and results. (MAGALHAES, 2004, p. 15).

As far as institutional memory is concerned, this concept, originally derived from the organization such as It is designed at the field gives management, still lacks in larger depth and verticalization for to
be best applied and understood at the field gives education. However, this conceptual density tends to be reached, as a result of research that are dedicated to the study and characterization of this object; in particular investigations linked to the Law Suit in schooling institutionalized, this It is, one education Formated and organized in a specific space and time, with the aim of promoting teaching in many different levels and modalities.

The theoretical analysis demonstrated and based on the authors who dialogue with the field of school culture and with the history of school institutions and the Brazilian and Goiás context gives first a half of the 20th century.

THE education It is a construct human constituted per changes, training processes and pathways in terms of knowledge, skills (techniques), behaviors and values, practices and attitudes; It is a rational and reasoned process/product – an epistemic process, by a gradual search for knowledge, for communication, but also for a hermeneutics, an inquiry and a “construction” of meaning – thinking, say, do/build; process in becoming, it is interaction of elements human, social, procedural (material and organizational), cultural. (MAGALHAES, 2004, p. 32)

In the schools catholic, had up The worry in to distribute you courses in shifts (sessions) in two days. In Franciscan schools, faced with the demand for places, a third shift nocturnal, would be available. To predict O operation in shifts distinct, would solve the problem of dividing students, as there were also demands for age and level of education – adolescents at an advanced age needed to be literate; per other side, the adults who, due to day work could only to attend The school at night –, would be some of situations what needed in settings and adjustments.

In the political alignment of the context called the “Era Vargas”, situated In the 1930s, he propagated nationwide a vision of progress and development oriented per Principles hygienists, Sanitary, with alignment in standards in order and civility urban; Software in occupation of the territory with the installation of agricultural colonies in various regions of the country, including states in the Midwest. The equipment of States also absorbed part of the religious expansion of the Catholic Church, by making the offer of religious education in public institutions official, despite the rule of the republican secular state. The conservative face of modernization would probably not be limited to the domains religious, conserve, also, some correspondents immersed at society civil identified with similar ordinances ethical and morals. (ALMEIDA CLAYS; FISH, 2020, p. 223).

At the Nossa Senhora Aparecida School, the Missionaries of Jesus crucified dealt with challenges look alike, arriving The Open The school in many different schedules in operation to meet specific clientele and courses. In both cases something common was the existence of different courses operating in the same building or separated by a pavement as form in shelter different activities for students in different ages and phases.

Through the action of the Missionaries of Jesus Crucified, the institution would shape the morals, modesty and customs of girls of good family, as attested by the prescriptions and internal procedures:

watch well at students O model of uniform and is This one ever preserved and in order, with the length determined by the regulation and no second at circumstances gives fashion
what varies without cease. All at skirts should cover the knees for small pupils. must go down fourfingers below the knees for older students. Up to 12 years old can use socks short. (Report of Gymnasium of school Our Madam aparecida – December 1947, p. 7)

The posture to be observed by the students in the school environment, marked by silence and rules rigid, also included aspects disciplinary as

In hour in classes, during The explanation From teachers, arguments or written works, the silence must be perfect and respectful: do not speak of his colleague, insisting still on the silence of action: not stepping hard, not drag your feet, open wallets, drop objects, be fidgeting, ask unnecessary licenses, etc. THE student wait Respectfully what him for said or advised, no interrupt with explanations and impolite answers. finding reasons to justify yourself, let some time pass and then look for the person who warned and ask him what Knife O gift in serve her a time. (Report of Gymnasium of school Our Madam aparecida – December from 1947, p. 8)

The control and regulation of internal actions were ensured by subtle mechanisms, used both to reward and to correct and adjust postures. This booklet that every student carried during the school year, it was the badge that allowed them to praise good conduct and to be target in mention honorable to Final of year. in it also if recorded at infractions disciplinary what perhaps occurred with The holder.

Upon enrollment, students will receive a school book. Since Course Primary, The directory demand infuse in the students O sense of greeting of to owe, in mode what, saved you big ones prizes at the closure of year academic, no use at students distinctive nordecorations, your schoolbook being your glory or your point weak, your self-defense or your own accusation. The best gift The end of year you students they can to offer to the their Country It is The same, all completed with you seals monthly in procedure and in studies. (Report of Gymnasium of school Our Madam aparecida – December in 1947, p. 9)

At references at practices show “remains” in methodologies originated in remote times, when subjected to the daily "how to do", they are subject to adaptations and settings, promote changes, acquire new formats and, consequently, they go if consolidating in new practices. In this sense, it would not be a comfortable task to announce the a priori the identity of a teaching method unique, used by parochial schools in Goiás. The character dynamic and "active" of teaching is explained per Valdemarim:

[...] The pedagogical renewal movement that begins to emerge in a half of century XIX, try invest against O character abstract and littleutility gives instruction, prescribing you new method in teaching, new materials, The creation in museums pedagogical, variation in activities, pedagogical excursions, study of the environment, among others. The coverage radius of this movement can also be evaluated by the successive exhibitions universal, organized for the diffusion of renewed pedagogical practices, their materials and your applications: London (1862), Paris (1867), vienna (1873), Philadelphia (1876), which gives rise to the Buisson report), countries that belong to the same mode of production and circulation of goods, although with results and diverse skills. You materials didactic widespread in this period and in these exhibitions include, in addition to school furniture, boxes for teaching colors andshapes, engravings, collections, various wooden objects, hoops, lines, papers etc. in replacement to old book in texts for be memorized. But, the key to triggering the intended renewal is the adoption of a new method of teaching: concrete, rational and active, denominator teaching fur aspect, lessons in stuff or teaching intuitive (VALDEMARIM, 2004, p.104).

Still about the intuitive method, the same author explain what:
In summary, it can be said that the intuitive method in its claim to be rational concrete and active, is characterized for the attempt in to prescribe you steps methodical for the formation of ideas, regulating with that procedure the senses and the intellect, establishing an equality in purposes between the philosophical method and the teaching method, developing the strategies and means of carrying them out, guided by the characteristics of the school clientele. Knowledge method and teaching method come together in search gives clarity of ideas obtained on one knowledge extensible and generalizable (VALDEMARIM, 2004, p.133).

In organized routines in the classroom, there is a permanent concern in using didactic resources and resorting to different materials that would allow students to observation, manipulation and demonstration of objects and things. In other words, it was need to “materialize” the content taught, make it visible, experience it, because that way done "at children no would forget, learned all". Look what these trace elements point similarities with the principles of the intuitive method. It was necessary to demonstrate and experience with the student situations that help their learning. There is a suspicion that the level demands and demands on the teacher was enormous, because, in addition to organizing the weekly, at activities daily they were inspected in person for the supervisor, before and during the classes.

The need to reproduce the long cultural journey every day, reproducing in school time the time of fabrication, owes to aspects intrinsically pedagogical practices, since learning must be carried out by children and young people for whom the appeal to things has a playful but also disciplining character (VALDEMARIM, 2004, p.176).

Same against gives scarcity in resources, was proposed what The teacher "create" and "invent" O your own material, in wake up with O what go being taught, or be, at As the school curriculum was fulfilled, the teacher would have to produce the resources didactic used in room in classroom.

By recording the annual report of school activities for 1957, in the book of Minutes of the School parish of goiandira indicates:

During the year there were festivities celebrating civic and religious dates. You students gives School parish They took part active at Front desk of DD Archbishop of Goiânia, Dom Fernando Gomes dos Santos and he participated in the closing ceremonies of the year school.
At students gives School parish presented at Radio place several Software. 200 books were purchased for the Library which is open every day schoolchildren. Walls were built to close the courtyard in playground.
Secret Sister Maria de Lourdes, OSF. Dr. Sister M. Celestina, OSF.(BOOK OF MINUTES no. 01 - P. 13 and 14).

In another record in the same source we also find an allusion to the festivities day gives Child.

October 12th - Children's Day our students presented several interesting games. After the games, there was a party in the school hall, celebrating the happy day.
Sister M. Rosalima OSF. century Go. Maria de Lourdes, OSF. (BOOK OF MINUTES no. 01 - p. 19 back).

In these circumstances the teaching methodology depended heavily on the creativity of the teacher. When preparing the classes, it was necessary to organize the practical demonstrations with the resources
natural available in the nearby of convent and gives school. Was O teacher what was in charge of
gathering objects, preparing the tasks and taking them to the students to use in the classroom. classroom.
In some cases, the teacher asked the children to collaborate to gather objects that would be used in practical
math classes, for example. However, when they needed of written material, the sisters themselves gathered
what they had available in the convent and took for The room already what few students had at home some
kind of written material.
The records of the Santa Maria Goretti Parish School show that in the year (1957) a total of 157
students were enrolled in the “Cartilha” 3 class , reaching the end of the year with 88 students – of these 55
passed and 33 failed. In fact, the high demand is confirmed; At the same time, the teaching staff remains
unchanged, with few teachers, including Sisters who divided the attention between the administration of
the School and the living room in classroom.
Reading, writing and calculation were performed every day of the week. the alphabet, the syllables,
the words were exercised with motor coordination and orality activities, all the days. The mathematical
operations were carried out by the students, who manipulated the quantities and establish relationships
before recording sentences. separate, join, classify, compare quantities, everything was done with concrete
material before reaching the abstract record of operations. In the case of reading and writing, the literacy
sister recalled, with a wealth of details that the students exhausted all the possibilities of exercises of
coordination motor While recognized at letters of alphabet, identified syllables andwords. In the absence
of support material, the teacher guided the students to use the desks to practice drawing letters, syllables
and words, they drew in the air, forming the syllables, repeating them aloud and, finally, recording the
activities in the notebook. One curiosity he was The solution per Is it over there found for to supply
The lack in notebooks linedfor the calligraphy task. The teacher assembled on her own chalk board, the
guidelines of the calligraphy. They crossed out the outline of the letter, syllable or model word and guided
the students to do the same in their notebooks. In this way, everyone learned to trace cursive letters on the
regular notebook, no agenda calligraphy.
There is consensus with relationship The existence in practices different

. Some superiors,

although stringent how much The observance gives subject and routine institutional would be "mostopen”,
more democratic in the conduction and organization of the school. Instructed the teachers The cultivate O
dialogue and The responsibility us students. Others they were most energetic and admitted the application
of disciplinary measures to students who did not conform to the standards gives school.
azzi & Klaus explain what
Civility was promoted on a large scale by the government, especially the leave From years
old 1930, and you colleges Catholics joined fully at government instructions. The
celebration of patriotic dates was highlighted, with emphasis for The death in straps (21 of
april), independence (7 of September), Proclamation of the Republic ( October 15 ), and
Flag Day (November 19th). In these ceremonies there was the raising of the flag, singingof
the National Anthem, formation students' military, civic-literary sessions, with speeches,
poetry and patriotic songs. On some occasions, as in week gives homeland, parade through
streets of the city (AZZI; KLAUS, 2008, P. 302).

Principles and Concepts for development in nowadays society - Indications of school culture in southeast goiano:
practices, standards and methods

1584


In the Church's liturgical calendar, the school was mobilized to organize ceremonies such as the coronation of Our Lady, other special festivals such as the patron saint of the school, the parish of the city, party of San Francisco, Easter, Christmas, among others.

In commemoration of the Independence of Brazil, there was a party in the School parish Santa Maria Goretti in day 7th of September in 1953. After the 7 o'clock Mass the students started the program with a prayer and the national anthem. Then 6 girls from the Cartilha recited a poem, "My Brazil". Representing the 1st Year, five girls sang a song patriotic of Brazil. The girls Aparecida Moreira, Wanda Telles and Roseli 2nd Year Saints sang the anthem of the Flag. The 3rd year presented a scene historical. Aricilda Mariano of 4th year recited a poem "7 in September". A patriotic reading was given by student Paulo Diniz do Admission Course and the student Zilah de Fátima from the Course also from the Admission gave a speech. Program numbers were interspersed with corners. The vicar, Frei Domingos Foley, ended the session with a speech. Present for this party were the students' parents. 09/7/1953. Secret Sister Maria assumes Wedge; Dir. Sister M. Celestina frustrate (BOOK IN MINUTES no. 1, 1953, p. 8 verse and 9).

Artistic expression, music, poetry and paintings were also explored by the sisters in these activities. Public exhibitions were often organized at the school in which parents were invited to visit and get to know the students' productions. This kind of activity was a routine at school.

The Santa Maria Goretti Parish School activated the city's social life through its celebrations and ceremonial. THE presence in civilians and in authority ecclesiastical does part gives projection and importance assigned. The activities gives School.

On November 30, 1957, it took place in the main hall of the Escola Paroquial Santa Maria Goretti the ceremony for the delivery of diplomas to the graduating from the 4th year of primary. It began with Holy Mass at 6.15 inAction in thanks fur terminus of Course. In then he was offered acoffee to the students and your worthy parents. The following guests of honor were present: Dom Fernando Gomes From saints, DD Archbishop in Goiania; Frei Stephen Walsh, OFM, vicar gives parish, Frei Celestine O'Callaghan, OFM, at teachers of the Establishment and the parents of the students. after a speech read by the student Júlia Aparecida Borges, Mr. Archbishop Dom Fernando handed over the diplomas and honored the students with a few words of congratulations. The session ended with a prayer. (BOOK OF ATA no. 01, 1957, p. 13 and 14).

By cultivating civics, patriotism and religiosity through school activities, it was possible associate to education, sociability and evangelization at the space from school parish. In the experiences locations, the solemnities were marked by prayers and hymns.

A distinct school culture, although the interfaces with other institutions are maintained he was inscribed at School Agricultural Federal in Urutai. Created at decade in 1950, subsidized of this the beginning with resources from the federal government, had as main mark the offer of the course of Agricultural Initiation in the first two years (1957-1959) and in the third year the Agricultural Master course, which took place 7 years later in 1964 after the educational institution move from Agricultural School to Gym Agricultural, thus the institution offered the course in Initiation Agricultural and Mastery Agricultural what was a course at the which you students study technical and propaedeutic disciplines. In the Scrapbook of the Official Gazette it was prescribed the subjects of the Agricultural Initiation course, note:
Of course in Agricultural Initiation

Art. 1. The subjects of general culture of the Agricultural Initiation course are the following:
1. Portuguese
2. Math
3. French
4. Sciences natural
5. Geography (General and of Brazil)
6. History (General and of Brazil)

Art. 2. The disciplines of technical culture of the Agricultural Initiation course are the following:
1. Agriculture
2. Creation in animals domestic
3. Drawing Technician

Art. 3. At subjects constitutive of course in Initiation Agricultural will have the following seriation:

The students who completed the agricultural initiation course received the certificate of Operário Agrícola and the students who finished the course of agricultural mastery, the diploma of teacher agricultural.

With the opening of the Agricultural Gymnasium in Rio Verde, the director of the Agricultural Gymnasium de Urutaí Júlio Brandão de Albuquerque (Dr. Júlio), transfers employees and students to this municipality 380 kilometers away from Urutaí. Faced with this situation, the educational institution will only offer courses agricultural practices, such as the Tractor Plow and Rural Labor Qualification aimed at quickly training professionals to act in different activities and services in rural areas, being constituted, composed by circumstances historical specific in your era, among which we highlight you courses offered imbricated by local, regional and national socio-political-economic issues in emphasis in the sector agricultural and livestock in the decade in 50 and 60's of the 20th century.

When characterizing the subjects of the courses offered, it was found that theory and practice had status equivalents us courses and trainings. You teachers explained O contents in theory and in practice, students needed to acquire skills to perform well in the agricultural activities, with a focus on know-how. The institution had a complex and wide structure, place organized for to develop The culture school agricultural "O space school has to be analyzed as a cultural construct that expresses and reflects, in addition to its materiality certain discourses” (ESCOLANO, 1998 p. 26) the institution aimed to to create opportunities for educational practices in different spaces such as the zootecnical center, orchard, aviary, vegetable gardens, machines agricultural. These many different installations what made it possible The part practice they were calls in Laboratory in Practice in Production. THE manner as if developed training courses for agricultural work, corresponded to the application practice in all spaces and curricular components.
3 CONCLUSIONS

When considering the points of similarities in the institutions surveyed, what is in mode most evident is the standardization in postures, the ritualization in practices, the definition of routines and the rationalization of the time dedicated to teaching in the form of calendars and timetables previously defined and observed by the different subjects.

The uniformed postures have in common the observance of certain standards of behavior, regulated for coexistence in the institutional space. Definitions like the type of material that students should carry, the use of uniform or uniform for each activity performed internally, the permitted or inappropriate modes, gestures and expressions illustrate the framing of bodies and minds in school environment.

Regarding the ritualization of practices, obedience and recognition of authority of the teacher and other professionals at the service of the school. What is permitted or prohibited, that one what it is liable in reprimands and sanctions present criteria similar, then point out signs of the way the school organizes itself to domesticate the subjects and inscribe one new civility. The distribution in tasks, the definition in functions express the hierarchy of activities, so that the internal experience can be assimilated by the different participants. Both teachers and students are shaped by the school culture of schools Catholics and gives agricultural school federal.

Another verified similarity concerns the pedagogical methods for the introduction of theoretical content. In the records and manuscripts there are indications of teaching rituals that approach with regard to the transfer of knowledge. The use of school supplies by the student, reveals the worry with the provision of conditions general for what teaching and the learning happen. You papers, at obligations and duties in students and teachers are included in prescribing procedures.

The rationalization of time confirms the aims and objectives of schooling, insofar as in which they shape behaviors and postures in the school space. Attendance, punctuality, frequency, subject, cordiality, respect are indicative of civility experienced internally. Mechanisms in control and regulation are used for to accompany you individual and collective performances. Thus, in fulfilling its role as a training agency, the school inculcates in the student new ways and social behaviors expected of someone who undergoes an educational process. That is, in addition to the final result demonstrated by the domain From knowledge and skills acquired, The school also lays down new standards of civility and behavior, taken as needed for The society gives era.

ABSTRACT
The teachers of the Department of Education in Community Nursing of the Faculty of Nursing of the
Benemérita Autonomous University of Puebla, Mexico and of the Community Centers of Attention to Life Care (CECACVI - BUAP), in the development of the program "Care of the sexual and reproductive health of university students "(CUSASEX, 2012), implemented since 2006 in schools of various educational levels, the Faculty of Nursing and the university itself, identified sexual and reproductive knowledge, behaviors and practices in students of a public preparatory school, to have a diagnosis that will guide the preventive interventions to be carried out in the "Take care of your health" day. The study was descriptive, correlational, cross-sectional, carried out in 318 students selected at random. Of the surveyed population, 35.9% have an active sexual life (VSA), 21.6% started it between 12 and 13 years of age and 78.4% between 14 and 17 years of age. Of those who have VSA, only 40.8% use a condom, although 87.0% reported having received information about this means of protection from their parents at home and health professionals at school. There was no relationship between age and gender with the practice of safe and protected sex (r = .213, p = .187; r = 0.50, p = .758), but with having received information (r = .362, p = .022). The results obtained showed a high exposure to the risk of sexually transmitted diseases and unwanted pregnancies on the part of the students, for which interventions were implemented aimed at limiting the risk, strengthening safe and protected sex, and the co-responsibility of the students in the health care and the LGAC of the Academic Body of Community Nursing called "Community Care: From the Nursing Perspective".

Keywords: institutions, school children, standards, practices, methods, culture school.
1 INTRODUCTION

Adolescence and youth are stages that are characterized by the energy, vigor and freshness of the individuals. Although these are relatively healthy age groups, they are stages that exposed to multiple risk factors in the exercise of their sexuality. The lack of information and sexual education on preventive measures, safe and protected sex, contraceptive methods, condom use and placement, sexually transmitted infections, and unwanted pregnancy to the development of inappropriate behaviors and practices, conflict in gender identity, acquisition of habits harmful, interaction with multiple couples sexual Y a taking of inadequate decisions regarding their sexual health, compromising their present and future well-being (Organization Pan American of the Health, 2008).

For the World Health Organization (WHO), 2006/2010, the Health sexual and reproductive (SRH) is the state of complete physical, mental and social well-being and not merely the absence of disease in all matters relating the reproductive system and its functions and processes; component essential of the ability of the individuals for turn in people balanced, responsible Y productive within of the society, law that It includes the benefit of the security and integrity sexual, the identity of gender, the expression Y exercise of the safe sexuality, privacy, equality, expression of love and access to attention of the Health.

Guaranteeing the sexual and reproductive health and rights of adolescents and young people is essential to ensure that they lead healthier lives. So take care of the SSR must occur throughout the entire human life cycle and in all contexts: family, institutions educational and health, with the purpose of promoting good decision-making in the exercise sexuality and reproduction, limit sexually transmitted infections, pregnancies not desired and truncated life projects. Aspects that should be the central concern of the programs and professionals of the Health (Bernstein Y hansen, 2006; Lerma et to the, 2009).

In Mexico, in the year 2012, the results of the Poll National of Health Y Nutrition (ENSANUT) (Gutiérrez, Rivera et al, 2012) reported that 23% of adolescents (of a total of 22,804,083 million; 50.3% men and 49.7% women) had an active sexual life, 14.7% of the men and 33.4% of women did not use any protection method in the first intercourse However, at the time of the survey, 80.6% said they used a condom when they have sexual intercourse and 6.2% of women take hormones, specifically the second day pill Of the women between the ages of 12 and 19, half (51.9%) reported having been pregnant and 10.7% were pregnant at the time of the interview. In this same year the National Institute of Statistics and Geography (INEGI, 2012) reported that the main infections of transmission sexual reported by the institutions of Health in adolescents and young people were urogenital candidiasis and human papillomavirus (HPV), and Mexican Social Security Institute (IMSS) that 32% of the population affected by HIV/AIDS have less of 25 years, and the vast majority I know infected between the fifteen and 18 years of age.
Regarding the university students from Puebla, the aforementioned reality is not different, the affections, projects, emotions, habits and fantasies that are part of your life during your professional training, cause some to start their sexually active life at an early age and others the continue, the relationship of partner occupies a place fundamental in their interests everyday, they star in courtships or fortuitous love relationships, along with their professional desires, without However, unplanned maternity or paternity and sexually transmitted infections are a latent risk in them Y are usually associated a projects of life truncated.

Ospina and Manrique (2007), when studying the SSR in 764 university students, found that the 67.6% recognize the existence of others preferences sexual, the 90.3% rated his education sexual as adequate, 36.2% considered having absolute certainty of avoiding an unintended pregnancy wanted, the 66.2% considered necessary increase knowledge on sexuality forfeel insurance, the 1.5% have couples sexual of same sex, the 8.3% it is bisexual; the average age of beginning of active sexual life was 16.5 years, the average of partners sexual was 3.96 in men and 2 in women. Likewise, Chávez, Petrzelová and Zapata (2009), reported that of 719 Mexican university students who participated in their study on SRH, 70% received sexual education from the family about STIs and methods contraceptives, the 60% knew the use of preservative, the 51% opined that the relations Come in homosexuals are abnormal, the 13% said that the homosexuals are sick Y the 41% He stated that he had started an active sexual life between the ages of 18 and 21. On the other hand Lema et al 9 They found that the 70.7% of 587 students university students were heterosexuals, the 5.2% homosexuals, the 33.6% query journals, videos either pages pornographic Y the 8.3% have virtual sex. Finally González et al (2013), when studying SRH in students university students in a Cuban community found that of 126 young people who declared having had sexual intercourse 86.6% did not use any method of family planning in their first intercourse; 13.4% did, and they selected condoms, birth control pills, and intercourse interrupts.

In this context, the present study was given from the implementation of the "Care Sexual and Reproductive Health of University Students" (CUSASEX) (García, García M, 2013), where the teachers of the Department of Education in Community Nursing of the Faculty of Nursing of the Meritorious Autonomous University of Puebla, Mexico, carried out a diagnosis previous on the problematic plus common that compromise the Health of the high school students. The objective was to assess knowledge, behaviors and practices sexual and reproductive health of students in such a way that preventive interventions to implement in the working day "Takes care your Health" were assertive Y will strengthen the Program “CUSASEX”. Program that since 2006 has been implemented year after year as a strategy of prevention positive in the students of the schools secondary Y telesecundaria of the Community Center (CECACVI-BUAP) of San Andrés Azumiatla, in the Faculty of Nursing, in high schools and other Academic Units of the BUAP and in institutions.
government of the city of Puebla (House of the Youth Y schools high schools Y high schools of the Secretary of Education public of the city of Atlixco Y Puebla, Mexico) in in which health professionals from other institutions such as the Ministry of Health of the State of Puebla, especially the Ambulatory Center for the Prevention and Care of AIDS and Sexually Transmitted Infections (CAPASITS), the Mexican Institute of Social Security (First Level of Care), the University Hospital and the Faculty of Psychology of the BUAP, among others. Y whose actions strengthen to the Academic body of Nursing Community.

2 METHODOLOGY

The study it was descriptive, correlational, cross, done in 318 students of level randomly selected high school students to whom an instrument was applied in their classroom of 36 questions on sexual and reproductive health with a Crombach's alpha of .94, after information on the purpose of the study and information management. In the application of instruments participated by teachers from the Department of Nursing Education community who maintained the individuality and security of the interviewees and preserved respect for their dignity and well-being as established by the Regulations of the General Health Law in Research Matter (Ministry of Health, 1984/2013). For capturing and analyzing data was used the statistical package SPSS (Statiscal Package for the Social Sciences) version 19.0, as well as descriptive, variability and parametric statistics according to the curve of normality of the data.

3 RESULTS

Of the surveyed population, the average age was 17 years, 54.2% were women and the 45.8% men, 83.7% were single, 87.0% received information on aspects related to SRH, in its highest percentage by health professionals at school and parents at home (table 1/ graph 1), 65.7% stated that the information received was timely, truthful Y enough, the 30.1% that it was timely Y truthful but insufficient Y the 3.3% insufficient and inadequate.

Table 1. received information Y education on Health sex and reproductive

int. ESSR. Puebla, Mexico, 2012. 318 students
91.5% know what the risk factors are, which is a sexually transmitted infection, for what is the use of the condom and what is the correct technique of its placement. The 90.2 is identified with its gender (male - female), 35.9% have an active sexual life (VSA), 21.6% the start of the 12 to 13 years old and 78.4% between 14 and 17 years old, 40.8% with VSA practices sex safe and secure, 92.4% have only one sexual partner, 6.9% of women have become pregnant in an unplanned way. There was no relationship between age and gender with the practice of safe sex and protected (r = .213, p = .187; r = 0.50, p = .758), but Yes with to have received information (r = .362, p=.022).

4 DISCUSSION

The implementation of health programs aimed at education and prevention of health problems of Health sexual Y reproductive What the Program “CUSASEX” in the students of level high school, results in them assuming better decision-making and greater responsibility the exercise from his sexuality and of their behaviors Y practices sexual.
The data obtained in the study, in a general way coincide with those obtained in other schools and faculties where the program has been implemented, show a development of low-risk sexual behaviors and practices. The age of onset of VSA coincides with what reported by the Institute National of Statistics Y Geography in studies made in adolescents, as well as in the National Nutrition Survey and Ospina and Manrique, however, differ with those of Chávez, Petzelová and Zapata who found that the age of onset was 18 to 21 years old, that is, at an older age. Regarding the information and education received the results show similarities with those published by Chávez, Petzelová and Zapata who inform that a tall percentage of teenagers manifested to have a education sexual adequate and having received information on various SRH topics, especially on the use of condom. No agree with the information reported by Ospina Y Manrique in where the students considered need to increase knowledge about sexuality To feel plus insurance. The results obtained evidenced a high exposition to the risk of sexually transmitted diseases and unwanted pregnancies on the part of the students, so interventions were implemented aimed at limiting risk, strengthening safe sex and protected, the co-responsibility of the students in the watch out of its Health sexual Y reproductive.

Finally, the school as a mediating institution between the social and individual dimensions seeks guarantee a comprehensive education in students and limit any risk factor to health that truncate the projects of life of the same.

ABSTRACT

The main objective of this work was to propose a model of actions and steps helping managers and organizations in sustainable decision making and better managerial and commercial competitiveness. For this, a bibliometric research was carried out in the database Periódico Capes (2021), and no scientific or academic works were found with a proposal to relate both themes in the study of marketing or commercial management. The theoretical contribution of the work was to bring an updated literature to support the interface between the proposed themes, in addition to describing the theoretical relationship between the marketing plan and the business model. The Canvas model is a tool that allows planning and analyzing organizational resources and has facilities such as visual exposure, simplicity, global approach, among others. And a marketing plan involves communication in an action designed by partners and investors to be directed to other internal and external stakeholders, such as internal managers, employees, business partners, and in some cases, current and prospective customers. The practical contribution of the work was to elaborate and describe a consolidated and self-applicable model in the organizational environment based on marketing and commercial elements present in the organization. The main conclusion was that the model still seems incipient, needing more support, application and validation for its widespread use.

Keywords: Marketing Plan, Business model, Business Model Canvas.

1 INTRODUCTION

Digital customer service and the ability to engage customers in the technological context, in general, does not meet consumers’ expectations (Beeler, Zablah, & Rapp, 2022). The current understandings about marketing show that sending the right message, at a more propitious moment, allows the generation of an adequate value proposition for a target audience, and, meets customer expectations (Villanova et al., 2021). And this thinking, above all, should permeate the way companies create, advertise and sell their products and services, according to the needs of their customers (Kotler & Keller, 2019). In a competitive and connected world (Calvosa & Franco, 2022), the consumer has more access to information and choice.
opportunities (Ferreira & Nascimento, 2020), however, in external influences (Fernandes, Ferreira, & Calvosa, 2021), which may represent opportunities, but also challenges. And these may be relevant metrics for decision making about customers' intentionalities and potentialities, since it has been found that there is no social independence in their consumption influences (Argan, Argan, Aydınoğlu, & Özer, 2022).

To face the competition, the way the organization positions itself and develops its marketing actions may indicate a path for its growth. Managing marketing processes involves establishing commercial goals for an organization. That is: to plan, implement and control strategies that may, by a sequence of attitudes, analyses and decisions, allow the company to achieve and sustain superior results, by communicating value, attracting its target audience, stimulating consumption and maintaining in a stable way the economic and psychological relationships of this audience with the organization (Calvosa, 2010). To this end, a competitive organization should make these intentions explicit through the Marketing Plan tool, a document that provides foundation, support and guidance to the actions and marketing strategies, the proper instruction and anticipation of value communication to the internal and external public to the organization (Peter & Churchill Jr, 2012). Especially in a technological scenario and that aims fast relationships, digital and with the use of innovative technologies (Ferreira et al., 2021).

Although there are several marketing plan models, such as: complete plan, basic plan, historical plan and plan for new products/services (Kotler & Keller, 2019), all have as didactic convergence the characteristic of generating contribution to various audiences, defining strategies, reshaping the way products and services are offered, promoting synergy with the proposed business model, among other functions that may be decisive for the success or failure of the business. These functions and decisions affect the organization's positioning from internal ideas and conceptions to the 'end of the decision chain', with the interface of external agents (Galvão et al., 2016). For the company's performance to increase in potential success, the marketing plan should be in line with a defined business model, converging on the intended goals and propositions. An organization is a complex environment, with variables, influences and interests that act in the "inside-out" direction, while others, in the "outside-in" direction (Calvosa & Ferreira, 2021).

The marketing plan, as a managerial tool, is a structured document prepared by the organization itself, which aims to reach certain stakeholders, that is, a kind of communication from partners and investors to other agents that will help the business happen. On the other hand, in organizations it is common to establish another kind of communication that will develop guidelines, strategies, and a sequence of understandings of how the business should be organized, called business model, as better explored in other parts of this work. The composition of a business model is about the coherence of the company's strategic choices. And this structure should generate value at the operational, tactical, and strategic levels (Nielsen & Lund, 2012), as well as for other stakeholders. A business model will aim to strengthen the links between the parts and sectors that make up a company to create competitive advantage. Among the most used business models in competitive organizations, the Business Model Canvas tool (Osterwalder & Pigneur,
2003) proved to be especially developed to aid visual structuring, to facilitate understanding and application, presenting itself as practical, flexible, and dynamic for different sizes, natures, and business orientations (Silva et al., 2021; Sampaio Neto et al., 2021), which allows, when correctly applied, to present facility for decision making and explicitness of the strategy to be adopted (Osterwalder & Pigneur, 2010).

Is it possible, in the organizational environment, to present a managerial decision making based on the joint analysis of the marketing plan and business plan tools, starting from the premise that they involve the structuring of a complex strategy? In organizational applications, these decisions are usually focused on the analysis of partners and investors, with the perception of a multifocal vision, encompassing concerns with internal and external impacts at the same time. This was the research question that permeated the preparation of this work.

In bibliometric research carried out in the Capes Periodical database (2021), no scientific or academic work was found with the proposal of relating both themes present in the study of marketing or commercial management, which showed a theoretical relationship between some type of marketing plan and the Canvas business model, a fact that points to the originality of the subject. But also, and of great interest to this research, it brings the academic and organizational publics closer together (Batista et al., 2009). The relationship between the themes may interest interdisciplinary audiences, such as organizational managers, undergraduate and graduate students, in the academic environment. Also, to managers and decision makers in the initial parts of the supply chain, in the applied organizational environment. Thus, pointing out the relevance of the subject.

Thus, the objective of this work was to propose a framework containing a sequence of actions that can be used to assist managers and organizations in making sustainable decisions and improving their managerial and commercial performance. It was built from, and according to, the analysis of bibliographic research, meta-analysis, and a didactic opportunity detected in the absence of literature.

2 THEORETICAL FRAMEWORK

The literature review and secondary research pointed out that, among the most commonly used tools for the application of business models, the Canvas proved to be simple, effective and able to stimulate the creation of visual thinking when combined with the marketing plan tool, as pointed out by Raasch and Scholz (2020). Canvas has been used successfully to guide and generate value in human-technology integration, as well as to structure methodological proposals and strategically support management actions (Moenck, Roth, Bohné, Romero, & Stahre, 2021).

2.1 MARKETING PLAN

For Hughes, Hodgkinson, Morgan, Hughes and Hughes (2020), the marketing plan should be a reliable instrument, capable of transmitting dynamic capabilities, efficiency, market planning and strategic positioning. As a marketing tool, its organizational use presents itself as an explicit document, with the
purpose of communicating to a group, an organizational intentionality. It is an instrument that directs and coordinates marketing efforts toward a given goal, in order to inform, convince, or influence other stakeholders. A marketing plan establishes target markets and a value proposition to be offered based on an analysis of the best market opportunities (Kotler & Keller, 2019). The audience of the marketing plan is primarily internal, but it can also be read by people outside the organization. Within the company, it will be used to direct the employees directly involved, coordinate it with the work of other departments, be accountable to top management, and to convince management to provide the resources needed to execute the plan (Calvosa, 2010). To effectively guide implementation, each part of the plan should be described in detail. Table 1 shows the sections usually contained in a marketing plan:

<table>
<thead>
<tr>
<th>Table 1. Sections of a Marketing Plan</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Executive Summary and Table of Contents</strong></td>
</tr>
<tr>
<td><strong>Situation Analysis</strong></td>
</tr>
<tr>
<td><strong>Marketing Strategy</strong></td>
</tr>
<tr>
<td><strong>Financial Projections</strong></td>
</tr>
<tr>
<td><strong>Control</strong></td>
</tr>
</tbody>
</table>

For the composition and achievement of the expected results, a marketing plan, some key questions should be asked: (i) Is the plan simple? Does it communicate its content easily and practically? (ii) Are its objectives concrete and measurable? Does it include specific actions and activities, each with completion dates, responsible persons, and determined budgets? There should be clarity, realism and completeness in the plan, so you should also ask; (iii) Are the sales targets, expense forecasts and deadlines realistic? Has a frank and honest self-criticism been made to raise possible problems and objections? (iv) Does the plan include all the necessary elements? Does it have the right breadth and depth? (Berry; Wilson, 2000). And finally, (v) Can it generate value for the organization, without "plastering" the existing strategy? (vi) Is it consistent with a projected profitability proposition? (Hughes et al., 2020).

In the organizational environment, the complete marketing plan has been applied with great recurrence by managers and entrepreneurs, for communicating more broadly the marketing strategies to stakeholders near and far from the company (Kotler & Keller, 2019). Therefore, it was selected by the authors to be part of the theoretical model proposition to achieve the research objective. Figure 1 presents
a marketing plan of the complete type in a detailed way.

Under the strategic perspective, for Cohen (1991), the marketing plan must act as a roadmap and communicate to management how to get out of a starting point of the plan and achieve the objectives; It must assist in the control and monitoring of the strategy implementation management; In addition, it must be able to inform all participants their roles and functions, since they describe the use of resources of all kinds; The marketing plan, stimulates the “thinking” making the organization to use efficiently and effectively the available resources. And finally, the marketing cloth should enable the creation of a sustainable competitive advantage.

However, before starting a marketing plan, it is up to the organization to know the factors, whether internal or external, that have some kind of influence on the context in which it operates. Another important aspect related to this issue is to know how your product/service is doing in the market and what your real internal competencies are. With this set of information, it is believed that the marketing plan will be able to generate consistent results in the medium and long term.

Figure 1: Composition of a Complete Marketing Plan

This tool can be a support for decisions that will define the future of the company. The complete marketing plan aims to structure in a detailed way each component that can influence the business. The document starts with a deep market analysis, knowing the needs, trends, and demographics; after all, if the product/service does not fit the consumer market, future steps will be useless. In the development of the plan, the marketing mix and marketing strategies are defined. And the way the business will act in the market, channels, promotion, price, each of these elements can be used to communicate to stakeholders the proposal that the product/service offers positioning itself in the market (Calvosa, 2010).

Among the advantages, this tool identifies the opportunities that can generate good results for the organization, showing how to penetrate successfully to obtain the desired positions in the markets, by establishing objectives, goals and strategies of the marketing mix in line with the overall strategic plan of the company. For Skacel (2005), the practical gains for the organization in using a marketing plan are: establishing specific objectives to be pursued, providing means to measure progress, providing for corrective actions in case of variations, and pursuing profitability. Writing a marketing plan provokes the team to reflect and be proactive. The various levels of the organization work together to avoid conflicts and omissions. Each sector contributes to the creation of a general strategy, complete and coherent with the business objectives. Another concern should be that the instrument allows the organization to follow the social demands and the necessary changes in the ways of thinking and wanting to consume, which are going through a social and digital revolution (Calvosa, Carvalho, Lima, & Januário, 2020).

An organization is a set of subsystems, therefore, the marketing plan must be aligned with strategic planning and the other areas for it to function effectively. Without the appropriate level of organizational support and resources from the entire set, no marketing plan can aim for success (Kotler & Keller, 2019). The success of the marketing plan depends on the ability to apply marketing theories and their frameworks to the specific problem that the organization deals with (Chemev, 2020). And being able to adapt the entrepreneurial initiative to a management and business-oriented model that is applied to diverse organizational realities (Leite, Krakauer, & Calvosa, 2020).

2.2 BUSINESS MODEL

Slywotzky (1996) explains that a business plan (or model) is the way a company (i) selects its customers, (ii) defines and differentiates its products and/or services, (iii) establishes which tasks it should undertake and which it will outsource, (iv) configures its resources, (v) interacts with the market, (vi) offers new products and/or services, and (vii) makes a profit. The business model reflects a process of figuring out what value to create and how to profitably deliver it to customers. And these activities involve entrepreneurs and stakeholders jointly to configure a value cycle (Meirelles, 2019). There are several types of business models, each according to a particular business or organizational proposition. Some examples of business models are: B2B (business to business) - company to company interface; B2B2C (business to business to consumer) - company to consumer interface, but with another company intermediating the
relationship, such as marketplaces; among others, models that implicitly or explicitly address the internal competencies that underlie a company's competitive advantage (Barney et al., 2001).

With so many options available, when analyzing the recent literature on the subject, Raasch and Scholz (2020) indicate that the Canvas is a business model that can easily instrumentalize and guide various activities in different types of businesses. For, it allows the systematization of project information from conception, implementation, and monitoring, in order to apply design tools to model business plans and organize actions. Also, it is a business building model conducive to practical application (Silva et al., 2021). Sampaio Neto and collaborators (2021) complement that this model is a tool that allows planning, creating or reformulating some company, thus contributing to make it more innovative or able to compete.

The marketing plan is a document that establishes the scopes of an organization, referring to a next period of actions and determines action programs necessary for the completion of these scopes (Toledo, Perrotta, & Petraglia, 2007). Thus, the marketing plan has as function not only to be a facilitator in the day to day of executives, but also to offer a valuable contribution to the marketing strategy of an organization, identifying promising opportunities and thus outlining how to conquer and maintain positions in identified markets (Toledo et al., 2007).

2.3 BUSINESS MODEL CANVAS

The Canvas tool has stood out in usability and usefulness for structuring business models. For being simple, practical, dynamic, easy to assimilate, and applicable in various types of companies of different natures, sizes, and time in the market, this solution contributes and helps businesses to structure operations and key elements of their proposal. This model, graphically represented in Figure 2, can be understood as a dynamic tool for identifying opportunities and creating business models, with simple language that allows one to describe, manipulate, understand, and transmit ideas through a summary table (Almeida et al. 2020).

The Business Model Canvas (BMC), Business Model Framework, or simply, Canvas is presented in small blocks of key elements for the company that, when filled, show if a particular idea makes sense from the financial point of view, thus projecting the performance of products and services if they were launched on the market (Osterwalder & Pigneur, 2010). Recent studies point out that the adoption of this tool can help managers focus on the value proposition to be offered to their customer segment, thus improving the understanding and communication of investors and partners in relation to stakeholders (Sort; Nielsen, 2018). Canvas was developed aiming to make the business model concept easy to operate, realize, create and maintain value from the key points of the business itself, with a holistic and flexible view (Osterwalder & Pigneur, 2003). It does not require great expertise to be used or read, which facilitates its diffusion within the organizational environment, besides being adjustable to small and medium businesses (Osterwalder & Pigneur, 2010).

The tool stimulates the determination of the basic elements of a business model, intuitively addressing the "what?", "who?", "how?" and "why?" of any business existence. The value proposition
specification determines "what?" should be delivered to each customer segment. The "who?" is determined by specifying the channels and customer segments to be served. Specifying the cost structure and potential revenue sources elucidates the "why?"; determining the resources, key activities, and the strategic partnerships indicates "how?" the strategy will be executed (Oyedele, 2016).

The Canvas model can be presented and used on a printed poster board, and the ideas built by means of small sticky papers glued on the poster, in which several groups of people can draft and discuss together their elements, thus emerging several "sketches" of business models. The blocks positioned on the right side represent the emotional and value side for an organization or business, making analogy to the right side of the brain that represents emotion. The blocks on the left side represent efficiency, making analogy to logic (Osterwalder & Pigneur, 2010).
An overview of its elements is given in Table 2:

<table>
<thead>
<tr>
<th>Table 2. Elements of the Canvas</th>
</tr>
</thead>
<tbody>
<tr>
<td>(i) Value Proposition</td>
</tr>
<tr>
<td>Package of products and services that create value for a specific Customer Segment. It is the reason why customers choose one company or another. Solves a problem or satisfies a need of the consumer of a specific Customer Segment.</td>
</tr>
<tr>
<td>Segments Market</td>
</tr>
<tr>
<td>It defines the different groups a company seeks to reach and serve. And which ones it should ignore. They represent different segments if their needs require and justify a different offering, or if they are reached by different distribution channels, for example.</td>
</tr>
<tr>
<td>Channels</td>
</tr>
<tr>
<td>It is the company's interface with customers, playing an important role in their overall experience. It describes how a company communicates and reaches out to its Customer Segments to deliver a Value Proposition.</td>
</tr>
<tr>
<td>Customer Relationship</td>
</tr>
<tr>
<td>Describes the types of relationships that a company establishes, can range from personal to automated and be driven by motivations such as: customer acquisition/retention, and/or sales expansion. It deeply influences the customer's overall experience</td>
</tr>
<tr>
<td>Key Resources</td>
</tr>
<tr>
<td>The most important resources that enable a company to create and deliver its Value Proposition, reach markets, maintain relationships with Customer Segments, and earn revenues. They can be physical, financial, intellectual or human, owned or leased.</td>
</tr>
<tr>
<td>Key Activities</td>
</tr>
<tr>
<td>The most important actions a company must take to operate successfully.</td>
</tr>
<tr>
<td>Key Partnerships</td>
</tr>
<tr>
<td>Describes the network of suppliers and the main partners that make up the business and make its execution possible. Alliances optimize operations, reduce risks, and are allies in the development of new products, among others.</td>
</tr>
<tr>
<td>Sources of Revenue</td>
</tr>
<tr>
<td>Revenue that the company generates from each Customer Segment. How much is each Customer Segment really willing to pay? By answering this question, the company can generate other Revenue Sources for each segment;</td>
</tr>
<tr>
<td>Cost Structure</td>
</tr>
<tr>
<td>Creating and delivering value, maintaining customer relationships, and generating revenue all incur costs, and these must be well described and measured.</td>
</tr>
</tbody>
</table>

Table 2 explains each of the nine building blocks of the Canvas model. They are contained in four macro orientation segments: i) product (Value Proposition); ii) value offer (Customer Segment, Channels and Relationship), iii) infrastructure (Main Resources, Key Activities and Main Partnerships) and iv) financial viability (Cost Structure and Revenue Sources), according to Osterwalder and Pigneur (2010).

Thus, the marketing plan is a plan that is part of the organization's comprehensive strategic plan, since it is aimed at a greater knowledge of customers, competitors, suppliers, and the environment in which the company is inserted. The marketing plan generates valuable information for the organization and makes it possible to identify the most promising business opportunities. In this way it constitutes a fundamental element for managerial decision making, based on a systematic analysis of this information and data.

3 METHOD

The methodological path of the research went through distinct phases as objectives: (i) to analyze the originality and relevance of the junction between the themes, (ii) to carry out the validation of the bibliographic research that supports the theories and academic models used, (iii) to follow a path pointed out by the bibliometric research and (iv) to carry out the theoretical, graphic and descriptive proposal of the
Principles and Concepts for development in nowadays society - Canvas and the marketing tools as assumptions for managerial decision making

consolidated model. The research began with a quantitative approach, by means of a bibliometric investigation - a statistical tool that allows one to map and generate different indicators of treatment, information and knowledge management (Guedes and Borschiver, 2005). Its application allowed for the identification of recent works among quantitative indicators that supported and provided support for the research question raised in the study, limiting the bibliographic research to a group of scientific works.

As a qualitative approach, the following phase the literature review and the selection of scientific articles, among classic and contemporary literature, was used to compose the theoretical reference about the main subjects that supported the proposition of the conceptual model: marketing plan, business plan, and Canvas. Next, secondary studies were selected and analyzed, in their propositions and organizational applications, composing the meta-analysis phase.

The research question instituted in the study guided the efforts of the researchers so that, in a theoretical way, at this point in the research, a first model could be sustained and presented, precisely so that it can be discussed in the scientific environment of the event, in a constructive way by the peers, with criticism to improve the proposed framework.

According to Polizei (2010), a business model is composed of about 70% to 90% of the complete marketing plan, a premise that supports the attempt to join both plans into a more robust and complete tool for application in the commercial and marketing environments, in a relationship of interdependence. This was the argument for the proposition of scientific research, from the limitations presented by Polizei's (2010) work. In this research it was proposed a relationship between the Canvas business model, suggested and elaborated by Osterwalder and Pigneur (2003, 2010), due to its acceptance and applicability in academic and organizational circles, and the composition of a marketing plan, a tool widely disseminated and accepted in academic and organizational circles (Kotler & Keller, 2019; Peter & Churchill Jr, 2012). The proposition is supported by the pointing of Oyedele (2016), who weaves a criticism on the need for denser, deeper and more complete tools that allow analyzing the market and the organizational strategies deployed by managers in competitive companies, which aim for greater performance and leadership quality (Calvosa, 2012; Souza Neto et al., 2006).

From the theoretical constructions of the mentioned tools, of great relevance and acceptance in academic and organizational circles, a preliminary theoretical model was proposed with the consolidation, correspondence of common points, and projections between the complete marketing plan and the Canvas business model.

4 RESULTS AND DISCUSSION

The main objective of the work was to propose a framework containing a sequence of actions that can be used to assist managers and organizations in making sustainable decisions and improving their managerial and commercial performance. It was understood that the Canvas model is a tool that allows planning and resource analysis of organizations and has facilities such as visual exposure, simplicity, global
approach, among others. And a marketing plan involves communication in an elaborate action from partners and investors to be directed to other internal and external stakeholders, such as internal managers, employees, business partners, and in some cases, current and prospective customers.

The similarity between them happens in the protagonism offered to the stakeholder "own business" (mainly partners and investors) in an involvement and decision-making for the achievement of defined goals, but in different directions (Calvosa, 2010). While the marketing plan is made possible "from" or "through" the partners and investors, in an "inside-out" movement, the business plan will be made possible "for" the partners and investors, "outside-in", as a way to present guidelines and a path to be followed by the organization, in relation to the market and the competition, being important its viability validation. In addition to communicating value, these associated tools should also help in business decision making, so that the business is dynamic and competitive, creating ways to develop purpose and meaning (Calvosa, 2020).

It was found in the literature a set of scientific works identifying the Canvas tool as adherent and suitable for decision making and strategy establishment in a dynamic, changing and competitive environment (Raash; Scholz, 2020; Silva et al., 2021; Sampaio Neto et al., 2021), which theoretically, seems to be in line with the proposition of a marketing plan (Kotler & Keller, 2019). And, with that, establish guidelines for the achievement of objectives and goals in a planned and engaging manner, only changing the direction of the flow of responsibility, instruction and process guidance (Calvosa, 2010). And it seems to be an academic and scientific gap, the study of a model that analyzes, in a joint manner, these organizational challenges or circumstances (Periódico Capes, 2021). To achieve this purpose, the authors proposed a contemplative model, which would offer synergy and interface between a complete marketing plan and the Canvas business model, as can be seen in Figure 3:
The figure shows joint elements of the complete marketing plan and Canvas tools. The legend in Roman numerals shows the origin of the steps of each tool adopted, in a hybrid model, to better support managerial decision making. There are eight steps, each one representing a combination moment of the two tools; represented by capital letters, the decision moments are occasions in which the manager has the responsibility of evaluation and decision to proceed, or not; each "moment" will be explained in Table 3 below, which has direct relation with the proposed framework.

The framework starts with the manager's decision to structure his business model; the first action of the model is "Analyze the market situation and opportunities", the depth of this step will guide the decisions throughout the rest of the process, since it will map the market situation in detail and prospect data and information that may contribute to the decisions that will follow.

The next step is to define the following items: value proposition, objectives, appropriate channels, market segments, and relationships with these segments, in order to identify if it was possible to find viable opportunities for the business or if it is necessary to carry out a new prospection. At this stage the manager must also evaluate and decide on the efficiency of the selected channels so that the message reaches the customers and what kind of relationship he wants to maintain with them.

Once the previous step has been completed, the next step is to map resources, activities, key partnerships, and sources of income. It must be determined: key partnerships; what resources the business must not lack; what activities sustain the business and its entire end-to-end chain. Here we reflect on
whether the key elements defined will provide the necessary support to sustain the strategies and action programs, and if not, we must reevaluate them.

The next action proposes to the manager to decide in which direction the marketing actions will be applied, such as: gain market share, market penetration, increase of x% in sales, among others. It defines and details in a direct way questions such as: what will be done, who will do it, when, how, among others.

With the key elements defined, the next step is to "Quantify the Cost Structure of the Operation". Thus, the manager must reflect on how much it will cost the business to accomplish what is proposed. He must also verify if the costs are coherent with the whole structure that precedes. Then we move on to the next action when we propose the calculation and definition of the financial elements of the business (profit margin, break-even point, prices and scenarios).

The next step is to "demonstrate and analyze the results. Here, the differences between projection and realization are ascertained. Here we seek to generate a data base for future analysis, performance comparisons, and the substantiation of indicators. The "Marketing Control" action consists in verifying which strategies are being successful in achieving the desired objectives. The function of control is to modify the company's strategies or their implementation in order to improve the company's ability to achieve these objectives (Mangini, Urden, & Conejero, 2019), seeking possible margins for adjustments, corrections, and implementations, which generates, therefore, learning and improvements to be implemented that can be used in the optional feedback action; it is through this channel that the data and learning can, if the manager so decides, feed the system, allowing reflection and evolution in each step of the process.

As the correspondence of Figure 3 to Table 3 below, explains and concentrates the moments the manager should make important organizational decisions to implement a competitive advantage of planning one's business based on the consolidation of the synergy between the two proposed models.
Table 3. Marketing Plan and Canvas Combined

<table>
<thead>
<tr>
<th>Decisions</th>
<th>Description</th>
<th>Reflections for Decision Making</th>
<th>Expected Products</th>
<th>Contributions to decision making</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 A</td>
<td>At this point of decision the manager must examine whether in fact there are opportunities with suitability for the proposal.</td>
<td>Who are you looking to develop solutions for? What is the current market situation? Have viable opportunities been identified for the business? Which segments will be served?</td>
<td>In-depth knowledge of the market, helping in the decision making of which customer segments to focus on.</td>
<td>These steps propose an in-depth analysis of the guiding elements of the process and will help the other decisions that follow.</td>
</tr>
<tr>
<td>Step 1 B</td>
<td>The clarity of the proposal and the objectives can help the manager in the decision making process and in measuring the results.</td>
<td>What are the objectives of the business? What identified problem does the business offer a solution to? What benefits will the customers obtain? What is the value proposition?</td>
<td>Solutions tailored to customer segments communicating through result-generating channels.</td>
<td>The manager must evaluate and analyze market data about the segment, industry, and related products.</td>
</tr>
<tr>
<td>Step 2 C</td>
<td>The manager must analyze and decide on the efficiency of the channels, because it will be the path that will allow the proposed solution to reach the customers.</td>
<td>How will the value proposition reach the customer? Through which channels is the segment most present?</td>
<td>Greater value for the segment through the type of relationship you value most.</td>
<td>These steps help the manager to analyze and decide on the efficiency of the selected channels in alignment with the defined value proposition.</td>
</tr>
<tr>
<td>Step 3 D</td>
<td>The manager's decision about the type of relationship that will be practiced must be in tune with and satisfy the segments and their demands.</td>
<td>What type of relationship will be maintained with the client? Is the chosen relationship coherent and aligned with the proposal and the defined objectives?</td>
<td>Clarity of interdependence of key parties and agents that enable solutions to reach customers.</td>
<td>Managers must evaluate which solutions best fit the customer segments and through which channels they will be most efficient.</td>
</tr>
<tr>
<td>Step 4 E</td>
<td>Defining the fundamental elements is crucial, so that it is through them that the business can be operationalized.</td>
<td>What will be done? Who will do it? When? How? In what timeframe?</td>
<td>Elements of continuous learning that make it possible to correct unwanted deviations, and incorporate changes.</td>
<td>These steps provide the manager with an opportunity to reflect on the definition of the type of relationship with the chosen segment, as well as how much the value proposition will cost the company.</td>
</tr>
<tr>
<td>Step 5 F</td>
<td>The manager must reflect and decide if his cost structure is compatible with the proposal offered by the segments.</td>
<td>Will the key elements that have been defined provide support to sustain the strategies?</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Chart 3, complement of Figure 3, the theoretical model proposed involving the Marketing Plan and Canvas tools together, presents in a more detailed way the stages and decision moments described in the figure. It is expected that the concentration of this information will contribute to more assertive decision making by managers, since, in addition to the description, the table presents reflections and contributions to decision making, in addition to describing expected products in each step in order to guide more solidly
their execution. It is a first effort to unite in perspective two tools, one of a more internal bias to the business, with another of a more comprehensive and external bias, so that from the construction and improvement it advances in robustness and practical usefulness.

The framework proposal considering the table contemplates the moments of managerial decision before the initial identification of the business opportunity. The decision moment A and its description is related to the set of reflections that can be carried out based on the rhetorical questions proposed in the model. Thus, for each step and for each decision the manager analyzes the description of the step he or she is in and reflects on the questions related to this step. After reflecting and considering these questions about his business, the manager must verify and the products that are expected. The products work as guiding elements that indicate that the manager is on the right path in his decision making. Directly related to the expected products are the contributions to the decision making process. They work as reflection elements for the learning process after having gone through all the steps and allow a reflection on the whole process, besides contributing to the internalization of the acquired knowledge.

5 CONCLUSION

Is it possible, in the organizational environment, to present a managerial decision-making based on the joint analysis in the tools marketing plan and business plan, starting from the premise that they involve the structuring of a complex strategy? From this central question, it was possible to describe the theoretical relationship existing between marketing plan and business model, mainly, through the research of Calvosa (2010), Polizei (2010), Peter and Churchill Jr (2012), Oyedele (2016), Kotler and Keller (2019), Raasch and Scholz (2020), Silva and collaborators (2021), Sampaio Neto and collaborators (2021), supported by the originality verified in Periódico Capes (2021). The objective of the work was achieved from the proposition of a framework, according to the analysis of bibliographic research, meta-analysis and a didactic opportunity detected, in a preliminary theoretical model, which suggested a more dense and deeper evaluation, with the criterion of achieving better managerial and commercial performance in decision making in the organizational environment.

The proposed model followed an initial path of generating correspondence between points of convergence of the tools studied, with the concern of not suppressing phases or adding actions or operationalizations before the ample discussion among peers and the new phases to be implemented in the research project that houses such scientific initiative, following the path initially pointed out by the literature, in tools widely accepted and applied both in the organizational environment and in academia. However, it is understood that the simple theoretical proposition of a model is a limiting factor for its validation and empirical use; however, it is a necessary step for the offering of criticism, suggestions, notes, and the construction of new research phases.

The theoretical contribution of the work was to establish a relationship between the concepts of marketing plan and business plan, bringing to new researchers an updated literature to support the interface
between the proposed themes; such relationship presents itself convergent to the potential support for managerial decision making. The practical contribution of the work was the elaboration and description of a consolidated and self-applicable model in the organizational environment for decision making based on marketing and commercial elements, present in the daily life of the manager and the organization.

The preliminary model proposed still seems incipient, needing further support, application and validation among academics, managers, organizational application, qualitative and quantitative analysis, so that it can be generalized. Therefore, the work presents as its main limitation the lack of application of the model and its presentation to the academic and business communities. It was understood, throughout the scientific orientation sessions, that the evolution of the model would go through a first exposure and critique, in a multiplicity of visions, in the environment of a scientific event, a propitious place for such construction. In this way, none of the aspects of each original tool was suppressed or any part added, so that there would be an evolution conditioned to the highest scientific rigor.

As a suggestion for future research on the subject, it is believed that the dissemination of this research will help inspire new research initiatives in the theoretical gap found. And, it is hoped that, based on the preliminary insights of the work presented, new researchers may apply, in part or in full, this knowledge and the initial model proposed, in their academic research and in their organizational environments. The approach of new researchers who wish to be part of the new phases of the research project to the GeCaPEP Research Group (Instagram: @pesquisas,gecapep) will be welcome.

Environmental concern and environmental education in university students

Edith Meryluz Claros Guerrero
meryluzclaros@gmail.com

ABSTRACT
The research is based on the environmental doctoral thesis of the Universidad Nacional José Faustino Sánchez Carrión, which evaluates the environmental dimension from an integral point of view, addressing the problem of the perception that university students have of their professional training in environmental matters (curricular plan, teaching methodology, content) in addition to their professional training in relation to the self-assessment of their pro-environmental attitudes (environmental concern). Through stratified probabilistic sampling, the sample size was determined for each professional career intentionally selected to fulfill the objective of the research. A questionnaire based on Melania Coya's proposal was applied to students from III to V Semester, from 10 professional schools, who evaluated their training in environmental matters, and the environmental concern scale. The students surveyed obtained an environmental concern score of 44.02 points out of 65, qualifying them in the medium grade, with a regular level of training in environmental matters. There is no significant correlation between environmental training and environmental concern, except for the professional careers with a professional profile related to environmental issues, concluding that the environmental concern of the students is influenced by the cultural and social environment.

Keywords: environmental training; environmental concern; methodology, professional profile.

1 INTRODUCTION
The environmental problem, in itself, is a very complex issue to address, and that is even more accentuated in recent decades, showing a considerable increase of consequences in different factors, such as the physical, biotic and social factor, which are affecting the daily activities and that despite the actions that are carried out globally to achieve awareness of care and respect for the environment, through the issuance of pro-environmentalist regulations that seek environmental sustainability. Even so, it seems that the social and economic development model is apparently not achieving the total natural balance and the wellbeing of ecosystems, therefore, it is necessary that the idea of sustainability is immersed and forms part of the culture of human beings, an alternative is to encourage environmental education, formal and informal, through the interaction of the various actors that make up society including citizens, organized groups of society, governmental, business and especially educational institutions, especially institutions of higher education, to remedy and mitigate the effects of the environmental crisis. Another concept immersed in the environmental problem is sustainability, and as mentioned above, it implies assuming the responsibility to improve the environmental conditions of the country. (García, D & Priotto, 2009) This implies taking responsibility for improving the current living conditions of all people, other forms of life and natural systems.

The university higher education institution, where professionals with different occupational profiles are trained, must be aware of the social and environmental reality and be active participants in the
transformation of society with environmental responsibility, as mentioned by Mora (2012) who considers that including the environmental dimension in Higher Education is imperative, and this should be done through the application of models focused on sustainable development. (Silva, 2007) considers that including the environmental dimension in the educational system should lead to new forms of relationship between human beings and nature, among themselves and with the rest of society, which will lead to the formation of environmental awareness as an immediate need in the preparation of future university graduates. Noguera (2007)

According to Cárdenas (2013a), university environmental responsibility is the action of the university put into practice in principles and values that contribute to the formation of professionals and citizens with awareness, commitment and proactive participation in the solution of environmental problems, through the exercise of its substantive functions of training, research, extension and management, the author also considers that this institution must incorporate the environmental dimension to its institutional, educational and labor project.

If we analyze the national regulations, in art. 127° of the national policy of environmental education of our country, mentions that: "environmental education becomes a comprehensive educational process that occurs throughout the life of the individual, which seeks to generate in him/her the knowledge, attitudes, values and practices, necessary to develop their activities in an environmentally appropriate way, with a view to contributing to the sustainable development of the country", in that sense Peru through the Ministry of Environment (MINAM) through the Inter-University Environmental Network - Interuniversia Peru (RAI Peru), has initiated a process since 2012 (Cardenas, 2018c); and is in line with the Bicentennial Plan - Peru towards 2021.

An optimal environmental education with environmentally responsible values and attitudes would be to consider the environmental dimension as part of professional training, adapting the university curriculum to influence a change in the behavior of the entire university community, internalizing respect for the environment and natural resources.

According to the University Law. (Law N°30220, 2014): "The university is an academic community oriented to research and teaching, which provides a humanistic, scientific and technological training with a clear awareness of our country as a multicultural reality". And among its purposes among others is to "promote human and sustainable development, serve the community and seek integral development".

This document is based on the doctoral thesis "Environmentalization of the Universidad Nacional José Faustino Sánchez Carrión", where a diagnosis was made of the environmental conditions of the educational institution. (Claros, 2020) where a diagnosis of the conditions of environmentalization in which the educational institution is located was made, being a motive of analysis the degree of environmental concern of the University student that allows to know the student's perception of the environmental problems, and the level of training in environmental matters that under the perception of the student is receiving as part of their professional training, apart from their professional profile.
2 METHODOLOGICAL STRATEGIES OR MATERIALS AND METHODS

The research design had a quantitative, correlational, cross-sectional approach, the population was composed of students enrolled in the Semester 2019 - I, distributed in 13 faculties with 34 professional careers, some related to the environmental theme, and others that "are not related", to make the difference the curricular plan of the professional careers is analyzed, which according to regulations of the institution, is divided into three curricular areas: Area of general studies or basic training, area of specific studies or basic professional training and the area of specialty or specialized professional training, being the basic training, where the competence in science, technology and relationship with the physical environment is identified, being studied in the first four cycles.

Based on the recommendations of Fox (1987, 2ª: 373) cited by (Coya, 2001) who mentions that in order to deliberately achieve the representativeness of the sample, three conditions must be fulfilled: (a) to know the characteristics (variables) that are related to the problem under study; (b) to have the capacity to measure those characteristics; c) to have data from the population on the characteristics to use them as a basis for comparison and the non-compliance with one of these conditions should justify the use of another type of method, the university population is restricted to cycles III to VI Cycle, discarding the first cycles assuming that they do not have enough information to judge the professional training and the students of higher cycles, to achieve homogeneity, since not all are studying in a competency-based plan, only one professional career is chosen from those that have related curricular plans. The population was 3183 students, distributed in 10 professional careers. By means of non-probabilistic sampling, with conditioned criteria, the exclusions required by the research were made, and 278 students were surveyed.

A questionnaire adapted to the reality and characteristics of the region was applied to the surveyed students to learn about environmental education, and for the degree of environmental concern, the Environmental Concern Scale was used, proposed by Coya (2001), based on the Environmental Concern Scale (EPA) designed by Weigel and Weigel (1978), adapted by Holahan (1991) or Amerigo and Gonzales (1996). Four dimensions were identified for the evaluation of environmental concern: Non-personal control over the environment, which evaluates whether the student assumes control of pollution and presents the solution; personal effort for environmental conservation, whether the student is willing to assume some personal cost; prevention and control of pollution, the student expects the authorities to find solutions or propose alternative solutions; and irresponsible attitude towards pollution, which evaluates whether the student values the real importance of pollution and takes responsibility for his or her actions. In the documentary analysis, a review of the curricular plans was made, observing the number of courses by thematic areas, registered in the institution's Web page.
3 RESULTS AND DISCUSSION

For a sample of 278 students, with an average age of 20 years, made up of students from careers not related to the environmental area: Statistics and Computer Science (4%), Economics and Finance (15.1%), Chemical Engineering (10.1%), Electronic Engineering (10.8%), Sociology (9%), Nursing (10.1%), while the schools related to the environmental area are Zootechnical Engineering (7.9%), Biology with mention in Biotechnology (6.1%), Environmental Engineering (14.4%), Agronomy Engineering (12.6%).

**Descriptive Analysis: Environmental Concern:** Of the 5 items with negative attitudes, 8 with positive attitudes, of the Environmental Concern Scale, distributed in four dimensions that evaluate the attitudes of the students, obtained in a range of 13 - 65 and a potential average of 44.02, it is located in the medium degree of environmental concern.

Note: (-) Unfavorable attitude (+) Favorable attitude

If we analyze the results by career or professional school, we obtain that Environmental Engineering has positive results and this is explained by its professional profile, according to the dimensions considered in the research, while the schools with little or no training in environmental matters have low potential averages.

In relation to environmental training, 65.47% of the students surveyed at the Universidad Nacional José Faustino Sánchez Carrión consider it to be fair, 19.06% consider it to be good and 15.47% have not had any training in environmental matters, specifically environmental training is valued in the theoretical content.

Referring to the Curricular Plan, based on the documentary information, the schools have courses with content on environmental issues as part of their curricular plan from most to least: Environmental Engineering, Agronomic Engineering, Biology with mention in Biotechnology, and Zootechnical Engineering; and the schools that do not have courses with environmental issues are: Electronic Engineering, Chemical Engineering, Statistics and Computer Science, and Economics and Finance. (Venegas & Quijano, 2017). The schools that do not have courses with environmental themes are: Electronic Engineering, Chemical Engineering, Statistics and Computer Science, Economics and Finance; coinciding with what was obtained by those who conclude Administration and Accounting, they do not contain subjects related to the environment, while in the School of Nursing its thematic contents are related to the humanistic aspect.
Regarding the quality of the environmental training received, the students who have a favorable opinion are those of the School of Environmental Engineering; for those of Zootechnical Engineering, Nursing, Biology with mention in Biotechnology, Statistics and Computer Science, they consider that the training will allow them to know, understand, confront and act on environmental issues in more than 50% of the cases. Where there is some negativity in this aspect is in the students of Sociology, Economics and Finance (higher number) and Chemical Engineering in a lower percentage.

In relation to the teaching methodology referred to environmental issues: Students of Environmental Engineering, Agronomic Engineering, Zootechnical Engineering and Biology with mention in Biotechnology, consider that teachers have developed within the contents and methodology the environmental issue in greater proportion; in Economics and Finance, they consider that teachers do not develop anything related to environmental issues as part of the methodology of the courses, a result that coincides with the one obtained by (Padilla, 2016) the researcher, who found that the training of teachers is still incipient, which contrasts with the positive attitude of the students.

**Correlational analysis:** To determine if the degree of environmental concern is related to the environmental education of the students of the Institution, in the exploratory analysis of data, to determine if the sample adjusts to a normal distribution, we use Kolgomorov - Smirnov (correction of the significance of lillieforis), it is obtained for environmental education with a value of 0.070 and \( p=0.002<0.05 \) the null hypothesis is rejected, concluding that there is no normality in the data; and for the variable environmental concern with a value of 0.062 and \( p=0.011<0.05 \), it is concluded that the data are not normal. Considering that the data are ordinal and non-parametric in both variables, we use Spearman's rho correlation coefficient, and for \( r = 0.081 \) with \( p=0.179>0.05 \), we conclude that there is no significant correlation between the variables.

In response to the question: If the level of environmental training received from the University correlates with the extent to which students consider the importance of the environment, we obtained \( r=0.109 \) and \( p=0.071>0.05 \), which indicates that although it is necessary to have professional training in environmental issues as a basis, to know, interpret, and promote actions in favor of the environment, this does not imply that the importance of the environment is not considered and valued (62.59%), and in a similar way for each school.

- In relation to the correlation of the dimensions of environmental concern:

  Non-personal control over the environment is significantly correlated with the personal effort that the student is willing to make for the conservation of the environment \( (r=0.135^*, \ p=0.025<0.05) \); at the same time it is significantly correlated with the irresponsible attitude towards pollution, in a direct way \( (r=.435^{**} \ p=.000<0.01) \) (both negative attitudes).
It is also observed that the student is aware that he/she has to be an active part to stop pollution and seek the protection of the environment, which is statistically demonstrated (r=.571**; p=.000<.01) that there is a high correlation of personal effort for the conservation of the environment and to achieve the prevention and control of pollution, with a direct and positive relationship.

There is a significant correlation between pollution prevention and control and irresponsible attitude towards pollution (r=-.350; p=.000<.01), whose relationship is indirect, i.e., as the irresponsible attitude decreases, the search for pollution prevention and control will increase.

- In relation to the correlation of the Environmental Training dimensions:
  
  With respect to humanistic and pro-environmental training in the contents of the courses, it correlates directly and positively with the number of courses in the curricular plan (r=.415, p=.000<.01), which implies that the greater the number of courses with environmental themes, the greater the humanistic training; and at the same time it is significantly correlated with the quality of environmental education (r=.302; p=.000<.01), and with the methodology used by the teacher in the development of the contents (r=.411**; p=.000<.01).

  The number of courses that are part of the environmental curriculum is significantly correlated (r=.547**, p=.000<.01) with the quality of training in environmental issues, and with the teaching methodology (with a curriculum with more courses related to environmental issues (r=.632**, p=.000<.01); and the quality of university training is significantly correlated with the methodology used by the teacher in environmental issues (r=.507**, p=.000<.01); and the quality of university training is significantly correlated with the methodology used by the teacher in environmental matters (r=.507**, p=.000<.01).

- Correlation between dimensions of environmental concern and dimensions of environmental education:
  
  A high significant correlation is observed between the humanistic and pro-environmental training in the contents of the courses, with the non-personal control over the environment, in a direct and positive way (r=.192, p=.001<.01), and with the methodology that the teacher uses in the classroom in environmental matters (r=.150, p=.012<.05); which implies that as long as the teacher encourages the formation in ethical values, critical analysis of reality, and uses methodologies that include the environmental dimension in his lecture with practical examples, the students will have a greater incentive to actively participate with a sense of responsibility and adopt positions that lead to the control of pollution and conservation of the environment.

  The quality of university training in environmental issues is correlated with the personal effort that the student is willing to make for the conservation of the environment (r=.131; p=.030<.05), with the adoption of actions and active participation in the prevention and control of pollution (r=.231; p=.000<.01).

  In relation to the correlation of the level of environmental training, with the degree of environmental concern of the students by professional school, there is a significant correlation at a significance level of 0.05 in the School of Environmental Engineering (r=.375*; p=.017<.05), between the level of
Environmental Concern and their environmental training, with a positive relationship and there is correlation at a significance level of 0.01 in the School of Sociology for (r=.549**; p=.005<0.01) between both variables, while the remaining schools, statistically there is no significant correlation between both variables (p>0.05).

Berenguer and Corraliza (2000) mention that "when concern for the environment is evaluated at a general level, high levels of environmental concern are registered; however, this evaluation is not sufficient to predict other pro-environmental beliefs and values", in this research the students were asked to self-evaluate and answer the importance they give to the environment, and it was obtained that for 62.59% the environment is very important to them, and through the evaluation of the environmental concern scale (EPA) has a potential average score of 44.02 points out of a maximum of 65, which corresponds to a medium degree of environmental concern (61.5%) with students who have a high degree of concern (35.97%).

"Environmental concern has been considered a descriptive parameter of the level of environmental awareness, and a predictor variable of environmental behavior" (Berenguer & Corraliza, 2000). (Berenguer & Corraliza, 2000) Under this premise, it was observed that most students are aware of the existence of pollution in lakes, rivers, and air, but consider that nature, through purification processes, will return it to normal (non-personal control over the environment); however, they are willing to make personal sacrifices, whether economic, time, or other activities to prevent the extinction of animals and reduce the rate of pollution (personal effort for the conservation of the environment); as part of the actions of prevention and control of pollution, as well as to demand government agencies their direct participation for the control of pollution, but also consider that secondary schools should be the first to provide education on the conservation of natural resources, this statement is related to what Amérigo and García, (2014) express: "people value their concern for environmental problems according to whether these have harmful consequences for oneself, other human beings or the biosphere".

The highest percentage of students surveyed considered that the environmental training received is Regular and agrees with the analysis of the indicators proposed by Cárdenas (2014); who considers that the incorporation of the environmental perspective in the training function of universities is moderate to low.

The pro-environmentalist attitudes on the part of the students is influenced by their professional profile, such as the School of Environmental Engineering, whose training is correlated with the degree of environmental concern, unlike the other schools analyzed in this research, which is consistent with (Casas & Jaula, 2004) The School of Sociology, despite not having an "environmentalized" professional profile, has a correlation between both variables, which explains that positive attitudes towards the environment are not only conditioned by academic training or formal education, but also by the environment, culture and customs that are innate in human beings, as mentioned in the following (Delgado, 2012) that informal education refers to the diverse learning achieved through daily experiences at home, work, street, travel,
etc., by talking, reading or using mass media, and the author considers that the information, skills and attitudes that people possess are due to it.

4 CONCLUSION OR FINAL CONSIDERATIONS

Pro-environmental attitudes such as environmental concern in university students is not only influenced by their formal education or professional training, but depends on the various learning they acquire from their daily life activities and cultural and social environment.

To assume the environmental policy as an integral institutional policy, which will allow students and future professionals to identify environmental problems that cause a decrease in the quality of life, to have an interdisciplinary approach and to be active actors in the performance of their work and professional activities in favor of sustainability.

It is important to generate a teacher training and updating plan as an academic policy, with an interdisciplinary approach, with collaborative work that allows adopting and internalizing the environmental culture, improving collective and environmentally responsible performance at the University.

This research was carried out with the participation of Dr. Cristian Iván Escurra Estrada, who departed to infinity, a tribute to his memory.

ABSTRACT

Brazil is the fifth largest generator of WEEE in the world and the largest generator in South America. The growth in the generation of this type of waste points to the need to adopt measures to mitigate its potential negative impacts, either to reverse the increase in the generation of WEEE or to improve the rates of reuse and recycling. Considering that the State of São Paulo represents approximately 21.86% of the Brazilian population and presents the second highest GDP per capita in the country, it was deemed relevant to investigate the management of WEEE in São Paulo's municipalities. This paper aimed to characterize the WEEE management in some municipalities of the...
State of São Paulo, Brazil. Relevant aspects were considered for the generation of WEEE, such as industrialization index, number of inhabitants and GDP per capita. To this end, a qualitative research was conducted, using as a database the information collected by the Survey on Solid Waste Management in Municipalities of the State of São Paulo. In the mentioned research, it was applied to São Paulo's municipalities a questionnaire of 155 questions that covered several aspects of solid waste management within the scope of municipal public administration. The results of this work enabled the identification of which aspects of the WEEE management are related to the municipal actions focused on the management of this waste, as well as to demonstrate how the normative and legal provisions instrumentalize such actions, and raise some difficulties.

**Keywords:** Solid Waste, Reverse Logistics, Electro-electronic Waste, Public Policies.

1 INTRODUCTION

The problem of solid waste has generated discussions and imposed the adoption of measures to mitigate its impacts in Brazil and worldwide. This is because population growth in recent decades coupled with changes in consumption patterns have led to greater generation of this waste. The World Bank calculated that in 2016 the amount of municipal solid waste generated worldwide was 2.01 billion tons and projected a value of 2.59 billion tons for 2030 and 3.40 billion tons in 2050, expressing a very significant increase (KAZA et al., 2018).

Studies such as the World Bank’s *What a Waste 2.0* report indicate the existence of a correlation between income levels, urbanization rates, and waste generation, and estimate that waste generation in low-income countries is expected to be three times higher by 2050. The world average noted is 0.74 kg *per capita per day*, and can range from 0.11 kg to 4.54 kg *per capita* (KAZA et al., 2018). Figure 1 represents the average *per capita* generation per day around the globe, showing a higher generation in North America, Oceania, and some countries in Asia and Europe.

![Figure 1: Average solid waste generation worldwide (kg/per capita/day)](image)
The same study indicated that in Brazil the average waste generation is 1.04 kg per capita per day, i.e., higher than the global index and the regional index - since the average in Latin America and the Caribbean is 0.99 kg per capita per day (KAZA et al., 2018).

Over one-third of recyclable waste is recovered in higher income countries and as income increases, so does the recovery rate. This is also related to the comprehensiveness of separate collection, which is greater in these countries. Thus, one might conclude that in lower income countries, selective collection is less comprehensive and the waste recovery rate is lower.

Within this context of population growth and changes in production and consumption patterns, the rise of the digital market and of communication and information technologies stands out. Furthermore, one further highlights the constant innovations of these technologies which, coupled with the shortened product life cycle and the wide variability of options, result in increased consumption and consequently, a significant increase in the generation of electro-electronic waste (WEEE) (PARRA; P.H.; PIRES, S.R.I, 2003 apud XAVIER, L.H et al., 2010).

WEEE, by definition, are those that result from equipment "equipped with electrical circuits or components and a power supply or battery" (FORTI et al., 2020, p. 19). Such equipment, because it contains heavy metals in its composition, become potential causes of environmental impacts when discarded in an irregular manner, which can cause soil and water contamination and pose risks to human health and the environment.

As for electro-electronic equipment, each product has a useful life cycle, according to its specificities and its composition. Many consist of heavy metals such as chrome and lead, of noble metals such as gold, silver, copper, amongst others. Thus, characteristics such as economic value and their potential environmental impacts are also variables and, because of this, their management must take them into account (FORTI, 2019 apud MORAES et al., 2021).

The most recent United Nations report on WEEE indicated that in the year 2019, about 53.6 million tons of WEEE were discarded and only 17.4% of this volume was recycled. It was further estimated that in 2030, this volume will approach 74 million tons, which represents an increase of over 35% (FORTI et al., 2020 apud MORAES et al., 2021).

Brazil is the fifth largest generator of WEEE in the world and the largest generator in South America. In 2019 it was counted the volume of 2,143 kt of WEEE, which represents an average of 10.2 kg/inhabitant, higher than the global average of 7.3 kg/inhabitant (FORTI et al., 2020). However, less than 3% of WEEE was recycled or reused (GREEN ELETRON, 2021).

The volume of WEEE generated and the growth levels of this type of waste in the world are alarming (FORTI et al., 2020) and warn of the need to adopt measures to mitigate their potential negative impacts, either to reverse the increase in the generation of WEEE or to improve the rates of reuse and recycling.

In as much as this kind of waste is concerned, the World Bank specifically pointed to a general average of 0.2 kg per capita per day and indicated that the generation thereof is also directly proportional
to countries' economic development and income levels (KAZA et al., 2018). In this same vein, the Study on Technical and Economic Feasibility of Reverse Logistics of Electrical and Electronic Equipment prepared by the Brazilian Agency for Industrial Development (ABDI) in partnership with the Ministry of Industry Development and Foreign Trade (MDIC), identified a strong correlation between per capita GDP and WEEE generation (ABDI, MDIC, 2012). Thus, it is inferred that the higher the GDP per capita, the greater the volume of WEEE per capita generated.

Bearing in mind this problematic, this article aimed to characterize the management of WEEE in some municipalities of the State of São Paulo, Brazil. We considered relevant aspects to the generation of WEEE, such as industrialization index, number of inhabitants and GDP per capita. Thus, considering that the State of São Paulo represents approximately 21.86% of the Brazilian population (IBGE, 2020) and presents the second highest GDP per capita in the country (CODEPLAN, 2018), it was considered relevant to investigate the management of WEEE in São Paulo municipalities.

To this end, it was carried out an investigation of qualitative nature, having as data base the information collected by the Research on Solid Waste Management in Municipalities of the State of São Paulo, Brazil (MORAES, 2021). In the mentioned research, it was applied to the municipalities of São Paulo a questionnaire with 155 questions that covered various aspects of the solid waste management within the municipal public administration. Among the respondents, it was considered only those who declared to carry out some kind of WEEE management action.

2 NORMATIVE AND LEGAL ASPECTS OF WEEE MANAGEMENT IN BRAZIL

In the Brazilian scenario, the National Solid Waste Policy (PNRS) represents the most important regulatory framework regarding solid waste management. This policy was established by Law No. 12,305/2010 and established among its principles the principle of shared responsibility for the life cycle of products, according to which all actors involved in the stages between manufacturing and disposal are held responsible for their environmentally sound management. This includes efforts not only to minimize the impacts associated with final disposal, but must also consider actions that promote the reduction of WEEE generation.

To operationalize this process, reverse logistics emerges as an instrument that enables the return of solid waste to the business sector, for its reuse or adequate final destination. Thus, one may not only reduce the amount of discarded waste (rejects) but also reduce the amount of raw materials required to produce new items as it enables the reuse of materials. Therefore, reverse logistics is considered an instrument of economic and social development (BRASIL, 2010).

Through reverse logistics, one must then develop a set of actions to enable the collection and return of waste to the business sector. In this context, the management of WEEE goes through a complex process that involves the consumer's responsibility in separating waste and disposing of it at an adequate location;
the offer of specific collection points for these materials; and finally, actions directed at the reuse, recycling and environmentally adequate final disposal.

In order to make the practice of reverse logistics feasible, the Guiding Committee for the Implementation of Reverse Logistics Systems was created through Decree No. 7.404/2010, whose objective was to provide strategic guidelines for the implementation of these systems (BRASIL, 2010).

Subsequent to the institution of the PNRS, other legal instruments were also created to regulate solid waste management in Brazil. Decree No. 10,936/2022 regulated Law No. 12,305/2010 in several aspects and brought a chapter especially to address the issue of reverse logistics, which established the National Reverse Logistics Program, integrated with the National Solid Waste Management Information System (Sinir) and the National Solid Waste Plan (Planares), in order to optimize the implementation and operationalization of the physical and logistical structure.

It also established that manufacturers, importers, distributors and traders must structure, implement and operate reverse logistics systems, as well as ensure the economic and financial sustainability of this system, and be responsible for conducting reverse logistics in proportion to the products they put into circulation. To this end, the agents may provide delivery points for reusable and recyclable waste and adopt procedures for the purchase of these products or their packaging.

Specifically about WEEE, in 2019, the Sector Agreement for the Implementation of the Reverse Logistics System for Household Electrical and Electronic Products and their Components was signed. This document established a commitment between the Union, the manufacturers of electro-electronic equipment (EEE), the distributors and importers of computer equipment, the software companies and information technology services, the management entity (Green Eletron), in order to define guidelines to structure and operationalize the WEEE reverse logistics system.

This document set targets for the installation of voluntary delivery points (PEVs), coverage of municipalities and percentage of WEEE contemplated by reverse logistics. Thus, by 2025 more than 500 PEVs should be installed in the 400 largest municipalities in the country, so that at least 17% of commercialized EEE are collected and receive proper disposal (the base year for the calculation of the volume of EEE is 2018). Demographic and geographic criteria, EEE consumption estimates and financial capacity to sustain the reverse logistics system were considered to define the quantity and location of the PEVs.

In addition to the Sector Agreement, the Basic Operating Manual was published, which contains technical guidelines for the correct handling, transportation and storage of electrical and electronic products (BRASIL, 2020). This Sector Agreement was ratified by Decree 10.240/2020, which reaffirms the commitment between the Public Authorities and the private sector, mainly in relation to the industry and trade of electro-electronic equipment for domestic use - not including, therefore, those of general use. Figure 2 depicts the stages of the reverse logistics cycle, as set forth in the referred decree:
The beginning of the WEEE reverse logistics process depends on the direct collaboration of consumers so that the WEEE reaches the reverse logistics system. After, discarded products must be received and stored until they are directed either for reuse in the production chain or for the appropriate final disposal. For this, the availability of PEVs is required, in addition to the practice of selective collection in a comprehensive manner. Subsequently, these products are transported to the consolidation points; when possible, these products must be reintroduced in the production process and, finally, when they cannot be reused, they must receive the final destination environmentally appropriate (BRASIL, 2020).

3 METHODOLOGY

This study is characterized as descriptive and exploratory since it addressed a theme that has yet been little investigated, that lacks statistical data, and sought to characterize the studied phenomenon and identify variables that relate to the research problem. The National Solid Waste Policy (Federal Law no. 12,305/2010) was adopted as the legal framework, since the principle of shared responsibility, established by it, guides the reverse logistics systems currently established in Brazil. Decrees n. 10,240/2020 and 10,936/2022, which provide on reverse logistics, including WEEE, were also considered.

At first, the research was directed to the state of São Paulo in general and, in a second moment, after identifying the municipalities that develop actions related to the management of WEEE, it was focused on the analysis of data from these municipalities to understand and characterize how they act upon the demands of collection, classification and disposal of their waste.
To this effect, data collected by Moraes (2021) was employed in a research that is still under development and that proposes to diagnose solid waste management at municipalities of the State of São Paulo. The research comprised a pre-structured questionnaire containing 155 questions that comprise several aspects pertaining to the implementation of the PNRS in public administration. Questions were sent to some municipalities by e-mail as of the Google Forms platform so as to facilitate the data gathering process as well as standardize the relation of replies obtained by questions.

Thus, a total of 220 municipalities voluntarily answered the questions and among them, 110 were highlighted for the present study, according to the selection criteria used, which were mainly based on the existing relationship between the municipalities surveyed and the use of mechanisms and forms of WEEE collection. Figure 3 represents the state of São Paulo, highlighting the municipalities studied in this work in different colors (in gray are the municipalities that were not covered in this analysis).

The scheme shown in Figure 4 seeks to build a logical sequence of steps, methods and processes applied by Moraes et al. (2021) on the data until it reached the stage of graphical representation.
Regarding the "qualitative characterization", it is related to descriptive data, which could not be standardized for a numerical analysis of the data. In this sense, it is important to emphasize the relevance that the data standardization has for the research, because it is through it that it becomes possible to analyze a large volume of data, either by processing graphically or statistically. The non-standardized data demonstrate particular and descriptive aspects of the municipalities, which were later assessed individually, so that it was possible to explore particular aspects.

For the qualitative analysis of the data obtained through the questionnaire, it was resorted to the construction of a comparative matrix (Chart 1), in which activities acknowledged by the studied municipalities as good practices in the management of WEEE were highlighted. Thus, examples of good practices were related to WEEE management aspects and to the legal frameworks that refer to them, aiming to demonstrate how the legal instrumentation is used as support for the implementation of WEEE reverse logistics actions.

**4 RESULTS AND DISCUSSION**

As previously stated, among the 220 municipalities that responded to the Survey on Solid Waste Management in Municipalities of the State of São Paulo, Brazil (MORAES, 2021), 110 were selected for the present study as they demonstrated the existence of mechanisms or forms of WEEE collection. Thus, it is noticed that half of the responding municipalities do not comply with the obligation to implement a reverse logistics system for WEEE, as established in the PNRS.

For the aspects that will be discussed in this section, it was considered, therefore, only 110 municipalities. Thus, in line with the criterion adopted, the totality of the studied municipalities declared to have selective collection for WEEE. It is important to emphasize the importance of selective collection for the success of reverse logistics, since this practice is part of the initial stages of the reverse logistics system.
To selectively collect their waste, municipalities are encouraged by legislation to act in partnership with cooperatives or other forms of association of collectors of reusable and recyclable materials. According to the PNRS, municipalities that do so will have priority in accessing federal resources.

Another relevant aspect refers to environmental education. Just over half of the responding municipalities (52.72%) stated that reverse logistics approaches are included in their environmental education and social communication programs. However, as there is no specification on awareness raising as to WEEE management, it was not possible to conclude whether specific programs are developed for this waste.

It is noteworthy that actions related to environmental education are fundamental to mobilize the population on the separation of their waste, this being the starting point of the entire reverse logistics process. Consumer responsibility is addressed in several normative instruments, such as decrees n. 10.240/2020 and n. 10.936/2022 and, in order to encourage the necessary change of habits to improve waste reuse rates (including WEEE), environmental education is a key part of this process.

A very important instrument for solid waste management is the association in inter-municipal consortia. This type of arrangement allows municipalities to develop actions related to the management of their waste in a cooperative manner, enabling the search for solutions that are better suited to local and regional realities. Of the municipalities included, 36 said they participate in inter-municipal consortia and 11 replied that their inclusion in the consortia helped in the implementation of reverse logistics. However, only three municipalities declared that they develop activities related to WEEE through consortium solutions. These results are pictured in Figure 5:

Figure 5: Relationship of the consortia with reverse logistics

Caption: Orange: consortium municipalities, Yellow: consortium helps implement reverse logistics, Green: consortium assists in WEEE related activities
Source: Prepared by the authors. Based on MORAES et al., 2021.
Another strategy that might be beneficial to WEEE management is technological innovation. It was possible to verify in the replies received from municipalities that, despite the fact that a reduced number of municipalities use this kind of tool (5.45% only), a large portion of respondents (68%) would use free software to support the management of their waste and 40% see benefits in the use of software even if it were paid for.

Through Pearson's statistical analysis, it was possible to glimpse important relations among the variables studied (PE.2020 - Population Estimated for 2020; GDP.2018 - Gross Domestic Product in current values in thousand Reais; NF_RS - Number of employees in the management of Solid Waste; NFS_MA - Number of employees involved in the Secretary of Environment; and NFCS_MA - Number of civil servants involved in the Secretary of Environment), as demonstrated in the study Waste Management of Electronic Equipment in Municipalities of the State of São Paulo: characterization and proposed improvements (MORAES et al, 2021).

Such relations made it possible to infer that the GDP has a direct influence on the quantity of employees, hired or not, working in the management of solid waste. It was observed that the higher the GDP, the greater the municipal investment in hiring employees for the environmental department. The estimated population variable was not decisive for the amount of employees involved in the management of solid waste, since the average number of employees was higher in municipalities of intermediate population ranges (from 100 to 500 thousand inhabitants), surpassing even the amount found in municipalities with more than 500 thousand inhabitants.

As of Moraes (2021) and an analysis of legislation pertaining to WEEE management, Moraes et al. (2021) developed Table 1.

Source: Moraes et al., 2021.
From the aspects studied, actions considered as good practices in the management of WEEE were raised. It was observed that there is a common understanding among the municipalities participating in the research, that environmental education is the main mechanism to promote the environmentally sound management of solid waste, in general.

Although more than half of the municipalities have informed that their environmental education and social communication programs include reverse logistics approaches, it was not possible to verify a broad approach to the WEEE theme, given that all replies referred to solid waste management in general.

It was also identified that there is a divergence in the understanding of some concepts, especially with respect to Article 7 of the PNRS, which defines the policy objectives according to the order of priority: (i) non-generation; (ii) reduction; (iii) reuse; (iv) recycling; (v) treatment of solid waste; and (vi) environmentally appropriate final disposal of waste (BRASIL, 2010).

It was possible to understand that the pre-consumption stages, i.e., those that precede WEEE disposal, are still little discussed since, from the total of municipalities that responded to the survey, only two responded that they develop "reuse" practices and six develop actions to "reduce the generation" of this waste (MORAES et al., 2021).

5 CONCLUSIONS

Literature review and document analysis enabled the glimpse that there have been advances in legislation pertaining to reverse logistics in general and specifically for WEEE but that, despite this, the reuse rates of this waste are still insignificant. It was not possible to evaluate results in as much as established targets for WEEE reverse logistics are concerned given the fact that insufficient statistical data was found to this effect.

As to São Paulo State municipalities assessed in this study, it was verified that most do not develop reuse and WEEE generation reduction practices. Although there is an approach related to reverse logistics in environmental education policies, WEEE is still not widely mentioned. It was possible to identify which aspects of WEEE management relate to municipal actions directed towards the management of this waste, as well as demonstrate how the normative and legal provisions instrumentalize such actions.

The data analyzed also indicated that municipalities with larger population ranges do not necessarily have a large number of employees involved in the provision of services related to solid waste management.

Reports on WEEE indicate that the generation of this type of waste presents significantly high rates, which demands actions both from public authorities, the private sector and civil society to curb this increase and reduce the resulting negative impacts. It was perceived that the association in intermunicipal consortiums and the use of software are tools that can contribute to improve the rates of WEEE reuse.

Finally, the importance of studies such as this one is emphasized, given the relevance of this theme and the lack of sources of information and research on WEEE in Brazil.

ABSTRACT
This report describes the performance of the Oncology Navigation Program with a patient with breast cancer and previous comorbidities. The interventions took place in a chemotherapy outpatient clinic of the private health network to ensure compliance with the therapeutic plan, respecting one’s individuality. Thus, highlighting the importance of monitoring in minimizing care barriers and clinical complications related to cancer treatment.

Keywords: Patient navigator, Cancer, Oncology Nursing.

1 INTRODUCTION
Cancer is a public health problem worldwide, with high morbidity and mortality rates. In Brazil, the number of 625,000 new cases was estimated for the triennium 2020-2022 (INCA, 2020). Bray et al. (2018) mention that the most common types of cancer interact with individuals' lifestyle, social and economic factors, as well as regional issues that also affect the incidence and mortality.

Chemotherapy is a cancer treatment option that can lead to changes and limitations, and it is important for nursing professionals to adapt and optimize cancer care planning (Andrade; Silva, 2007). The toxicities associated with treatment are expected adverse effects; however, they should be monitored and managed early, ensuring treatment safety and quality of life (Iuchno; Carvalho, 2019).
Cancer navigation is a systematic and individualized care strategy provided to individuals diagnosed with cancer and their caregivers (Osório et al., 2020). This care service provides that a professional, then called a navigator, welcomes this patient and accompanies him/her during this process, permeating all stages with the purpose of reducing bureaucratic barriers of the health system, positively impacting the early initiation of treatment (Freeman; Rodriguez, 2011).

Navigation programs are already a strategic reality of cancer patient care internationally, focused on the management of the individual's treatment with the purpose of accelerating the access to health services, assessing and assisting under a multidisciplinary and interdisciplinary perspective (Zibrik, Laskin, Ho, 2016).

2 CASE REPORT

This report describes a case assisted by Oncology Navigation, which highlighted the importance of this program in minimizing barriers and/or clinical complications related to cancer treatment. A 58-year-old woman, diagnosed with breast cancer, with secondary diagnoses of type II diabetes and chronic renal failure, on hemodialysis treatment through arteriovenous fistula, was followed.

The therapeutic plan was six cycles of outpatient endovenous chemotherapy with Pertuzumab, Trastuzumab, Docetaxel and Carboplatin. The multidisciplinary team approach started soon after the medical referral for the first chemotherapy session, through a face-to-face meeting. The objective was the welcoming, general orientation, evaluation of health conditions, identification of needs and possible offenders in an individualized manner.

The inclusion of the patient in the navigation program enabled a preventive approach to intercurrences and aggravations, such as the indication of a fully implanted catheter and the alternate scheduling with hemodialysis sessions. Symptoms of toxicity and various doubts of the patient during the process were monitored and conducted by the Nurse Navigator. Conducts such as anticipation of medical consultation and nutritional assessment, avoided the worsening of symptoms and a possible hospital admission. There was pharmaceutical evaluation and intervention with appropriate dilutions due to the patient's health condition, psychological follow-up to face the change in health status and strengthening of the support network. In turn, nutrition followed the patient throughout the treatment, monitoring the impact of food on the overall condition, according to the toxicities presented.

3 DISCUSSION

Oncology navigation is a strategy that aims at the comprehensive care of cancer patients, and has been created to meet the demands of this public (Pautasso et al, 2018). It is of utmost importance to plan care based on the specific needs of cancer patients in order to bring safety and quality to their experience.

Nursing is the category that actively participates in the care of the individual and fits very well into this guiding role of care. The oncology nurse navigator is an essential professional in the follow-up of
cancer patients and their caregivers in all phases of the oncological journey, providing assistance through scientific evidence and focusing on the patient, taking into account the experiences of the individual (Baileys et al, 2018).

Based on this report, we highlight the role of the Nursing Navigation program as an articulator of integrated care, facilitating the communication between patient and family with the team, promoting the construction of a therapeutic plan adjusted to the patient's needs.

ABSTRACT
This article examines the tourist boom at the salt flats of Salar de Uyuni, Bolivia, and its profound effect on the local economy and culture. Ethnographic data is used to analyze these developments through the theoretical-methodological tools of the sociology of tourism (Cohen 1984; Teti 2009). I seek to understand the transformations in this small town over the last 30 years, and the consequences of these changes.

1 INTRODUCTION
This article examines the tourist boom at the salt flats of Salar de Uyuni, Bolivia, and its profound effect on the local economy and culture. Ethnographic data is used to analyze these developments through the theoretical-methodological tools of the sociology of tourism (Cohen 1984; Teti 2009). I seek to understand the transformations in this small town over the last 30 years, and the consequences of these changes.

The city of Uyuni lies in an inhospitable region of the Andean Altiplano, between the Cordillera Real and the Cordillera Occidental. It has roughly 35,000 inhabitants (INE 2016) and, until recently, was difficult to access. The deserts, volcanoes, lagoons, and rock formations in the surrounding department of Potosí have transformed the region into a popular tourist destination.

However, the highlight of any visit is the Salar de Uyuni. At 10,000 m2 and an average altitude of 3,600 meters above sea level, it is the largest salt desert in the world (Sanchez-Lopez 2019). Located only 20 km from Uyuni, this gigantic white desert became a tourist attraction in the early 2000s, especially for backpackers.

These tourists carry everything they need on their backs. They are usually young and traveling on a low budget, sleeping in tents or hostels, and following a flexible route for long periods. Part of the backpacker's style is to seek out "unspoiled" and "authentic" destinations (McCannel 1999), making genuine interactions with the locals. However, there is a gap that exists between the backpacker's "ideology and practice" (Cohen 2004), as I will show later.

In Uyuni, backpackers contact local travel agencies, which offer packages including a standard tour of the southern Andean Altiplano. This lasts three days and two nights and passes through the Salar de Uyuni, colorful lagoons, and an overnight stay in a hotel with walls made of salt. Poorly paid drivers act as guides, and sometimes as cooks, on the 1,000 km journey at extreme altitudes of up to 5,000 meters above sea level.
There are almost a hundred agencies (Quispe and Manuel n.d), offering the same tour, with similar routes and services. Ninety percent of backpackers buy this package, making it the engine of Uyuni's tourism. Some wealthier tourists buy more exclusive packages with different routes and additional activities, such as climbing.

With thousands of backpackers using the same package, the route has become saturated. Hundreds crowd observation points to take the same picture; competition for hotels is fierce; water and sanitation systems are overloaded. However, there have also been benefits to society.

In order to understand the cultural change brought by tourism on Uyuni, I will first consider its history, economy, and local indigenous cultures. I then outline the theoretical and methodological framework that supports this research. Next, I analyze tourism in Salar de Uyuni both from backpackers’ and locals’ perspectives. Finally, I make some general conclusions of this research.

THE HISTORY AND ECONOMY OF UYUNI

Tourists begin their package tour in Uyuni, waking up early to join the car that will take them to all the stops along the route. The first site is the Train Cemetery, a deserted area about 20 km from the center of Uyuni, home to dozens of disused wagons and locomotives. These ghost trains were left to "die", giving the place its name. Now they are exploited by tourists, unaware of the parallels between the cemetery and the history of Uyuni.

Founded in 1889, the city served as a railway crossroad between the trains from La Paz (North), Potosí (East), Argentina (South), and the Port of Antofagasta in Chile (West). Thus, Uyuni was a very important waystation for trains laden with ore and silver from Potosí, heading for export in Chile. With this strategic geographic position, Uyuni quickly became one of the busiest points on the Bolivian railroads.

Life in Uyuni was dictated by the rhythm of the railroad and the national train repair center located in the city. The city's role in Bolivian rail life lasted until the 1990s when various laws and privatization gradually ended many of the functions of the Bolivian Railway Company (Contreras 2017). Trains transported fewer people and were replaced by buses as the country's main form of inter-provincial transportation. However, the transition was slow, as new roads had to be built.

At the same time, the population linked economically to the railroad company lost its function. Many migrated to the Cochabamba department in search of employment. The city emptied and Uyuni lost more than half its population, houses were sold at low prices and many were left empty. It looked like the end for Uyuni.

The changes were also felt in the rural regions around the city, although these people were not connected to the railway. South of the Salar de Uyuni towards the Chilean border, several smaller communities maintain ancestral livelihoods, such as llama and alpaca farming, quinoa planting, and salt mining. Such villages live in ayllus, an Andean form of extended family community with a common ancestry (real or imagined). Ayllus work collectively in a territory in common ownership (Weismantel
2006), keeping alive ancestral myths and rites, and the Quechua and Aymara languages.

The relationship of these autonomous communities with Uyuni is primarily commercial: many travel to the city to buy groceries or sell their agricultural produce at the central market. Therefore, the loss of the railroad affected these populations collaterally, weakening the production chains and the loss of purchasing power of city dwellers.

As the city of Uyuni was emptying, an opposite movement was taking place: adventurous travelers had discovered the city and the region. Even the locals, who feared the Salar and its dangerous desert grandeur, soon realized that this was the most interesting attraction for the foreigners. Many came from Europe or Argentina, staying overnight in a resident's house and convincing someone to drive them to the middle of the Salar.

The number of backpackers gradually increased. The first travelers camped in the Andean highlands, but in 1995 a hotel was built in the middle of the Salar, its walls and beds completely made of salt blocks. It is now a souvenir shop and restaurant and one of the stops on the tour. In 2007, the CNN website was the first to write about the "new destination" for adventure seekers (Bolivian salt lake a new 'must-see' 2007). More salt hotels were built along the shores of the Salar. Over the years, they have been expanded and can now accommodate 300 travelers in the high season.

Major backpacker travel guides such as Lonely Planet and Rough Guides have featured Uyuni. With the advent of internet forums, travelers sought travel tips, agencies, the best time to travel, and what to bring, from fellow backpackers. The surreal pictures taken of the Andean landscapes served as a lure that attracted more and more travelers, making Uyuni a dream destination for young people.

The increase in the number of foreigners arriving every day in Uyuni promoted cultural change, which was felt profoundly by people living in the region. Scholars have not explored these cultural changes, leaving a gap in the literature this research intends to fill.

2 THEORETICAL-METHODOLOGICAL REFLECTIONS

Most doctoral research in the sociology of tourism deals with social impacts (Leite & Graburn 2009; Canosa et al. 2017), especially when investigating tourism in developing countries, such as Bolivia. Under this "impacts of tourism" umbrella is the traditional view that tourism is a form of neocolonialism or acculturation (Cohen 1984). Other approaches deal with the host-visitor relationship and the relations between different ethnic groups (Smith 1989; Barreto 2007).

Within this approach, however, I decided on a broader concept of encounter culture (Santana 2009). This describes a unique cultural combination created from adapted forms of concepts, values, and attitudes of both visitors and hosts. This process happens asymmetrically, with the host cultures providing a bit of themselves, while the visitor culture primarily shapes the encounter. Through this concept, I try to locate precisely how this culture has been changed by a tourist industry that capitalizes on local landscapes, hospitality services, and the knowledge of the city's tour guides.
To follow and understand these changes and the manifestation of this encounter culture, I conducted a three-month ethnography in Uyuni and the surrounding region. I took the tour and conducted in-depth interviews with semi-structured questionnaires with members of various interest groups, such as guides, agency owners, tourists, tourist police, restaurant owners, government officials, and others. The intention was to cover as many perspectives of the local situation as possible, collecting testimonies and memories to help understand these cultural changes (Robinson 1999).

The interviews were accompanied by participant observation in various scenarios of interaction between tourists and hosts. Hosts inevitably treated me like a tourist, which gave me the experience of what it is like to be a visitor at Salar de Uyuni. However, I couldn't be part of the other side, whose view I could only obtain through impressions and reports from local residents, workers, and managers of the tourist industry.

The interviews and the rest of the data collected in the field formed an extensive database of transcripts, photos, field diary, statistical data, and tourism guides published abroad and by Bolivian institutions. I used thematic analysis to work with this data (Souza, 2019), selecting the main codes repeated in all the interviews, which became the recurring themes that make up the core of this research.

3 ANALYSIS

THE SALAR DE UYUNI TOUR

The landscapes of southwestern Bolivia are vast, desert-like regions surrounded by mountains. The city of Uyuni itself is small and has few attractions, despite receiving hundreds of tourists per day. Most arrive by bus and disembark at the dusty street that is considered the city's bus terminal. From there, they leave for the Plaza Arce, a square that looks more like a scenographic city (Galaz-Mandakovic 2014) built for visitors. Its hotels and restaurants serve mostly European and American food, such as pizza, spaghetti, and hamburgers. The price can cost up to six times more than a typical dish in the Central Market, where local families serve soups, chicken rice, and simple salads.

Most tourists only stay for one night in Uyuni or leave the same day for a tour, which they hire from local agencies. The tours leave at 8 am from the agency where the package was bought. At this point, tourists meet their fellow travelers for the next few days, usually young people from other countries, mixing cultures and languages. As previously mentioned, the first stop is the Train Cemetery, where the race begins, as hundreds of tourists compete for space and drivers rush to get their group to the next attraction ahead of the crowds.

This type of trip was described to me by one tourist as a "Japanese tour," a reference to the Asian groups that stop, take pictures, and then leave for the next destination. Another traveler told me that she tried to avoid the three-day tour scheme, but there is no other option for those who lack their own transport. Some cross the Salar by bicycle, motorcycle, or in their own car, but that requires other arrangements that backpackers usually do not have. There are dozens of stops over the three days, so time at each attraction
is scarce, and in the Salar, there are only two stops: the salt hotel and a small "island" covered in giant cactuses. Other stops include more salt flats, colorful lagoons with flamingos, mountains, rock formations, géisers, deserts, among others. The variety depends on the guide, the animation of the group, and the road taken.

The tour also explores the natural beauty of the Eduardo Avaroa Andean Wildlife Reserve (REA), located in the extreme south of the country, on the border with Chile, a protected territory created in 1973 to preserve the unique wildlife that endures such extreme conditions. Almost every group passes through the reserve and each traveler must pay a $15 fee to enter the park. This is the most reliable way to measure tourism numbers in Uyuni, as the park is the only one keeping records of incoming and outgoing tourists.

After the overnight stay in REA, the convoys drive north again, returning to Uyuni. There are fewer attractions on this last day, as the car heads to the town of Colchani for lunch. 25 km from Uyuni, Colchani was founded by families who extracted salt from the Salar. Nowadays, it exists for tourists, who buy souvenirs from a large fair, including local products and llama wool coats imported from Peru.

People bargain all the time in Colchani, a habit that belongs both to locals and backpackers. The initial price is always higher because it is expected that tourists will request a discount. The practice of negotiation happens all over Bolivia, even in services where prices should be fixed, such as bus tickets and hotel stays. However, this constant negotiation creates tensions in the commercial relations between hosts and visitors, as both sides feel exploited.

For example, when I arrived in Uyuni, I stayed in a hotel opposite the bus terminal. When it was time to ask the price, I overheard the hotel owner tell his secretary that he could charge me more because I was a gringa. Of course, he did not know that I speak fluent Spanish. Situations like this are common and make visitors not want to stay in Uyuni for long periods. As one Dutch tourist confessed to me, she "could not wait to leave the city".

Paradoxically, the low prices of the Salar de Uyuni tour are what keep backpackers coming to the city. However, with no central institution to organize prices, tours, and services, both sides resent and distrust their commercial transactions. And there are no genuine interactions between visitors and guests. I will examine this relationship in-depth, looking first at the visitors and then the hosts before finally drawing conclusions on the encounter culture.

BACKPACKERS: “TRAVELERS, NOT TOURISTS”

One of the most important characteristics of tourism at Salar de Uyuni is precisely the type of traveler that this place attracts. Backpackers are generally young people who travel cheaply along a flexible, unplanned route. Research like The Global Nomad (Richards and Wilson 2004) finds that self-identifying backpackers mostly come from Europe and travel to places like Southeast Asia, Australia, and South America.
This style of travel creates what Cohen (2004) calls "the gap between ideology versus practice". In contrast to mass tourism, backpackers desire contact with the local culture because they see themselves as "travelers and not tourists". In theory, they are more willing to stay in accommodation that reflects local culture, consume local food, and are more open to interacting with locals.

However, as the term "ideology versus practice" suggests, there is a gap between this desire and their actual practice. As much as they would like to have different experiences than those of mass tourists, their options are limited. For example, in Uyuni, backpackers have little contact with residents outside of business transactions, especially the Aymara or Quechua people. As a result, many leave Uyuni without any idea of the specifics of the local culture.

After the tour, backpackers usually keep traveling North, towards Machu Picchu in Peru, or South, towards San Pedro de Atacama in Chile. This route is well established and few travelers stray from it, which can be explained by the location of hospitality services, such as hotels and visitor attractions, as well as by the guidebooks they use to plan for their trip.

THE TOURISM INDUSTRY

Despite being Bolivia's most important tourist region, with 50,000 foreign visitors each year, the department of Potosí has the poorest population in the country, even though it generates 45% of its wealth through mining and tourism (Smink 2015). Wealth is concentrated in the hands of a few entrepreneurs and in the case of tourism, agencies, hotels, and restaurants are owned mostly by paceños, Bolivians from La Paz who migrated to Uyuni to work with tourists.

This is the result of how tourism has developed in the region. Families received the first tourists into their own homes. Then, realizing that travelers needed transport, guides, and itineraries from people who knew the roads, the families set up the first agencies and hotels. The owner of the oldest hotel and agency in Tupiza (an alternative starting point for the Salar de Uyuni tour) told me how his family business started: "First there was an Argentinean at the door, and we let him stay, then two came, then one more, and finally we decided to open a hotel". The idea of also opening an agency came later, and today he and his family have a good share of the market in that town.

A tour guide in Uyuni, one of the few with a degree in tourism, told me the same story: "In the beginning, we were afraid to cross the salt flat, but one day a Frenchman came and asked a gentleman from Colchani to take him to see the middle of the salt flat, and that's how tourism started." As more tourists came, more companies were set up to offer them services. Only in 2012 did the Tourism Law No. 247 and National Tourism Plan 2012-2016 begin to standardize and legalize these companies operating without registrations.

Thus, a highly deregulated market now has to deal with government officials and obtain environmental permits to refuel cars. The region's centralizing institutions burden businesses with taxes and licensing requirements, without establishing a fair price and promoting economic sustainability.
National government initiatives are poorly received, without the participation of residents and hosts in their conception.

For example, the Viceministerio de Turismo sent a biologist from La Paz to rate the services of the agencies and guides, establishing the best ones. The initiative discovered the quality of food was one of the most important factors for tourists when choosing an agency. However, the initiative was short-lived. In an interview, the biologist, now the owner of the most popular tourist bar in town, said he woke up one morning to a crowd outside his house demanding he cease his services to the Viceministerio. Thus ended the government's attempt to rank agencies.

The tourism industry in Uyuni and the region is fraught with conflict, often unseen by tourists. The Bolivian government has allocated resources to improve the city's infrastructure, concentrating on major projects such as the paving of departmental highways, especially those connecting Potosí and La Paz to Uyuni.

However, the national and departmental governments have not solved the biggest problems. In an interview, the person responsible for Uyuni's tourism told me the difficulties she faces and how to resolve the many conflicts between agencies, guides, and tourists. One solution would be to include local people in the tourist circuit, while still respecting their conceptions of time and work - the indigenous population is used to the time of crops, with months of heavy work followed by months of waiting.

All interviewees, both from the government and the industry, mentioned the issue of training. There is a university in Uyuni offering higher education in tourism. But many of those hired are attracted by profit, seasonal work, and working several days in a row for cash. Thus, few are trained to deal with tourists and the specific demands of the hospitality industry. At the same time, tourists do not trust the guides. They fear guides may drive drunk and resent that many do not explain the history or geology of the places they visit or their importance to local cultures.

Attempts to control the market have backfired because they have not considered what small business owners need or what tourists demand. By rethinking the development of the tourism industry, we can better understand the cultural changes, the sources of conflict, and how to make tourism more sustainable, both for the entrepreneurs and workers and for the Andean people excluded from the circuit.

4 CONCLUSION: THE ENCOUNTER CULTURE

In light of Santana's (2009) concept of encounter culture and the location analyzed in my research, it is possible to list some unique features of tourism in Uyuni, including 1) a regional economic history linked to the railroad, 2) a destination visited mainly by backpackers, 3) a spontaneously developed and unregulated tourist industry, and 4) the ethnic characteristics of the local population.

The decline of the railroad activities in Uyuni deeply affected how its inhabitants work, live, and move around the country. Unemployment and abandonment were only reversed with the arrival of tourists, who fueled a new service economy that has a stark contrast with the previous one. Where the railroad was
a nationalized, unionized and centralized service, tourism was spontaneous, deregulated, and controlled by agencies.

Tourism in Uyuni was driven by the growing demand of travelers, who discovered its magical landscapes through social networks, word-of-mouth, and print or online media. In response, an agency-run industry emerges, using unskilled drivers as guides and sometimes cooks for groups of up to six tourists.

Low prices and an untrained, poorly paid, and overworked labor force, create big problems. Many tourists complain about drunk drivers and a lack of standardization in signed contracts. In some cases, there have been serious car accidents and tourists have been killed. Cheap tourism feeds a vicious circle where low prices prevent the market from investing in structural improvements and training, despite the desire to offer better services.

Here we reach an impasse. The sense of adventure and isolation, and the low price, make the trip worthwhile for visitors. At the same time, they demand services similar to Western standards, comfortable hotels with piped hot water and European-style food. They desire the isolation of the desert and internet access, at the same time. This is the ideology versus practice of those who identify as backpackers.

In response to demands to standardize services and raise quality, the government has created administrative sections responsible for overseeing the tourist companies. Bolivia's Law No. 247 contains extensive descriptions of what is considered a quality service.

This national attempt of regulation, combined with a decentralized industry, has excluded indigenous communities, who were not able to or did not want to participate in tourism. Many believe they are expected to act as servants for tourists with a low financial return. For them, planting quinoa and raising llamas, seasonal services that conform to centuries-old conceptions of time and labor, may seem preferable and more profitable.

For tourists and those who work in tourism, the consequences are also negative. The fact that hosts and visitors only interact in economic and service transactions makes such interaction superficial. Santana's (2009) so-called encounter culture points to a relationship full of resentment from the locals, who see tourists as a "necessary evil". On the other hand, visitors feel unwelcome and exploited, unable to see the local culture in situations outside of the same hegemonic capitalism they find everywhere else in the world.

Therefore, the cultural changes caused by tourism in Uyuni and the region have been more negative than positive. It is true that the Salar de Uyuni tour prevented the city from becoming another ghost town of the Andean Altiplano, like neighboring Pulacayo. Tourism has revived the economy and put Uyuni on the map of the world's top travel routes.

However, the emergence of an industry that follows Western standards of hospitality brings more harm than good to local populations. Low prices barely allow tour agencies to survive. Tour guides have no training in the area, do not know the region well, and are prone to dangerous behavior, such as driving under the influence of alcohol.

Similarly, tourists suffer from fear of accidents, a lack of a centralized price list, and the guides' lack
of knowledge about the region or a language other than Spanish. In addition, there is a lack of diversity of tourist attractions, so that young people are "stuck" with the standard tour, which almost always offers the same stops. If they want to see different sites and make longer stops in less crowded places, they must pay more. A price that, again, is not controlled by any entity.

However, in my view, the most regrettable aspect of cultural change in Salar de Uyuni is the exclusion of rural communities from the tourist narrative. The lack of projects that promote the local festivals, language, and way of life means that visitors leave without getting to know an ancient culture that was once part of the Inca Empire, survived Spanish colonization, and is part of the uniqueness of the Andean peoples. At the same time, these people are frightened by an industry's demands that do not suit their way of life. Excluded from tourism, they lose out on their share in its profits.

ABSTRACT
This study aimed to present the profile of undergraduate and graduate students of physical education in acting in the areas of education and health. The methodology used for this article was a qualitative approach of academic and descriptive character, aiming to discuss the possible performance of future physical education professionals in the areas of education and health. Results: A total of 78 volunteers participated in the study by answering a google forms questionnaire with open and closed questions and a likert scale variation. It is concluded that physical education students are mostly young males and despite the large number of bachelor graduates, the area of school physical education still seems to be very coveted. On the other hand, there is also an increasing number of people who think of providing care and prescribing physical activities for the health of children and young people in specialized care for people with disabilities and special needs.

Keywords: Academic education, Professional performance, Professional profile, Physical Education.

1 INTRODUCTION
For over a decade the physical education professional is responsible for the practice of supervised physical activity, whether it is applied in basic health care (Rodrigues et al., 2013; Scabar; Pelicioni & Pelicioni, 2012), in leisure proposals (Isayama, 2009) or in basic education (Darido, 1995). In this sense, we understand that this professional acts in mediation, guidance, evaluation, and prescription of exercises, as well as in numerous elements of body culture of movement in different establishments (Massa, 2002).

The professional specialized in working with school interventions is the graduate, as well as the bachelor is the one responsible for working in clubs, gyms, sports training and management of activities in the field of fitness & wellness (Batista, 2015). Regardless of the area of performance/training, we understand that the main objective of the physical education professional is to influence and provide different experiences with the body that can positively impact the individual's health in a biopsychosocial context.

The experiences lived during curricular internships, extension events, and the training curriculum can be essential factors for the success, level of interest, and permanence of these professionals in practice and present numerous scientific productions in recent years (El Tassa et al., 2015; Guirra et al., 2019; Luna & Rocha, 2020; Gama et al., 2020; Rufino; Benites & Souza Neto, 2020).
Analyzing the profile of physical education students is the same as monitoring and recording the future of the profession and subsequently the quality of interventions in education and health. Many studies have been dedicated to the behavioral profile, anxiety disorders, and quality of life of college students in the health area (Conceição Araújo, 2021; Silva et al., 2021; Ferreira et al., 2021). Specifically in the area of physical education and sport science, we observed many investigations on the profile of the sport manager (Nery, 2011; Carvalho, 2013; Barros et al., 2013; Brito; Sarmento & Mulatinho, 2014; Miranda et al., 2017; Sousa Laurentino, 2020; Soares; Teixeira 2020), of consumers of sport-related products and services (Carvalho et al., 2013; Salgueiro & Seixas, 2014) and profile of athletes in different modalities (Pereira; Maior & Ramallo, 2021; Galetti et al., 2021).

Based on the above, it seems that professional profile studies are important for physical education and related areas. However, there are few studies that observe the profile of the academic currently in relation to their area of expertise. Costa, Machado Filho & Soares (2020), suggest that the Covid-19 pandemic may have influenced the choice for the area of expertise of students graduating from the physical education course in order to change their career path and choice.

The information presented so far leads us to the following research question: what is the profile of physical education students and their interest in the area of professional practice regarding interventions in education and health?

To answer the initial research question, our main objective is to present the profile and areas of interest and professional activity of Physical Education undergraduate and bachelor students of higher education courses in the State of Rio de Janeiro. For this, some more specific objectives will be necessary, such as: a) analyze the profile of Physical Education students; b) identify the level of knowledge and interest about the area; and c) categorize the answers obtained and discuss the results.

2 MATERIALS AND METHODS

The present study, following the legal recommendations for research with human beings, sent along with the questionnaire the Informed Consent Form (ICF). In the ICF, the following information followed: This is an academic research of descriptive character, your name will be preserved and never disclosed. Our goal is to research the profile and areas of interest and professional activity of undergraduate and graduate students of Physical Education in higher education courses in the state of Rio de Janeiro. The data collected will be stored and treated according to the CNS resolution nº466 of December 12th. Your participation is very important to us. May we count on you?

This is an academic study of descriptive nature with use of questionnaires containing open and closed questions and variation based on the Likert scale. According to Thomas, Nelson & Silvermam (2012), a research can be considered academic because it has scientific purposes and of descriptive nature, when there is data collection with the intention of quantitatively describing a population or specific behavior.
within a given social context and/or research problem. Data collection was carried out by means of a duly completed questionnaire using the "Google form" tool.

With all the data collected, they were analyzed by arithmetic mean calculations and resulting in the form of percentages of the respondents' answers. The data were classified into six categories: age, gender, area of training (bachelor or undergraduate), the period they were studying, whether they had another degree, and finally, the strongest area for intervention.

3 RESULTS AND DISCUSSION

Students from different institutions (UNIVERSO, UERJ, UFRJ, UFRRJ, CBM-UNICBE, UNICESUMAR, UNIVERSIDADE, UFF, and UNIRJ) participated voluntarily. Initially, a total of 78 Physical Education students filled out the questionnaire sent to them.

After reviewing the responses we received, 7 participants were excluded due to errors in their responses that could compromise the reliability of the study.

Next, the characteristics of the volunteer population will be presented, starting with the age range, which showed great variation (19 to 51 years - see figure 1).

Source: survey data

The available data on gender suggest that there is still a certain predominance of males among studies and future physical education professionals (see figure 2). This is, unfortunately, a naturalized conduct that crosses generations in the areas of physical education and sport (Souza Andres et al., 2012; Prado, 2016; Furtado & Isayama, 2019).
According to the National Institute of Study and Research (INEP [INEP, 2010]), although most of the Physical Education graduates are graduates, in the last ten years it was possible to observe a significant change in this reality. The data presented by INEP corroborate the findings of this research, as well as the findings of Costa, Machado Filho & Soares (2020). Because the number of bachelor's student volunteers is much higher than that of undergraduate students.

The vast majority of the volunteers, which is represented by a margin of 45%, are in 7th and 8th periods of physical education, followed by 11% in 5th and 6th periods, and a little further apart, approximately 5%, are the 9th and 10th period students. Together, they comprise a total of approximately 62% of students who have passed the halfway point of their course. This factor may be associated with greater experience, number of courses taken, extension events, as well as, the largest portion among them has already gone through a mandatory curricular internship period. This contributes to their quality education (Oliveira, 2021).
In addition, the survey data suggest that part of the students, equivalent to 13%, have other higher education. The most common ones are complementary degrees in their own area (bachelor’s and master’s degrees in physical education), but it is also possible to study social work, nursing, journalism, and pedagogy (see figure 5).

As for the areas of intervention, it seems to us that the subjects of the research have some interest in the areas of care for people with disabilities, but there are also large numbers in other areas of health. Such as training for adults and the elderly, with or without specific needs. We believe that this result, as in the study by Costa, Machado Filho & Soares (2020), may have been influenced by the period in which the academies were closed, as well as by the fact that most of the students who are seeking a bachelor's degree had previously attended a bachelor's program.

Furtado and Santiago (2015) also presented similar data, where the school gains prominence in the performance of Physical Education graduates.

4 FINAL CONSIDERATIONS

The present study aimed to present the profile and areas of interest in professional performance through the positioning of Physical Education students in the State of Rio de Janeiro. Based on the research findings in line with the available literature, it was concluded that physical education students are mostly young males (60.6%) and despite the large number of bachelor's degree students (67.6%), for the interviewees, the area of school physical education (66.2%) still seems to be very coveted. On the other hand, the public that thinks about providing care and prescribing physical activities for the health of children and young people in the specialized care for people with disabilities and special needs is also growing (69%).

We emphasize that the data presented here have certain limitations regarding their stratification, such as, for example, the lack of depth on the reasons that led to the option for a bachelor's degree, which reasons lead to the choice for the area of school physical education and not separating the answers by the period that the interviewee was studying. It is likely that the percentage of answers could change according to the variable of the period, because the experience in some subject already studied can change the vision and the taste for the choice. Given the above, it is suggested that new surveys be conducted and that they take into account a sample number that has better representativeness, so as to broaden the view that graduates have about the world of work.

CHAPTER 135

**Socio-environmental impact with inadequate destination of chemical residues Pharmaceuticals: project with alternative of receiving and processing of residues generated by the city of Araruama in the region of lakes of Rio de Janeiro**

**ABSTRACT**

Many pharmaceutical chemical residues (PCR) have shown great potential to pollute the environment, especially in marine habitats. The conjecture stems from direct participation of human beings. Toxicological studies carried with drugs showed the possibility of appearance of physiological sexual alterations already observed in certain species of fish and other marine animals, in addition to the increase of resistant bacteria. In this way, evidence drives the reduction or interruption of exposure to CRP in the environment. The objective of this work is to propose a project to receive expired medicines and other therapeutic products, without use or leftovers from inappropriate uses by several individuals. To achieve these objectives, we will carry out the following methodologies: (i) Conduct a literature review on the subject, to consolidate the problem; (ii) present an advertising plan using social communication vehicles, such as radio, television and social networks, for information and awareness of society about the PCR disposal campaign correctly, using the motto "save the world so you don't lose anyone you love" (iii) To officially request the support of the Municipal Environment Department of Araruama city and the CRF-RJ to standardize and delimit the processing of PCR collected, as a result, several studies were found that indicate and reinforce the socio-environmental impact associated with disposal of PCRs, as well as the evolutionary trend of aggravation of this socio-environmental issue. The introduction of different programs to encourage the proper and rational management and treatment of PCRs with the direct mobilization of different social ties such as the media and especially the different levels of government of the direct and/or indirect administration presents itself as an important tool to achieve of measures that can reduce the social impacts caused by PCRs.

**Keywords:** Drug, disposal, Pharmaceutical chemical residues, environment
1 INTRODUCTION

The National Health Surveillance Agency (ANVISA) reports that the drug is the pharmaceutical product technically obtained or prepared, with prophylactic, curative, palliative or diagnostic purposes. With the increase in knowledge about disease control, multiplication of similar and generic products, dissemination in the media and easy access, there was an increase in the consumption of these products by the population and, consequently, an increase in the disposal of these inputs. Random disposal of expired medicines can lead to extremely relevant environmental impacts. The existence of this type of waste can lead to adverse reactions in aquatic and terrestrial beings (SANTOS et al., 2015).

Medicines when stored must be protected from sunlight, radiation and humidity, realizing that this practice is not known to the population. It is understood that the stock of medicines in households is a very worrying factor for public health, as they are usually not stored in appropriate places and can compromise the stability and effectiveness of the drug, leading to an incorrect disposal of these medicines (SANTOS et al., 2015).

The National Council for the Environment, also known as CONAMA, aims to identify and qualify the disposal of solid waste in the environment. In its resolution nº 358 of 04/29/2005, article 21, solid waste is considered according to the danger it offers health professionals, the environment and the population itself. Among these residues that belong to group B are cytostatic, antimicrobial, chemotherapeutic drugs, among others, and these drugs must undergo a specific treatment and final disposal (FERREIRA, et al., 2015; BRASIL, 2005).

Many PCR have presented great potential to pollute the environment, especially in marine habitats. This conjecture originates through the direct participation of human beings. Toxicological studies carried out with drugs have shown the possibility of the appearance of physiological sexual changes already observed in certain species of fish and other marine animals, in addition to the increase in resistant bacteria. In this way, evidence drives the reduction or interruption of PCR exposure in the environment (DOS SANTOS et al., 2019; DA SILVA et al., 2021).

Changes that make it impossible to use medicines such as: Expired medicines, transfigured due to inadequacies in their storage, in addition to the accumulation of medicines in homes, the known "residential pharmacies", something that is impregnated in the culture of Brazilian society. The Resolution of the Collegiate Board (RDC) nº 306 of 2004, of the National Agency of Sanitary Surveillance (ANVISA), and Resolution nº 358 of 2005 of the National Council of the Environment (CONAMA), recommend that residues of medicines be classified as: chemical residue, which may present dangerous characteristics, requiring differentiated management, as well as adequate treatment. In this way, the objective of this work was to propose a project to receive medicines and other therapeutic products expired, unused or leftovers from inappropriate uses by several individuals. Adherence to the project will be voluntary, both for citizens, for pharmacies.
MATERIALS AND METHODS

The initial stage of the present study prioritized research on the legislation of Brazilian society and the search for information about existing educational campaigns on the official websites of the Ministry of Health and ANVISA. In addition, we carried out a literature review, with an exploratory and descriptive approach. For the study, bibliographic research was used using the Academic google, SCIELO and PubMed databases, a literary review on the subject, to consolidate the problem.

2.1 DATA COLLECT

An opinion questionnaire was applied to collect and analyze responses through a link sent on social networks, from a virtual form on the Google Forms platform, supported by RDC nº 510 of April 7, 2017, respecting all sanitary procedures in force and reason for the COVID-19 Pandemic with a view to social restriction, for individuals residing in the lake’s region, developing methods of analysis of the information collected, through the use of spreadsheets / tables.

Residents of Araruama city were asked the following questions:

1) Do you have a pharmacy at home?
2) Do you usually check the expiration date of medicines?
3) Where do you usually throw your expired medicines away?
4) Have you ever heard any program from your city hall to avoid the incorrect disposal of medicines?

In addition to present an advertising plan using social communication vehicle, such as radio, television, and social networks, for information and awareness of society about the PCR disposal campaign correctly, using the motto “save the world so you don't lose anyone you love”. Officially requesting the support of the Environmental Secretariat of Araruama and CRF-RJ to standardize and delimit the collected PCR processing; All PCR collected in were collected for processing.

3 RESULTS AND DISCUSSION

Different studies were found that indicate and reinforce the socio-environmental impact associated with the disposal of PCRs, as the evolutionary trend for the aggravation of this socio-environmental issue (DA SILVA et al., 2021; eCycle, 2019). For experts, expired PCRs must be processed and treated by thermal actions, usually burned in incineration plants, reducing volume of waste and its danger (DOS SANTOS et al., 2019; DA SILVA et al., 2021). Our results indicated the need to present this project to the City Hall of Araruama, a city in the Lagos Region of Rio de Janeiro. Many steps need to be carried out, as it is a direct administration body, however, we started the project with the proposal to systematize PCRs collections, raising the possibility and offering to the pharmaceutical market in the region the implantation of medicine reception booths and other expired or damaged pharmaceutical ingredients. Additionally, we discussed and indicated different companies in Rio de Janeiro that may have contract for collection and treatment of these PCRs.

Incineration also poses risks to environment and our health, as the gases emitted by burning and the ash produced can contain different toxic substances. This requires extreme control and modern equipment with high efficiency to filter toxic molecules with catalysts that reduce and/or eliminate molecules harmful to the environment. For now, it is the best option for the final destination of health service waste (RSS) - a method also widely used abroad (DOS SANTOS et al., 2019; DA SILVA et al., 2021).

Our questionnaire was answered by (n=52) residents of Araruama. Portraying the world reality according to statistics presented by the WHO and the UN, according to Who et al. (1995) and Aquino (2008), the data from this study indicated that 96.2% of the interviewees, that is, the vast majority, have the habit of storing medicines at home the famous “pharmacinha” Graph 1A. Therefore, reaffirming that the habit of self-medication and the irrational use of medicines are a reality for a large part of the world population, including Brazil. This result is impressive because, although they seem harmless, they represent great harm to the health of society. Factors such as self-medication, incorrect storage, among others, can cause different interactions such as medication and food, including the aggravation of the disease (CUCINELI, et al., 2020).

Briefly, in Graph 1B 80.80% of respondents answered that they check the validity of the medicines they have at home. Additionally, in relation to the disposal of expired medicines, interestingly, most of the individuals who answered the questions (82.70%) confirmed discarding these expired residues in the common waste and only 17.30% said they do not dispose of it this way. These results underscore the importance of this topic for society, especially with regard to the environment.

The presence of chemical agents exposed irregularly in the environment can cause several problems related to the lack of control of plant and animal biodiversity.

These data are broadly similar to those of Casanova et al. (2015), who presented compelling studies establishing a cause-effect relationship associated with environmental toxicology, associating negative
effects caused by the interaction of contaminating chemical agents in the environment with living beings (CANOVA et al., 2019).

Finally, none of the interviewees claimed to know about any government program to collect expired medicines.

Federal Law 12,305, which instituted the National Solid Waste Policy, provides that manufacturers, importers, distributors and traders of any product that may cause damage to the environment or human health must create a collection and final disposal system, regardless of the systems public urban cleaning (BRAZIL, 2010). However, these practices are not common both because the packaging of pharmacological products does not provide instructions on the proper procedure for the disposal of waste and because of the negligence of a large part of the world society (DA SILVA et al., 2021).

In full execution of the project, the aim is to consolidate information on types of PCRs discarded, quantity and financial cost, contribution to the effective implementation of the text published in the Official Gazette of the Union in which it says that pharmacies will have to make available and maintain at least one fixed point collection for every 10,000 inhabitants, in which consumers can dispose of expired or unused household medicines and their packaging (eCycle, 2019; BRASIL 2010).

4 CONCLUSION

Many measures are necessary to reduce and rationalize the actions associated with the disposal and processing of PCRs, however, we need to seek social movements of awareness and respect for the environment and especially future generations. The introduction of different incentive programs for the adequate and rational management and treatment of PCRs with the direct mobilization of different social

CHAPTER 136
Theoretical fundamentals of facing crisis from the perspective of the Pernambuco economy

1 INTRODUCTION

The approach of state participation in the conduct of economic policies, which aims to keep society provided with the necessary resources for its subsistence, raises great controversy. When faced with crises faced, which reduce employment, raise inflation causing a drop in income, among other variables, the discussion of more direct state participation gains greater contours of confrontation of ideas (SICSÚ, 2018). There is a theoretical understanding that not only in moments of crisis, but throughout the monitoring of people's lives, the State must be present to avoid abuse and maintain stability (LACERDA, 2017). There is another line of theoretical thinking, which sees the State as a protector of rights and guarantees, which must be respected, leaving it up to the market to lead to equilibrium, which boils down to a matter of paying for what you want (SOUZA, HOFF, 2019). From a more current perspective, there is a line that allows the State to participate in the pursuit of well-being and also in maintaining the conditions for free enterprise to be exercised (BRESSER-PEREIRA, 2018a).

The present text intends to theoretically evaluate the approach of these State actions, focusing on Pernambuco, in order to establish how such postulates impacted, at different times, the main variables of Pernambuco's economic activity. From the theoretical framework presented and with the indication of the
data collected, we seek to establish a relationship between a more effective state participation, especially in times of crisis, and under their influence, and the observed results, making the due counterpoint with the theory that does not indicate the State as the main actor in the resolution of low moments (LIMA, SICSU, GATTO, 2007; DE ARROXELAS GALVÃO, 2015; LIMA, SICSU, 2019). To this end, the article will be divided into six sections, of which these initial explanations constitute the first.

In the second section of approach, we seek to demonstrate how the theoretical framework of Keynesianism led, due to its specificities, to the thought of the Developmental Theory (BRESSER-PEREIRA, 2018b). Such an approach is premised on the ideals of coping with crises raised for a more effective participation of state action, both at the original moment of the Keynesian theory, when in the models adopted for more than five decades in Brazil, moments in which Pernambuco had an effective participation. (DA SILVA and DA SILVA BEZERRA, 2019).

In the third section, the theoretical framework of Liberal Theory will be exposed, with its specificities of delimitation of state action in conducting the balance of the economic system, even in moments of crisis. The idea of the free market and less state participation will be addressed, in order to expose that such theory does not defend the State as an entity that must be responsible for issues inherent to production, but in guaranteeing the fulfillment of individual freedoms and rights, establishing the State's duties. to do so (KLIASSI, 2018; DE OLIVEIRA, 2019; SOUZA, HOFF, 2019).

In the fourth section, the theoretical framework of the New Developmentalism will be addressed, highlighting its specificities with the current moment and its propositions for the country to get out of the low growth situation, which has a stronger impact on less developed regions, especially in the Northeast, Pernambuco in particular. In the light of theory, mechanisms of state participation are demonstrated in order to develop a consistent industrial policy that promotes the inclusive progress necessary so that crises do not bring great deleterious effects such as those observed in recent years (BRESSER-PEREIRA, 2018b, 2019).

In the fifth section, the approach consists of highlighting the historical behavior of the economy of Pernambuco. From the moment when commodities boomed as the main item of wealth, until the arrival of the new millennium and the beginning of a more sophisticated industrialization. The analysis will focus on the indicators of economic activity, showing the change in the profile of the economy, with the inclusion of modern models of state participation, which privilege public investment as an adjunct in achieving the improvement of indicators of GDP, income, employment, with a focus on the economic improvement of the participation of Pernambuco in the national context (LIMA, SICSU, GATTO, 2007; DE ARROXELAS GALVÃO, 2015; LIMA, SICSÚ, 2019).

In the sixth section, from the comparison of the theoretical framework presented and supported by the data collected, we seek to demonstrate that state participation in facing crises is a fact of fundamental importance, this by way of final considerations. It will be approached in a way that shows that there is a relationship between a greater contribution of public investment materialized in capital expenditures and an improvement in the indicators of economic activity.
From the qualitative analysis of the theory and supported by published data on the behavior of indicators, we try to relate the moments in which there was an improvement in the economic variables in the state of Pernambuco and how this finding can be attributed to state action.

2 FROM ECONOMIC CRISSES AND KEYNESIANISM TO THE DEVELOPMENTALIST APPROACH

Public investment presents itself as a great ally of modern societies to face times of low economic activity. This fact has as its starting point the Keynesian macroeconomic theory of maintenance of economic stability, which advocates the postulate that the State can and must participate in economic activity, in order to promote the maintenance of the stability of the most sensitive economic indicators, as these are that provide the improvement of the general well-being of society, a fact already consolidated in the understanding of public policy makers.

The State has an important responsibility for being a necessary actor to face crises when they are acute, through the implementation of mechanisms to reduce their effects, along the lines of the Keynesian theory of state stimuli to maintain production levels. Keynesian theory advocates that state participation in the economy would bring greater stability and this should always be available when necessary, through the proposition of a reform of the capitalist system, which would give the State a role of coordinator of public policies, in order to combat cyclical market disturbances, which end up compromising the level of consumption, income and employment (DA SILVA and DA SILVA BEZERRA, 2019).

Classical Theory, which can be understood as the mother of Liberal Theory, defended the thesis that the capitalist market system would not generate crises, because there was an invisible hand that would regulate supply and demand automatically. Say's Law already advocated that every supply creates its demand, and that there would be no production crises due to this postulate. What Say's Law spread was the defense that the capitalist system would absorb any volume of production, as it always had an individual demand that would consume what was produced. and who would have to pay for it, given the existing freedom of choice and the crises would not exist, given the capitalist dynamics that would generate an automatic balance (DA SILVA, DA SILVA BEZERRA, 2019).

Despite the classic defense of the free economy of the State, it has been demonstrated throughout successive crises that the issue of public investments is presented as a fact of great importance for the achievement of better standards of development of a country, region, state and municipality. Based on the understanding that the State is a great motivator of economic activity and that this implies making use of its ability to invest to achieve higher rates of social inclusion, it is recognized that effective state participation is an important and necessary condition, as it generates diffusing effects for the private sector, which is even more observed in times of internal and external economic crises (SICSU, 2019).

With the outbreak of the 1929 Crisis, a supply crisis without its respective demand, a theory was needed to respond to the failure to comply with Say's Law, a postulate that advocated that supply creates
its demand, as already mentioned. There was no satisfactory explanation for the excess supply without corresponding consumption. This response consisted of stimulating effective demand, through product activation mechanisms with state participation, as this measure proved to be the right one to maintain production, employment and consumption levels. Stimulating demand proved to be of paramount importance in times of crisis to maintain the level of investment (DA SILVA, DA SILVA BEZERRA, 2019).

State non-intervention in the economy was no longer accepted, as it was up to the State to provide the north for the rebalancing of the economic system. This recognition of state participation as an important entity in economic activity gave rise to the theoretical understanding that the state is indeed largely responsible for better levels of economic development. In entities located in regions that lack infrastructure advances, even more so. It is to recognize that at certain times the State, before being an obstacle, is the one who can guarantee the exercise of free enterprise (DA SILVA, DA SILVA BEZERRA, 2019).

The Keynesian macroeconomic theory, in addition to opposing the postulates hitherto disseminated by the Classics, in defense of Say's Law, brought the understanding that Capitalism is indeed a generator of cyclical crises, generating unemployment of resources. From this starting point, the Keynesian theory presents itself as a support and has as a line of argument to recognize the instability inherent to Capitalism that causes fluctuating changes in the main macroeconomic variables, such as investment, employment, product and income, thus generating cyclical crises. Keynesian theory indicates that Capitalism needs adjustments, such as more active state participation in times of crisis, in order to maintain the appropriate level of investment to meet society's demand (CHAIB, LIMA, 2019).

This need for a more active role for the State was based on finding a solution to the problems encountered in the downturn in economic activity that impacted the level of employment and output in a generalized way. The economic crises of the capitalist system follow one another, in the form of cycles, hence the need for adjustments with the effective participation of the State, for having its autonomy legally guaranteed and thus being able to use macroeconomic mechanisms to rebalance the system, for example, the control capital flows, a controversial measure, but one that appears necessary to be discussed. In this regard, such action is based, in the molds of traditional Keynesianism, recognizing that in addition to keeping the capitalist system functioning, the State must act via macroeconomic policies that seek to mitigate the effects of cyclical crises. Keynesian theory still finds great applicability in times of crisis. These are macroeconomic techniques that aim to bring an economy back to balance, with respect for social inclusion and maintenance of the freedom of private activity (DA SILVA, DA SILVA BEZERRA, 2019).

Keynesian theory brought the importance of state participation in times of crisis and also to regulate production levels in order to meet market inefficiencies. In another moment, it was found that there are middle-income countries that need a greater contribution of state participation in the conduction of economic development, in the molds of the Developmental Theory, in which Brazil is included. This theory argues that, in addition to crises, the State is an important actor in the implementation of public policies to
increase public investment with social inclusion, through national industrialization. The experience of the Asian tigers, which followed a path of participation in public investment, such as Taiwan, Singapore, and South Korea from the second half of the 20th century onwards, should be highlighted (BRESSER-PEREIRA, 2018b).

And from the question of investment and a more effective participation of the State, as an important entity in the process of maintaining the levels of stability of the economy, there is a need to focus with greater emphasis on the Developmental Theory, in a more modern way, where errors of dosage of state participation. This action has as basic premises the interaction between economic growth and productive restructuring in order to generate better income distribution (PRATES, FRITZ, DE PAULA, 2019).

From the recognition that the State has a fundamental role as a participant in economic activity, from the perspective of Developmental Theory, for being an important part in the composition of investments that unlock the variables that will decisively compromise the daily life of the population, comes the need to establish a relationship between employment, investments and the contribution of infrastructure, which represents a fundamental factor. The countries that maintained this policy of state participation as an actor in the economy achieved better rates of social inclusion and a better standard of living for the population, such as the aforementioned Asian tigers, as they managed to balance social investments (education, health) with infrastructure (housing, sanitation, transport), with the private sector as an important participant (BRESSER-PEREIRA, 2018b).

The strategic capacity of the Brazilian State itself is based on participation as a great force in the implementation of public policies, with a focus on investments in infrastructure, and this fact was supported even in authoritarian governments, such as in the military era (KLIASS, 2018). This recognition of the need for state participation, in addition to what has been established by liberal theory, finds greater correspondence when faced with a crisis of international scope, such as the one observed in 2008, which has had widespread repercussions for years. It is the State that can, through its multiplier capacity, mitigate the effects of a downturn in economic activity, as endorsed by the Developmental Theory. From this observation, as a line of economic thought, one must make the due counterpoint with the defenders of the broad market economy, identified in liberal theory (OLIVEIRA, 2018). They are different lines of coping with economic crises, which use different tools and public policies as an instrument for solving the problems brought about by economic cycles.

Developmental theory has already shown that, in other moments of serious crisis in economic activity, the State was a great ally for a more adequate solution and with lower social costs (CURADO, FERNANDEZ, 2018). When faced with moments of crisis such as those faced by the country in the period 2008/2017, when the US Subprime Crisis of 2008 is observed with greater importance and initial term, and, expected as the final term of a cycle, the Recession in Brazil of 2015/2016, which must be addressed with a fundamental emphasis, it is perceived the degree of importance of a more effective state participation in order to maintain adequate levels of public investments.
From the theoretical developmental support and also with the new postulates of the new developmentalism, it seeks to establish an important relationship in the analysis of the proposed decade and thus verify how this fact took place in the State of Pernambuco. Analyzing the theoretical influence of investment decisions rather than supporting the ideas disseminated, characterizes the formation of understandings that remain for application at times of low economic activity, reducing more harmful effects of maintaining the level of well-being of the population, which has the level of employment as a variable of great relevance.

This goes through the issues of investment in investment, where Keynesian theory recommends that the management of public resources must obey the situation that is faced, that is, a moment of crisis, and for that, deficit budgets are allowed, in order to activate the public investment and this generates diffuse benefits in the economy as a whole. To this theoretical support, we must add the complementary aspects of the Developmental Theory, which makes great use of postulates of the Keynesian Theory, highlighting the role of the state as an important actor in the creation of an investment dynamic. The Keynesian Theory and the role of investment financing, with active state participation, requires observing at what point this instrument will be used. Deficit budgets are not necessarily used for public investment to occur, and this must be present as a growth driver in times of high economic activity. In turn, the deficit budget is recognized as a measure of economic recovery in times of crisis according to the postulates of the Keynesian Theory (OLIVEIRA, 2018).

Keynesian investment management policies mitigate the effects of economic crises. Crises bring the need to implement State action measures, so that the deleterious effects do not bring great difficulties to society, especially to the less favored. For the productive sector, there is also a need to guarantee a certain predictability, so that production and jobs are not severely compromised. From this perspective, it is up to the public manager to manage the necessary instruments to maintain an adequate rate of public investment in order to ensure that social indicators do not deteriorate. It is evidence that the participation of the State is fundamental in times of crisis, even if the collection capacity is compromised. The State can generate resources through its ability to create public credit through the mechanisms made available, such as the issuance of government bonds and tax waivers. (OLIVEIRA, 2018). Demonstrating that state-led investment has a great influence in the most serious moments of cyclical crises is based on the fact that developing economies, as in the case of Brazil, which has even less developed regions such as the Northeast, need more effective state participation. , in order to use its ability to stabilize imbalances caused by cycles.

This ability of the State to act as an important actor in activating investment is what can make the economy return to more robust growth rates. It is through the promotion of economic growth that the effect of crises can be mitigated and thus activate important variables that do not let the level of employment fall. The fall in the level of employment of labor and resources is a fundamental cause of aggravation of crises and this has already been consolidated both in the developmental vision and in the liberal approach.
Economic growth is essential to consolidate the improvement in the standard of living of society in developing countries, and the State has a crucial role in this resumption of economic activity.

Thus, one has to:

The resumption of growth presents itself as one of the great challenges for Brazilian society after two years of deep crisis, in 2015 and 2016. After a period of income expansion and inequality reduction in the first decade of this century, strongly influenced by the performance of the world economy and rising commodity prices, we are once again facing recession and its consequences. Recovering investments is something that proves to be essential for the exit from the crisis. (LACERDA, 2017, p.37)

Therefore, it is necessary to revisit the theory that, in a moment of greatest crisis in the history of the world economy, brought solutions that took the sunken countries out of recession. What is advocated is that the State actively participate in public investment again, in order to generate employment and income, and thus move the other sectors of the economy (LACERDA, 2017). The question is how theories applied for a long time have their effects guaranteed if applied today. Developmental theory is bringing new debates about State action within another, more modern perspective, but no less important than the functions already enshrined in consolidated theories, such as the stabilizing function, which has as its basic premise the State's performance as a great responsible for maintaining the stability of the economy, with guaranteed employment without inflation.

This conception of state participation in the economy finds support insofar as the crises caused by the economic cycles signal that they will not be resolved by market mechanisms. Now comes the prospect of returning to traditional economic incentive theories. However, Latin America, especially Brazil, still insists on defending a Liberalism that has brought a lot of imbalance to developing countries. These deleterious reflexes culminated in the 2008 crisis and their effects are still felt today. In Brazil, the 2015/2016 recession is the biggest representative of a succession of crises, ranging from political to economic.

When the performance of economic activity is linked to purely market mechanisms, this ends up generating a disorganization of the national infrastructure, which used to have the State as an ally in times of systemic crisis and now has to face other issues, such as: growth economic, monetary stability, commercial and financial openness, without a defined macroeconomic policy of state action. This dynamic approach to public investments, presented from a perspective of privatization and the like, gave rise to a new vision that transformed economic relations and, with that, impacted the very mode of state action, affecting the ability to implement public policies, since for this, it is necessary to have the State as a partner in the solution of imbalances (MEDEIROS, 2017).

Recognizing the need for the State as an important actor in the economic system, it is essential to clarify that public investment has a prominent role in generating expectations and this translates into an increase in private investment (OLIVEIRA, 2018). The State can, through tax incentives, improve the business environment in the private sector, so as to improve expectations. In this regard, there is a need to
show at what moment the investment ceased to be effective and resulted in the recession faced recently. It should be noted that public investment appears in various periods of crisis as an important element in activating the other variables of the national product, such as savings and consumption. And in this way, the neoliberal vision of facing crises argues that to combat a drop in economic activity, more austerity is needed, mainly fiscal, spreading in the debate through media instruments that the reason for the persistent crisis always comes from the State that has not done its part. (SICSÚ, 2019).

This view of the crisis-causing State is propagated as the ideal solution for its reduction and is supported by the question of associating consumption with something that needs to be restricted, in moments of crisis, by associating this fact per se with the problem of production. This is a way of exempting the State from responsibility for issues of maintaining economic balance in times of crisis, although a theoretical current indicates the opposite, with greater state participation to guarantee balance. Public investment plays an important role in dealing with crises and consumption is a positive factor in the reactivation of economic activity. So:

Labels or slight interpretations give synthetic and simple economic explanations. But, in fact, labels and light interpretations are communication resources that serve the political dispute. Rigorous and in-depth economic explanations can show, in the case in question, facts and results that are different and, sometimes, opposite to those indicated. For example, as shown in this article, what is called “the age of consumption” could more appropriately be called “the age of investments”. Although this last label may be more appropriate for the economy of that period, it would not meet the political narrative of disqualification or the decrease in results achieved, quite the contrary. (SICSÚ, 2019, p.129)

Within this approach, it is intended to highlight a causal relationship between the participation of the State as an important actor in the conduction of the economy insofar as its performance is fundamental in times of crisis. Trying to reduce the role of public investment on the consumption side alone is trying to make use of the rhetoric that state participation was not important in times of economic growth (SICSU, 2019). This fact is unfounded, as the public investment programs in the country in the 2008/2009 crisis period ensured that satisfactory growth rates were maintained. And in this line, it seeks to clarify that not only in direct action as an investor in infrastructure, but also as an incentive for private investment through tax incentive policies,

Thus, this understanding takes into account that one cannot think of public investment without taking into account the participation of the State as a major promoter of development. For BIASOTO JR AND AFONSO (2017) it is possible that there is a need to change the pattern of public investment, but even so, the State, in the case of Brazil, will continue to be an important actor. In the states of less developed regions, even more so, as in Pernambuco, and what is intended to demonstrate is that this more active policy of the State's action as an important entity to combat crises, was what maintained a perspective of social gain that came drawing up pre-crisis.

In a line of complementation of the theory of defense of the participation of the State as an important entity in the maintenance of public investment, the theory of New Developmentalism emerges, which will
be deepened further on. This theory is seen as a renewal of the analysis of developmental postulates, now in a perspective of no longer repeating the premises that proved to be wrong, such as those indicated by EVANS (1993) for different developmental states, but represented a solution as in the case of Brazil, which, despite presenting some inconsistencies in privileges, inherited from a culture that captures the public service by groups of excellence, brought general improvements in the indicators, far from being predatory in the ways disseminated in the theory of the need of the State as a solution. Revitalize Developmental Theory,

The resumption of the Developmental Theory, even with a new perspective, does not remove the initial conception of the recognition that there is a need to search for economic growth and this does not imply the abandonment of an agenda of social inclusion. The measures of the reforms that are implemented, despite having some neoliberal aspect, do not denature the essence of the recognition of the importance of State participation as an important entity in economic activity and capable of establishing a balance between the market and the needs of social inclusion (DE ARAÚJO, 2019).

When the developmental theory was disseminated, it was recognized that in Latin America there was an abyss between the countries of the region and the so-called developed ones. What is still observed today is the need for a country project that can reconcile demands to reduce inequalities, with emphasis on poverty, such as maintaining adequate levels of internal and external competition (DE ARAÚJO, 2019).

Aside from the growth issues, there are the challenges of fighting poverty and the necessary inclusion of disadvantaged segments. In less developed regions even more, which becomes more serious in the Northeast of Brazil. The challenges brought in the external game with Globalization, in addition to the discourse of unbridled liberality of the market, have in their essence an unequal competition, in the sense that it causes great efforts for countries in a situation of unequal productive structure. BRESSER-PEREIRA (2018b), brings an analysis of how the insertion of the country in the concepts disseminated by neoliberalism brought a great imbalance to the Brazilian productive system, increasing the level of social inequality, allied to the fact that it has disrupted the national industry, which is a necessary condition. Insertion of the country in the developed world.

Thus, from the Developmental Theory combined with Keynesianism, what is observed is that in the period from 1930 to 1980, from the mechanisms of action disseminated by these theories, notably the state incentive to industrialization, the country experienced growth rates economic growth, which made it enter the group of middle-income countries, reducing inequalities and entering an important development path. Since 1980, when the country adopted neoliberal postulates for most of the period, satisfactory growth was no longer observed, and this fact stopped the trajectory of social inclusion that had been outlined since the Getúlio Vargas government until the end of the 1970s. (BRESSER-PEREIRA, 2018a).

This loss of inclusive trajectory made Brazil accentuate inequalities, given its continental character, caused by the concentration of income and the loss of the capacity of the national industry to face crises, for not having the State as the main articulator of public growth policies. It is necessary for the State to
participate guaranteeing the freedom of the market, encouraging the real side of the economy, production, setting limits to the rentierism of the financial market. A liberal state for the market and a social state for the population (BRESSER-PEREIRA, 2018b). More social, actively acting in the distribution of income as an essential function, as it is a factor of the essence of the State itself, through the use of its distributive as well as allocative function, attributions that cannot be left to market mechanisms purely,

3 FROM THE NEOLIBERAL VIEW OF STATE PARTICIPATION AS AN INVESTOR

Neoliberalism is defined as a model for conducting economic activity that defends the market, free competition and the freedom of private initiative (SOUZA, HOFF, 2019). Along these lines, a large number of reforms were implemented in Brazil that resulted in the opening of the economy to foreign capital, privatizations, among other measures, on the grounds that state participation as an inducer of growth, in addition to this motivation, ends up creating privileges as it directs resources to the closest, via selected investments. There is no healthy competition in public investments for the defenders of this theory (SOUZA, HOFF, 2019).

After five decades of adopting the developmental model, from 1930 to 1980, and with the oil crises of the 1970s and the outbreak of the debt crisis in the 1980s, with an increase in international interest rates in Brazil's creditor countries, this debt allowed growth financed by foreign investment in military governments, the country abandons developmentalism and enters the Neoliberal Model of economic policy conduction (BRESSER-PEREIRA, 2018a). This fact implied a paradigm shift, as it changed a development strategy with active state participation, for a liberal strategy of reduced state insertion in investment (BRESSER-PEREIRA, 2018b).

As a result of what was observed from the 1980s onwards, there was a worsening of the crises that had already started in the 1970s. These low moments became fertile ground for the proliferation of neoliberal ideas. Within a historical context, it was difficult to maintain the previous developmental model, given the recession that was taking hold in the country. In general terms, based on neoliberal ideas, a return to employment without inflation was promised. When such an understanding is processed, the tendency is to bet on the new economic base, now in a minimal state. This implies a considerable reduction in state participation, as an entity that participates in economic activity and this happens in a generalized way, including investments in goods that are not per se in the interest of private activity.

It is up to the State to guarantee that full market freedom is achieved, with the observance of typical essential functions (justice, police, guarantee of private property). of existing interests. WANDERLEY (2019), along this line, points out:

With regard to the economic process, in the liberal perspective, private property is delegated and the automatism of the management of the economy is delegated to the free market, converging towards economic equilibrium. In the precepts of Keynesian economic regulation, use is made of the active role of money and public spending in the formation of capital stock through fiscal policy management. The main characteristics of neoliberalism involve the adoption of measures that
privilege the freedom of the market at the expense of State action, touting the “minimal State”.  
(WANDERLEY, 2019, p.51)

The fundamental point of understanding is that the market is a dynamic that does not need the participation of the State in order to achieve levels of growth, since the private sector can conduct its investments and from there promote adequate levels of production. It is the State exercising its essential function along the lines of neoliberal theory, which is the non-intervention in economic activity, not even as an adjunct to investment, leaving its responsibility to guarantee the maintenance of stable rules for the coexistence of private interests, not being enough for this to be something large and onerous, but efficient in the conceptions of evaluation of the private initiative.

The neoliberal perspective of state participation in the economy does not see the State as a strategic entity that implements public policies to react to the systemic crises that are observed, these with greater force in less developed regions, such as the Northeast of Brazil, and in this line, the theory The fundamental premise of neoliberalism is that the State must remain attached to its primary role in economic activity, which is established when it allows the freedom of economic agents, thus providing a systematic rebalancing of the economy (KLIASSI, 2018).

Neoliberal theory does not recognize the State as an important entity as an investor, based on premises that have given results in developed countries, which carried out their capitalist revolutions decades ago, and have political and economic stability. However, neoliberal postulates have no application in developing countries, which have the configuration of the Brazilian economy, which needs to solve the national industrialization issue with internal financing (BRESSER-PEREIRA, 2018a).

From a performance with economic policy in which the State had an industrial, developmental policy, with a dynamic of production and improvement of macroeconomic indicators, with an average growth of GDP per capita of 3.8% per year, in the years 1930 to 1980, the country bet on the market to solve its issues of inequality and fiscal crisis, along neoliberal lines. It is the economic policy of non-participation of the State in investment (BRESSER-PEREIRA, 2018b).

The liberal vision of a more effective participation of the State as an important actor imposes limits insofar as there is a crucial point for intervention (WANDERLEY, 2019). This point resides in the guarantee of non-intervention of the dynamics of free enterprise. Private ownership of the means of production is what will, in the liberal view, keep the economic system in balance. This finding is also defended from a perspective of economic crisis. It is argued that the market will naturally bring the balance of economic indicators. Thus, it is observed that:

In this way, the necessary and sufficient conditions for the balanced functioning of the economy are the practices of free negotiation of labor employment, financial deregulation, fiscal balance, monetary parsimony, external trade policy openness, flexibility in mobility international capital, rationality in the decisions of economic agents and many other similar decisions. (WANDERLEY, 2019, p. 51)
The equilibrium of the economy resides in the observance of principles that involve all economic variables. This requires freedom of action for market forces, whether in terms of employment, the financial system, public spending, money supply, international trade opening, incentivized capital mobility, among others. In line with the liberal view, which advocates the market economy, there is an indication that crises must be resolved by market agents (WANDERLEY, 2019).

The privatization of state-owned companies is a representation of this performance. It is argued that the reduction of state participation, via privatization, makes the dynamics of the economic system more efficient by reducing the level of taxation necessary to maintain the state machine, understanding the state active in the economy as an obstacle and not a solution, in addition to such a policy generates resources to balance public accounts (PEREIRA, FERREIRA, 2018).

Even so, there is no guarantee that even in a scenario of little state participation in economic activity, it will per se maintain the level of product and growth to maintain the appropriate level of public policies necessary for the dissemination of general well-being, which is a function essential of the state. Even in an environment where the State acts in a less participatory way, in which the reduction in the number of state-owned companies was observed, there was no more effective assessment that this fact generated confirmable welfare gains (PEREIRA, FERREIRA, 2018). Such evidence is rejected by neoliberals, insofar as they understand that the crucial part of the state non-participation policy is to have the necessary public expenditure control and this does not include state participation as a company.

The liberal instrument for facing economic crises is that of restriction. In turn, in an attempt to implement such a model in a diffuse way, a significant deterioration was identified in the recognized indicators of economic activity in recent periods that culminated in the 2015/2016 recession (PRATES, FRITZ, DE PAULA, 2019). The repercussion of these crises on public investment and which instruments were used by the State of Pernambuco to mitigate their effects is an important fact to confirm that effective state participation can benefit the development indicators of a state, region, country. Even so, Neoliberalism emphasizes that such economic oscillations are momentary and require adjustments in private production, with the State not having an indication of participation to resolve imbalances.

In the defense of Neoliberalism, what stands out is the presence of a State that acts as a regulator. For this theory, a strong state is not synonymous with developmentalism, with a leading role as an investor, but a guarantor of economic activity, creating the necessary mechanisms to encourage investment, even in times of crisis (DE OLIVEIRA, 2019). In this sense, it is observed that there is a tendency to defend a greater liberalization of the economic system, in order to guarantee the rebalancing of the economy's indicators and these will lead to an automatic adjustment form. The participation of the State as an entity that directs economic policies is criticized, gaining new body, with many supporters, the idea of the free market with its invisible hand (DE OLIVEIRA, 2019).

Even so, in the diffusion of neoliberal thinking, there is a line in the defense that state participation in economic activity is allowed, and that includes the debate about an active role in moments of crisis,
which can happen in the form of association, in at times, with private capital. It can also occur by creating regulatory mechanisms in order to generate an environment of protection against identified imbalances, which cause moments of low economic activity. In this regard, it is understood that:

The activist presence of the modern State takes other paths and there are, so to speak, different forms of intervention, just as there are different ways of acting. If we compare developed and undeveloped states, even if they are part of the same globalized world, different instruments of intervention will be found, according to their economic development. Thus, the thesis of the fragility of the national state today is inconsistent, because there is a strong intervention or interference, mainly on the part of developed states in the market economy. Neoliberalism is not building a weak, non-intervening state. On the contrary, it is forming a regulatory State, with direct intervention actions, associating itself with the private sector in some situations. (DE OLIVEIRA, 2019, p.171).

What is advocated as state participation within a more current neoliberalism is its participation as a regulator and how to participate in a form of partnership with the private sector and that for specific purposes. Regulation is a perspective that neoliberalism defends as possible to be exercised in a state form. Neoliberalism advocates that state participation in economic activity is possible, in order to guarantee market balance, but not directly, and when this is possible, it is in an associative and practical way, to the extent of not creating permanent dependence on public resources (DE OLIVEIRA, 2019). In light of this participation, the terminology of the term intervention, for neoliberals, and action for Keynesians/Developmentalists, raises great controversy. In fact, what is intended, from a neoliberal perspective, is to have a strong State that guarantees free enterprise and is in charge of its most essential missions. Regulation is an important function for the State,

Even so, despite already in the 21st century, after 30 years of a mixture of developmentalism (in a very timid way) and neoliberalism, there are defenders of maintaining this economic policy for the Brazilian case. It is clear that the adoption of Brazilian neoliberalism has had harmful consequences for employment, social indicators and per capita income. Brazil is known to be a middle-income country (BRESSER-PEREIRA, 2018b), and adopting a model disseminated by countries that have a very diverse economic structure, which were the cradle of liberalism because they are strong in globalization, because they dictate the rules, is in the reckless minimum, given the condition of competitive inequality. This fact is not recognized by the defenders of neoliberalism, who argue that at a given moment these historical limitations will be overcome.

In the model that included Brazil in neoliberal dictates, it is observed that it brought an imbalance to the national industry and, coupled with this fact, made the rate of public investment fall, so that the effects of economic crises are much more severe. , as observed in the 2015/2016 recession (BRESSER-PEREIRA, 2018b). Recovering public investment is a fundamental factor for the country to once again maintain satisfactory economic growth rates and thus continue its trajectory of social insertion. And at the time when neoliberal ideas erupted with greater vigor, a moment of low economic activity, it was predictable that it would be in search of “successful models” of running the country and this irremediably leads to economic policy. Globalization was already consolidating itself as a new orientation for
international transactions and as such, by multinational companies. The set of measures listed by the defenders of neoliberalism arrived in countries uniformly in the late 20th century. As BRESSER-PEREIRA (2019) pointed out, when he states that:

What happened was more than an ideological change, it was a change in the “policy regime”, or, in broader terms, “the form of economic and political organization of capitalism” from a developmental and social one to a liberal one. This change was profound and soon reached all rich countries, regardless of whether their governments were conservative or social democratic. It made neoliberal ideology dominant in Western societies and neoclassical economics dominant in universities and financial markets. At the same time, commercial and financial liberation, the reduction of transport and communication costs, and the growth of multinational companies strengthened globalization, which became the material expression of neoliberalism (BRESSER-PEREIRA, 2019, p.221)

Regardless of the political nature, neoliberal postulates gained diffusion in the developed world from the 1980s onwards, and in the developing world from the 1990s onwards. It was predictable that neoliberal ideas would find fertile ground in the world. This fact, the economic stagnation that followed the years of more active developmentalism (In Brazil, 1930/1980), was not due to an effective participation of the State in the economy, but because of a mistaken strategy of financing the growth of the economy, country, with emphasis on the “Brazilian Miracle” of the 1970s, which was financed with foreign investment at floating interest rates. Even so, it is not enough fact to exchange a state development strategy for a non-neoliberal strategy, of exclusion from state action as an important actor in a long-term investment policy. (BRESSER-PEREIRA, 2019).

Neoliberal ideas continue as a solution to the problems faced by the country and bring their recipes for coping with crises. What happened was that in the words of BRESSER-PEREIRA (2019) it was that: “Given the economic stagnation and ideological hegemony of neoliberalism, it was not difficult for liberal orthodoxy to attribute the crisis to the strategy of import substitution, that is, to the intervention of the State and the protection of the industrial sector”. Indeed, developing countries faced growth crises in the 1980s.

In the 1990s, neoliberal ideology was reinforced, notably in emerging countries. But despite this fact, the Asian tigers followed their developmental policies, despite crises faced in the 1990s (BRESSER-PEREIRA, 2018b). More recently, in the years 2008 in the world, and later in Brazil 2015/2016, the crises and the recession, put in focus what kind of action was necessary to recover from the stagnation. Neoliberalism in the 2008 crisis in the USA, as in the more liberal European countries (England), used state aid mechanisms to rebalance their economies, contradicting their postulates of coping with crises, which is the market acting in the search for rebalance.

4 THE NEW DEVELOPMENTALISM AS A MODEL FOR COPING WITH CRISES IN BRAZIL

Since the 1980s, Brazil has stopped growing, except for a few specific moments. In fact, since 1980, the country has not grown at the rates necessary to be a developed country. Several factors followed for this fact, in addition to the 1980s of the 20th century, known as the lost decade, the country faced severe
crises in the balance of payments, hyperinflation, public accounts problems, international external debt crisis and, finally, stabilization was reached. economy, at the cost of an overvalued exchange rate and high interest rates internally (BRESSER-PEREIRA, 2018b).

In a more up-to-date view of the theory of State participation as an important actor in maintaining satisfactory levels of growth with social inclusion and market freedom, playing an important role in facing cyclical crises, the New Developmentalism emerges. It is important to point out that the term new developmentalism brings some conceptions that differentiate it from so-called classical developmentalism and, by correlation, with traditional Keynesianism. Based on the performance model itself, it is already possible to establish a fundamental difference. Before, the country needed an industrialization model that reflected the needs of the economy at the time, which was the substitution of imports. Now what is needed is a model that guarantees the maintenance of economic growth based on national industry,

From the recognition of the existence of adverse situations in the international scenario, as well as internally, as advocated in the theory of new developmentalism, which causes an interference of neoliberal dictates in the country's domestic industrial production (BRESSER-PEREIRA, 2018b). This neoliberal action did not bring the expected answers to the question of economic growth expected by the adoption of its models. In the Brazilian case, the growth trajectory of the economy was based on the State as a strong inducer of expansion, a fact that is strengthened in view of the need to manage the fiscal mechanisms of state action to combat crises. In this scenario, the world economic crisis of 2008 brought great repercussions on the capacity to generate public revenues, due to the commitment of budgets with rigid expenses,

Crises already bring an adaptation movement. The State is responsible for a large part of social spending, which requires public investment. The perspective of new developmentalism ensures the maintenance of national industry, via responsible monetary policy, with low interest rates at the domestic level that equal the external rate, and counter-cyclical fiscal policy, via public investment spending (BRESSER-PEREISRA, 2018b), in order to look after national interests, providing the means for private investment in national industry to take place. In turn, in the private sector, crises suggest that it is time for expectations and waiting becomes something more sensible. However, this precaution of private investments ends up compromising the State's own collection dynamics (AMORIM, 2018). It is up to public managers, within this shortage, to

Hence the recognition of the existence of vulnerabilities in the economic system that permeate the prevention capacity that countries have in times of crisis. It is up to the Public Manager, within his line of observation, to offer planning mechanisms and activate public investment, in order to provide a mitigation of the impacts of crises on more traditional economic and social indicators, such as GDP, Employment and Income. From a new developmentalism perspective, it implies an effective participation of the State as an important actor in the process of economic growth, in order to protect the national industry, providing greater predictability in fiscal policy, as well as providing conditions for the export agenda to have a greater presence. asset of higher added value goods, that is, manufactured products produced domestically and
genuinely national, as this fact is a great ally for the country to maintain levels of economic growth, generating employment, income and production. (BRESSER-PEREIRA, 2018b).

In this way, it is necessary to use mechanisms that seek to mitigate the effects of the lack of public revenue on budgets, since these parts, public budgets, have legislative authorization for expenditures that are represented, for the most part, by a binding obligation. This rigidity of public expenditure, mostly represented by current expenditures, ends up compromising capital expenditures in the investment item, and as revenues have a direct relationship with economic activity, which slows down in times of crisis, the cycle is closed. That is, crisis, lower revenue, greater commitment of the mandatory expenditure budget and lower investment due to the reduction of available resources (DWECK, TEIXEIRA, 2018). In the case of federal states, due to their subordination to the Union, the effects of systemic crises cause even more severe impacts on their capacity to invest in infrastructure, via an increase in capital expenditures. From this understanding, it is observed that the participation of the State as an inducer of public investment, despite being paradoxical due to the lack of resources, is necessary and brings the possibility that the effects of the cyclical crises of the economy have their reflexes mitigated. In this line of analysis, Orair and Siqueira explain: is necessary and brings the possibility that the effects of the cyclical crises of the economy have their reflexes mitigated.

Schools of economic thought differ in their analysis of the impacts of public spending or the role of the State as an inducer of economic development. There is, however, widespread recognition of the strategic role that public sector investments can play in our economies, particularly when infrastructure-oriented. These investments are distinguished from most other public expenditures because they result in the accumulation of fixed assets, which potentially increase the public sector's equity and generate a future flow of revenues, in addition to being a macroeconomic variable that exerts simultaneous effects of stimulus on demand and on supply. (ORAIR, SIQUEIRA, 2018, p. 939-940)

It is agreed that public investment has diffuse effects for other sectors of the economy, influencing important variables such as employment, income and GDP. From this perspective, the conception of the State as an important actor in infrastructure investments has a reflex effect that has a significant impact, activating a virtuous cycle in the economy that has repercussions as a whole (ORAIR, SIQUEIRA, 2018). This ability to activate the economy in times of crisis reveals that public investment plays a key role when a decline in economic activity is identified, dampening the most harmful effects observed, especially in states that are less capable of recovery, as they are in less developed regions. as is the case of Pernambuco.

In this regard, new challenges arise and in addition to the cyclical crises, there are internal crises that also impact on the public investment capacity. Allied to the international scenario of economic crisis that took hold in the world from 2008 onwards, which had an important impact on emerging countries, there is also the internal political crisis of 2015, now strong, which culminated in the impeachment of the president. Infrastructure expansion projects were compromised. Exports and domestic consumption were
also impacted, which had been driving the generation of resources to be converted into investment. When the external environment in crisis is faced with an internal crisis, social indicators are the first to deteriorate and the last to emerge from the low, affected by the decrease in domestic consumption.

All these consequences of low activity have a common point, which is the absence of a national project focused on public investment and national industry, along the lines of the new developmentalism (BRESSER-PEREIRA, 2018b). This understanding that the country needs to resume its developmental trajectory, now in a new perspective with emphasis on the protection of national industry, as it must be because this is how the most developed nations followed their paths towards economic balance with social inclusion, is what strengthens a more effective model of state action in guaranteeing a situation of equality in international competition (BRESSER-PEREIRA, 2019). This postulate is possible due to the recognition that the insertion of the country in the neoliberal model, from the 1990s of the last century with greater effectiveness, did not bring the gains expected by society and promised by the market (BRESSER-PEREIRA, 2018b). On the contrary, it plunged the country into successive crises that brought great disillusionment, and these moments of low economic activity indicated even more severe negative results for less developed regions, such as the Northeast of Brazil, Pernambuco in particular.

In the 1990s and following, if, on the one hand, there was a need to control a demand that was repressed and was exposed due to the stabilization of the economy, on the other hand, this fact, recommended by the Washington Consensus (a set of imposed neoliberal practices of emerging economies), brought internal vulnerability in terms of maintaining production and jobs. This combination of pent-up demand with the opening of the economy brought a great expansion of consumption in the stabilization. A priori, the way was paved for the implementation of neoliberal reforms. It is at this moment that state participation in the economy is reduced as a direct action, via state-owned companies. A process of reducing the size of the State begins even more intense than that seen in the previous government (Collor), Policies are also implemented to withdraw the State from economic activity and its regulatory role is strengthened, without acting directly but inspecting privatized services. Regarding this placement, it is observed that:

In fact, the implementation of the Washington Agenda, in the Brazilian context, started belatedly, with the victory of Fernando Collor de Melo in the 1989 electoral contest. The election of Fernando Henrique Cardoso (FHC) for the presidency of the Republic, in 1995, and his re-election for a second term, in 1998, represented the consolidation of the neoliberal agenda in its pillars: economic opening, privatization and deregulation of the State. This is a specific adjustment cycle marked by the stabilization of the economy throughout the 1990s and the threshold of the 2000s. (DE CARVALHO, JÚNIOR, 2019, p.278)

The prescriptions listed for developing countries, especially in Latin America, followed a line that was identified as the cause of all the stagnation that countries were going through at the end of the 20th century and the State was considered an obstacle to be overcome in its size. In the last decade of the 20th century, Brazil entered a policy of unprecedented economic opening (DE CARVALHO, JÚNIOR, 2019).
This fact caused great damage to national industrial production. The successive election of Presidents of the Republic who defended the neoliberal agenda, if on the one hand, brought the stabilization of inflation rates and some fiscal adjustment in the mid-1990s, on the other hand, threw the country into a trap of high interest rates and its corresponding increase in public debt and payment of its services (interest and corrections). With the high interest rate policy, there was a precariousness of the national industry due to the absence of public investments in infrastructure and the financial rentier sector was the main beneficiary (BRESSER-PEREIRA, 2018b). 

Financial stability was achieved at the cost of a large increase in the rentier financial sector. The adjustment was made along the lines of the Washington Consensus, however the State played an important role in investment in Brazil. Public investment has always had great relevance for the country's growth and this is evidenced by the increase in GDP per capita in the period 1930/1980 (BRESSER-PEREIRA, 2018b). The adoption of the neoliberal agenda effectively exposed the country to externally originated crises. The option to have privileged the rentier financial sector over the last few decades through the policy of high interest rates and overvalued exchange ended up harming the economy as a whole.

It is known that there is no interest on the part of the hegemonic countries in the development of the national industry of emerging countries, due to these markets being consumers of manufactured products from these (developed) countries, in addition to being a supplier of cheap labor for multinational industries, and for this reason, they have no interest in advancing national industrialization in emerging countries, Brazil in particular (BRESSER-PEREIRA, 2019). However, the most perverse facet of the ideas spread by the Washington Consensus, as already noted, is the opening of the economy, without safeguards for national industry, for the benefit of a rentier financial elite. This financialization, giving great focus to market mechanisms advocated by liberals, brought destabilization in the accounts of public entities, compromising their ability to make public investment, which is a great ally in dealing with crises, when they happen. Without having an internal productive capacity capable of maintaining jobs and an investment perspective, the effects on the economy are the loss of dynamism due to the reduction of industrial activity in general.

Financialization attracts speculative capital and dismantles production chains. In accordance with the aforementioned Consensus, it follows that: Financialization attracts speculative capital and dismantles production chains. In accordance with the aforementioned Consensus, it follows that: Financialization attracts speculative capital and dismantles production chains. In accordance with the aforementioned Consensus, it follows that:

This subordinate adoption of the Washington Adjustment Agenda, imposed by multilateral institutions – IMF and World Bank – implies a process of deindustrialization of the country and the reprimarization of the Brazilian export agenda, within the scope of macroeconomic policies that transform Brazil into a “platform of financial valuation”, with payment of exorbitant interest in the circuits of financialization of the economy. In this way, the rentier-neo-extractivist adjustment model, in force in Latin America, is outlined and consolidated in the country, taking on marked specificities in the Brazilian context (DE CARVALHO, JÚNIOR, 2019, p.279).
The adoption of agendas established by multilateral bodies, such as the IMF and the World Bank, advocated in the neoliberal mode of condition of the economy, ended up bringing the process of deindustrialization and with it, the loss of dynamism of the national economy, which began to pay exorbitant interest. compared at the international level and impoverished the export whore, limited to commodities and all the instability linked to that fact (DE CARVALHO, JUNIOR, 2019). The insertion of the country through the opening of the economy, by itself, brought great damage to the national industry.

Without strong industrialization, the country ends up transforming itself back into a commodity-exporting country. Allied to the fact that it has an export agenda that does not add much value, despite being also important for bringing in foreign exchange, there is also the fact that the rentier financial sector assumes a prominent role in the Brazilian economy. Without a capital flow control policy, it must be reiterated that this is a necessary debate, there are great disadvantages for emerging countries. Creating the necessary conditions for the recovery of national industry is a challenge that is imposed (BRESSER-PEREIRA, 2012b).

This rentier commodity exporting model, which was largely responsible for the adoption of neoliberal policies since the early 1990s, can be pointed out by the lack of growth in Brazil's economy in the last 30 years (BRESSER-PEREIRA, 2019). This fact significantly affects public policies for social inclusion, public investment and causes great economic vulnerability to face crises. Breaking with this model of unconditional market economy is what indicates that it is the most reasonable solution for the national economy and for the recovery of public investment and the New Developmentalism Theory seeks to reconcile the freedom of the market with the participation of the State necessary to maintain economic stability, with social protection and national industry.

In the case of Pernambuco, demonstrating how capital expenditure behaved in the investment item and the mechanisms to encourage private investment in the period between 2008/2017 is an important fact, in order to clarify whether policies that can be understood as premises of the new developmentalism. This intention has as a point of analysis, the importance of the State as a diffusing element of the improvement of expectations and how this fact was experienced in Pernambuco in the indicated period, taking into account the indicators to be analyzed, the observed multiplier effects and the proven improvements. in the demonstrated economy, through the found indices of improvement in GDP, income, production. In the recovery after the 2015/2016 recession, it is essential to know how government action will be necessary in Pernambuco, in order to maintain the productive capacity of the state. Investments made by the state government must continue to promote the inclusion that was observed through the improvement of social indicators disclosed, as observed in the average income in the years of higher growth.

There is a need to recognize how well-defined public policies, along the lines of the (new) developmental theory, brought important results, so that the fall in economic activity brought about by the crises observed in the period, did not negatively impact the result of economic activity. of State. Thinking
about the dynamics of public investment in Brazil requires that state participation be understood as an important element within a necessary perspective (BIASOTO JR, AFONSO, 2017).

The resumption of an economic policy with a new developmental approach can make the economy return to more robust economic growth rates and thus mitigate regional inequalities (BRESSER-PEREIRA, 2018b). Along these lines, it is identified that: “Recent approaches to developmentalism are characterized in general terms by the objective of combining sustained economic growth with productive restructuring and income distribution, giving the State an active role” (PRATES, FRITZ, DE PAULA, 2019). Within this perspective, in more recent periods, the adoption of a policy more focused on (New)Developmentalism generated the capacity to face crises. Pernambuco has maintained, over the last few years, a participation as a driver of a public policy to attract structuring investments that needs to be maintained.

5 PERNAMBUCO: HISTORICAL CONTEXT, INSERTION OF PUBLIC INVESTMENT AND ITS EFFECTS ON THE MAIN DEVELOPMENT INDICATORS IN THE FACE OF OBSERVED CRISES

The state of Pernambuco, in terms of its role as a generator of production, although based on products in the commodity line, always had a prominent position until the 1970s, when the loss of production dynamism became evident, due to successive crises faced. Allied to this fact, the integration of the other regions of Brazil with the Northeast reinforced this loss of relative importance in the national scenario. This loss of dynamism continues in the second half of the century XX and despite SUDENE having exerted an important influence on structuring projects in the Metropolitan Region of Recife, in the period 1969/1987, these no longer had the same priority, being directed to states such as Ceará, a fact that corroborates the tendency of crises cycles of the Pernambuco economy, first due to the loss of dynamism of products in the local market in the Northeast due to competition from the south axis, and later due to the lack of public funding from the Union via SUDENE (LIMA, SICSU, GATTO, 2007).

And due to the loss of prominence in the national production, when taking into account the Northeast of Brazil, Pernambuco leaves a more prominent position in the national GDP, when it mainly exported sugar, and begins to show drops in production. As explained, from the last quarter of the 19th century to the middle of the 20th century, there was a direction of sugar production to the domestic market to the detriment of exports to Europe, mainly affecting the generation of foreign exchange, and thus generating a smaller expansion of its activity. Economic. Despite lower growth rates, the sugar monoculture made possible mechanisms for a dynamism of the economy, especially in the fields of industrial production of textiles, beverages and food products, due to the possibility of importing industrial equipment generated by the income of the sugar (FROM ARROXELAS GALVÃO, 2015).

It is important to point out, as explained above, that the crisis aspect, as indicated, is a phenomenon present in the national economy. In the Northeast of Brazil it gets worse, due to the little dynamism of the local economy. That was the case with Pernambuco, which has a present mark of cyclical crises since the
time of the colonial economy (LIMA, SICSU, GATTO, 2007). In the first half of the 20th century, the state moved from a prominent position to a more intermediate one, however, it kept economic growth rates still reasonable, even with the change in the direction of production. This fact leads to the understanding that:

In a brief retrospective, the economic history of Pernambuco and the Northeast is that of a succession of booms and crises of their main export crops, which profoundly affected both the plantation areas of the forest zones and those of its vast interior. For reasons whose discussion would go beyond the scope of this work, the Northeast, and especially the state of Pernambuco, entered the 20th century with their export sectors immersed in a deep crisis. As a result of a complex set of causes, the Region had virtually lost, in the late 19th century, foreign markets for its two main export products: sugar and cotton (DE ARROXELAS GALVÃO, 2015, p.133).

The fact that the Northeast, especially Pernambuco, has lost its foreign market to sell its production of primary products (sugar and cotton), as mentioned, has brought significant losses to the maintenance of income and growth. Internally, Pernambuco, throughout the first half of the 20th century, witnessed a process of significant reduction in its ability to transport sugar production to other regions of the country, as did cotton production, as its production was rivaled by others. states, mainly São Paulo and, despite government aid via subsidies, the overproduction crisis hit the Pernambuco sugar industry and with that broke its main source of income (DE ARROXELAS GALVÃO, 2015).

In addition to the absence of an economic growth policy for the states of the Northeast region, Pernambuco, at the end of the first half of the 20th century, had lost all its leading role in the production of sugar and cotton, impacting the local production chain in a generalized way, which had the internal market in the South and Southeast for sugar transport via cabotage and the local textile industry as a consumer of cotton. Due to the loss of gains from the trade of these commodities, first externally (since there was sugar exportation to Europe initially), then internally, due to the assumption of the states of São Paulo and Paraná as the largest producer, the state is faced with a severe production crisis, which has brought a great social cost through unemployment (DE ARROXELAS GALVÃO, 2015).

It should be noted that the state of Pernambuco had a consistent railway system, implemented by an English company (Great Western Railroad Company), which connected the capital to several other locations in the Northeast (Alagoas, Paraíba and Rio Grande do Norte), as well as it had an important road network that took its products to the interior of the state, as well. to other states in the Northeast. In this way, it can be observed that there was in the region, still at the end of the first half of the 20th century, a population of 20 million inhabitants that were supplied within the region itself, by the local industry. It was when in 1949 the Rio-Bahia road was inaugurated, which facilitated the entry of products produced in the Southeast, mainly, and made the products of the Northeast arrive more easily.

Allied to the fact that the state of Pernambuco now counts with the competition of the product of the SOUTH/SOUTHEAST axis, made possible by the opening of the Rio/Bahia road, from the second half of the 20th century, follows the destructuring of the economy of Pernambuco. In the second half of the 1960s, another promising crop in the state entered into crisis, coffee production, which generated important
surpluses as it was a product that was well accepted in the European market. This fact occurred due to a surplus elimination policy provoked by the Brazilian Coffee Institute – IBC, which delimited production and destroyed the surpluses. This fact brought a large wave of unemployment in the producing region (Agreste), causing rural exodus to the capital, aggravating the state's poverty situation. It should be noted that Pernambuco's commodity crops were in a situation of complementarity, each exercising its fundamental and concomitant role in the regions of the state. Sugar in the woods, coffee in the wild and cotton in the sertão generated income and employment in their respective regions. Sugar had greater representation in the Pernambuco economy because it is a product of great national insertion and because it has a more established production structure since the beginning of the state of Pernambuco. The others had their importance, but sugar production was the great locomotive of the state of Pernambuco until the 1950s. From then on, other production sectors began to flourish, albeit incipient.

Despite all the opening observed in the Northeast after the integration provided by the arrival in the region of products from the South and Southeast in the 1950s, due to the new highway interconnection (RODOVIA RIO-BAHIA), which significantly impacted local production, Pernambuco, via tax incentives from SUDENE, experienced economic growth in the 1960s/1970s, practically concentrated in the metropolitan region of Recife. This fact was to the detriment of the more inland regions of the state, which have primary products as the basis of the local economy and for this reason, greater susceptibility in times of crisis, in addition to representing a model that does not bring great expansion of per capita income, because it is not very intensive in terms of productivity and added value, and despite an observed agro-industrial expansion, the fact is that production based on products with little added value makes it very vulnerable to cyclical commodity crises. In this regard, LIMA, SICSU, GATTO (2007), point out as follows:

In the 1960s and 1970s, with tax incentives and other regional policy instruments adopted with the creation of the Superintendence for the Development of the Northeast (Sudene), the Pernambuco economy managed to attract a good part of the investment projects supported by this scheme and thus reach a higher level of industrial diversification, although very located in the Metropolitan Region of Recife. Meanwhile, the interior regions remained very little dynamic and with their economies heavily dependent on primary activities, whether in the Sertão or the Agreste, even though, in some cities in the Agreste, some agro-industrial activities have emerged. (LIMA, SICSU, GATTO, 2007, p. 527)

This understanding that the economy centering primarily on the metropolitan region of Recife, has as a consequence an uneven growth of the state, by virtue of concentrating resources in a certain region and with that, making permanent a growth model that is located. Even so, Pernambuco's average industrial GDP of the industrial sector grew from 1970/1980 at a rate of 10.7%, falling to less than 2% in the period 1980/1999. However, the interior of the state feels the effects of concentration, and today what has been observed over the last few years is an increase in industrial poles, such as the Gesseiro do Araripe, a fact that occurred in the State Development Agencies, a fundamental point of support (LIMA, SICSU, GATTO, 2007). It is necessary that development policies anchored by the State, in the case of Pernambuco,
Still in the 1960s and 1980s, there was a great decline in the industry that had cotton as a raw material, a fact that caused, in the 1980s, the closure of several industries that processed cotton, due to the inability to compete with the Southeast industry, which had more technology and greater scale gains. Allied to the crisis in the textile sector in Pernambuco, there is also the crisis in the sugar and alcohol sector in the 1980s, with the extinction of the Instituto do Açúcar e do Álcool (IAA), putting an end to the policy of subsidies, generating indebtedness for the mills, which led to bankruptcy, of almost half of the production units, strongly impacting the economy of Pernambuco. Added to these structural issues is the fact that a policy of subsidies for the South and Southeast was encouraged to the detriment of the Northeast and North.

SUDENE can be understood as an institution with greater representation of the Developmentalist model. His model also seeks support in Keynesian theory, as it encourages effective state participation in times of crisis and beyond. This institution emerged at a time when the country needed to take a leap of growth, in order to meet the growing social and economic demands via the dynamism of the productive activity of the northeast region, through policies of incentives with the participation of public investment. Such an incentive policy by SUDENE, provided an expansion of Pernambuco's GDP and industry. This fact lasted until the 1980s, when the foreign debt crisis in dollars, oil with its consequences, hyperinflation, allied with the extinction of the IAA (LIMA, SICSU, GATTO, 2007; DE ARROXELAS GALVÃO, 2015). Internally, the lack of financing from the state public bank, given that it had a large liability for rural credit financing not honored by the sugar companies, brought a great blow to the sugar activity. In the 1990s, the federal states were experiencing a major fiscal crisis with indebtedness. As a condition for renegotiating exposed liabilities with the stabilization of the economy, the sale of state banks was required. Access to debt financing resources, as well as more subsidized local production, ends. As of 1994, the neoliberal model of driving the economy is installed, and this has had great repercussions for the federated states.

From the beginning of the 21st century, the economy of Pernambuco began to expand again, indicating the beginning of a new growth cycle, as indicators such as GDP, consumption and income began to show signs of improvement. Despite the maintenance of the neoliberal model of austere control of public spending and high interest rates, after the election of a governor aligned with progressive agendas (Gov. Eduardo Campos) Pernambuco began to experience moments of great growth with industrialization in partnership with the state, in the of developmental theory. Consumption in the Northeast, in particular, was responsible for attracting investment from the industry, as it grew at higher rates than the rest of the country. The paradigm shift in industrial policy had a major impact on this change in the profile of the Northeastern economy. In the case of the Pernambuco economy, there was a trend towards industrialization with projects in the oil, automobile, food industry, among others, which bring productivity gains and income improvement, in addition to the diffusing effects of the surroundings of these enterprises, both local and regional, activating a circle virtuous in the other federated entities of the region. The replacement of the theory of comparative advantages that encourages the natural vocations of the region by the theory that new conditions can be created for a region to develop, was a fundamental factor for an industrial policy to be
incorporated into the economy of Pernambuco. In addition to the diffusing effects of the surroundings of these projects, both local and regional, activating a virtuous circle in the other federated entities in the region. The replacement of the theory of comparative advantages that encourages the natural vocations of the region by the theory that new conditions can be created for a region to develop, was a fundamental factor for an industrial policy to be incorporated into the economy of Pernambuco. In addition to the diffusing effects of the surroundings of these projects, both local and regional, activating a virtuous circle in the other federated entities in the region. The replacement of the theory of comparative advantages that encourages the natural vocations of the region by the theory that new conditions can be created for a region to develop, was a fundamental factor for an industrial policy to be incorporated into the economy of Pernambuco. (DE ARROXELAS GALVÃO, 2015). The adoption of developmental policies to attract investment was important through the granting of tax benefits.

This expansion of the industry in the Northeast Region, in addition to the fact of tax benefits granted by the states, was supported by the improvement in people's standard of living, due to the fact that there was an improvement in income already generated by the stabilization of the economy. Allied to the stable scenario, policies to improve the purchasing power of the minimum wage, income distribution policies for the most needy (family allowance), reduction in the number of family fertility rates (5.8 children fell in the 1970s) for 1.8 children at the end of the 2000s), constituted an attraction for the expansion of industrialization in the Northeast, given the existence of a demand to be met along the lines of the Keynesian theory (DE ARROXELAS GALVÃO, 2015).

What it indicates is that from the 2000s, Pernambuco, through public policies of tax incentives, provided the necessary conditions for the installation of various industrial segments in the state. Tax incentive programs that were implemented, allowing the economy of Pernambuco to have growth rates higher than the country's average (LIMA, SICSU, GATTO, 2007). This fact was due to policies to increase participation in development programs, which were driven by the granting of tax incentives. Despite encouraging the fiscal war between the states of the Northeast, this policy of increasing the economy has proved to be a major factor in detaching the effects of crises faced by states in the wake of national crises. From this perspective, one has to:

In recent years, that is, from 2000 onwards, the economy of Pernambuco, even facing the limitations already exposed, has been performing a little better in terms of relative growth. This, comparing state growth with that of the Brazilian economy, although the average rates have been within the limits of the stunted growth observed in Brazil since the 1980s, that is, 2.4% per year for Pernambuco and 1.9% for Brazil, in the period 1999/2003 (LIMA, SICSU, GATTO, 2007, p. 531).

This observation makes us understand that the State's participation as an inducer of the improvement of indicators, especially in the local GDP, requires a direct participation in order to guarantee a diffusion effect. This fact was observed through a policy of tax incentives that attracted several investments in different segments of the state's production chains. This diversification meant that Pernambuco's GDP
performed better than the national average, above the country as a whole (Brazil 1.9% versus 2.4% Pernambuco). This requires fiscal costs, but it is necessary for a broader effect on society, as in a less developed region, public policies to create conditions for attracting investments can be a feasible way of improving inclusion indicators.

After Brazil's economy grew by 7.5% in 2010, after facing the world crisis of 2008/2009, there was hope that, under the conditions, the time for sustainable growth had finally arrived. In Pernambuco, the government at the time (Eduardo Campos Government) had already started a policy of attracting structuring investments, these same before the crisis, while taking care of infrastructure. It had a great influence on public policies of tax incentives to attract investments with great diffusing potential. These investment attraction policies sought to promote interaction between different segments, such as the productive sector, government and academia. Ogovernment sought to create the necessary conditions for the investment to take place. It sought to emphasize infrastructure, while encouraging the participation of academia and the private sector in generating structuring investments. Along these lines, LIMA E SICSÚ (2019) suggests that:

> With this framework in mind, assessing whether there are conditions, in a given location, for competitive insertion, necessarily involves creating effective conditions for the innovative process and for the search for the new. In this sense, in recent years, the Government of the State of Pernambuco has adopted a strong policy of attracting larger companies, changing the productive matrix of the State. To support this movement and consolidate the economic and innovation dynamics, it is essential to implement a consistent policy, having as parameters the articulation between the productive sector, academic community and government institutions (LIMA, SICSÚ, 2019, p. 182).

Having a policy to attract investments from large companies requires that the necessary infrastructure conditions be created to have a dynamic of competitiveness (LIMA, SICSÚ, 2019). This implies having an interaction between the productive sector that, together with the teaching institutions and government by their institutions, will create the necessary conditions to maintain a consolidated base of production and research, so that investments, public and private, have the return and diffusion effect that is sought when the state entity grants tax benefits.

In the case of federal states, providing public investments requires contributions to capital expenditures. The Investments account represents the generation of assets for the state of Pernambuco, mostly in infrastructure. From the data in Table 1, it can be observed that despite the moments of crisis faced by the state of Pernambuco in the period 2008/2017, an increasing nominal value was maintained in capital expenditures under the heading investments until the year 2013.

As of 2014, the data in Table 1 show that a decline, not so substantial, begins to occur, which coincides with the slowdown of the national economy. In 2015, the drop is dizzying, it grows again in 2016, when the recession begins to dissipate, growing again in 2017, but nothing compared to the previous pre-recession crisis increments. Considering that inflation in the period, which accelerated in the years 2014 and 2015, but nothing that affected the nominal absolute values, there was a considerable loss of public investment in the 2015/2016 recession. Despite the fact that 2014 was a year of little growth in national GDP, with a rate of 0.5%, according to data in Table 2, a considerable volume was maintained in the state of Pernambuco under the heading investments. In 2015, already in recession, with a national fall of -3.5% of GDP,
Graph 1 demonstrates that in nominal terms, the amounts contributed in capital expenditures under the heading investments, returned to the value of 2009 in average terms. This may also imply lower investments by the private sector, as advocated by developmental theory. In this perspective, the national crisis that caused Brazil's GDP to fall in 2015 and 2016 to values of -3.5% and -3.3%, respectively, is added, according to data in Table 2. This fall brings a loss of revenue of the Union, impacting its investment capacity and revenue generation. Without the contribution to revenues, the State Participation Fund also loses resources, affecting the entire financing chain.

When the economy faces a crisis that causes a very sharp drop in activity, all non-mandatory onlending funds are compromised, including national investments. Table 2 shows that the fall from 2014 onwards was very sharp, which requires a longer recovery period. This fall also compromises tax collection, as it causes a decrease in the variable household consumption, as inevitably, a very high recession causes a deterioration in employability rates. The cyclical trend of Pernambuco's economy has already been observed (ARROXELAS GALVÃO, 2015; LIMA, SICSU, GATTO, 2007), but in this situation, in which the decrease was at the national level, it is difficult to maintain public investment standards, due to the very loss of collection capacity.

The state of Pernambuco does not have the money-making machine available in the Union. Even so, the recognition remains that Pernambuco was in a more favorable situation to face the recessionary crisis of 2015/2016, for having created structuring investments (ARROXELAS GALVÃO, 2015). The fiscal incentive policy was largely responsible for this fact, although it is not a model for a country that intends to reduce its inequalities in income and opportunities, as recommended by the Developmental Theory, such a policy is opportune to attract investments when absence of a national policy of production incentives (BRESSER-PEREIRA, 2018b).

In contrast to the final decade, the decade that goes from 2001/2010, there was only one episode of GDP fall and this one in light of the 2008 financial crisis, which was the year 2009, when the Brazilian economy fell -0.1%, according to data in Table 2. From 2000 to 2007, Table 3 shows that Brazil grew, some years more, others less, but it grew, which translates into at least the maintenance of lower unemployment rates. In a situation of at least some growth, it is possible to make some investment, as long as the state entity does not have debt commitments that compromise their ability to honor commitments. Apparently, Pernambuco kept its commitments up to date, not failing to pay its servers, as well as public debt services, as it does not appear on the list of states with delays of suppliers and servers, like Rio de Janeiro and Minas Gerais, nor those of defaulters with public debt services (interest and amortization). Still in the year when the crisis erupted (2008), Brazil grew 5.1% (Table 2). military governments, when the country grew at an average rate of 10% per year). Despite the drop -0.1% in 2009, the title of Milagrinho can be kept for the decade 2001/2010,

In this line of non-maintenance of growth in the finalized decade (2010/2019), based on data in Table 4, it can be observed, even so, that the participation of Pernambuco in percentage terms in the production of national wealth translated into Brazil's GDP, continued on an upward trajectory, falling into
the 2015/2016 recession, starting to experience growth again from 2017 onwards. From 2008 to 2014, in nominal terms, there was a growth of amounts contributed in capital expenditures under the heading investments, a period that coincides with the growing trajectory of participation of Pernambuco's GDP in national production. Maintaining a growing share of national wealth has an impact on the level of employment and income in the region under analysis (SICSU, 2019). Even in the recessive crisis, Pernambuco did not fail to participate, but this fact did not cause the unemployment rate to start to have significant negative jumps from 2015 onwards, as shown in Table 5.

Despite its continued participation in the national wealth, this fact per se did not maintain the level of occupation of the workforce in the recession period (2015/2016). As evidenced in the data in Table 5, at the end of each year, there was a greater worsening in the unemployment rate in Pernambuco in relation to the national level. When it is observed that the increase in capital expenditures on investment above R$ 2 billion started, from 2012 to 2014, the results observed in the unemployment rate go from a difference of 9.2% in Pernambuco against 6.9% Brazil, which represents 2.3%, to 1.1% in the years 2013 and 2014, it is questionable whether the outbreak of the crisis worsened the investment rate and, with that, increased the unemployment rate. This is what is observed in the year of the outbreak of the recession (2015/2016), contribution to capital expenditures in investments of more than 57%, interrupting a growing trajectory of public investments. This fact reveals that in times of crisis, public investment suffers a major setback, when in fact it should be encouraged along the lines of the Developmental Theory (BRESSER-PEREIRA, 2018b; LACERDA, 2017; SICSÚ, 2019).

This is an indication that once an unemployment rate has been reached that detaches itself from the national economy in a greater way, the recovery mechanisms are slower. Despite having contributed increasing resources in capital expenditures in the period 2008/2014, the outbreak of the recessive crisis in the years 2015/2016 led to an increase in the unemployment rate in Pernambuco, which reached a difference

Source: IBGE - National Survey by Household Sample Continuous quarterly
of 5% in the year 2017 compared to the national rate, despite the small recovery observed this year in the national economy. The national unemployment rate was 11.8% compared to 16.8% in Pernambuco. Every effort made by the state of Pernambuco to allocate resources to investment came up against the recessive crisis, which made investments in capital expenditures plummet, a fact that coincides with the rise in the unemployment rate. In subsequent years, 2018/2019, to reduce, but not to the percentages of 2013, when Brazil and Pernambuco had lower unemployment rates, in the amounts of 6.2% and 7.3%, respectively.

In a trend of accompanying the decrease and increase in the unemployment rate in the period 2012/2019, in the period of rise and decline in capital expenditure contributions under the heading of investments, the average labor income, at the end of the periods under analysis, also showed positive variations and negative. From the information in Table 6, it can be seen that in the period of increase in the capital contribution to capital expenditures (2012/2014), there was an improvement in the average income from work in the state of Pernambuco, a variation that coincides with lower rates of unemployment presented. When compared with the Northeast and Brazil, nominally and in percentage terms, Pernambuco showed an approximate increase in average monthly income of 23% in the period 2012/2014. In the same period, the Northeast had an approximate increase of 21% and Brazil an approximate increase of 19%. In the same period, the lowest rates of unemployment in the workforce were observed (Table 5).

Source: SIDRA/IBGE - National Survey by Household Sample Continuous quarterly

The fact that deserves to be highlighted is that as of 2015, average earnings in Brazil and the Northeast continue to grow, at lower percentages than before, as shown in Table 6. In Pernambuco there is a decrease, growing again in 2016. This fact would be a fact important, both nationally and regionally, if the unemployment rate was at the levels of the years 2012/2014. Incomes increased more due to the lower occupancy rate than due to economic growth. Also, once again, the drop in average earnings coincides with the vertiginous drop in capital expenditure on investments that took place in 2015. Graph 2 illustrates the variation in comparative earnings between Brazil, the Northeast and Pernambuco.
In this way, it is possible to establish a list of the beneficial effects of a more effective participation of the State, in this case, Pernambuco, as an investor. At times when there was an increase in capital expenditures in the investment item, an improvement can be seen in the indicators for measuring improvement in the standard of living, such as GDP, income, employment. Also, this observation extends to the percentage maintenance of the share of Pernambuco’s GDP in the national share. The Developmental Theory, in its postulates, argues that this participation of the State as an activator of investments that are not achievable by the private sector for reasons of profitable interest or public interest itself, be carried out in order to activate the other sectors of economic activity. It is to create the necessary conditions for growth.

6 FINAL CONSIDERATIONS

From a historical perspective, it can be observed that the presence of the State as a major player in the growth movements of the Brazilian economy is something that dates back with great relevance since the 1930s. Pernambuco also has its model based on the presence of state action. In more recent years, starting in the 21st century, modern models of state participation were adopted in the state of Pernambuco.
in order to promote the necessary leap to reduce the level of deprivation of society, which gains greater clarity for being a state that is located in a Northeast region of Brazil.

Despite having reached economic stability with the end of the hyperinflationary process in 1994, this fact did not guarantee that the country and Pernambuco were immune to the crises that followed. In 2008 there was an international crisis originating in the USA and more recently the 2015/2016 recession, a period in which there was a great inclusion and income improvement, especially for the less favored, although, mainly in the military governments, it caused more accentuated gains in the richest strata of society.

The Keynesian theoretical framework argues that in times of crisis, such as those faced in 2008 and 2015/2016, more effective state participation is needed, via public budgets, in order to unlock investment and thus generate employment and demand, to consume the production that will be revitalized. It is about activating public financing mechanisms and even in an economy with deficits, this fact is recommended, as it is an initiative that will lead to a new balance. Pernambuco maintained a considerable level of public investments, materialized in capital expenditures, in the post-2008 crisis period, being severely affected in the 2015/2016 recession.

In the 1990s, the Liberal Theory spread in Brazil with the basic assumptions of combating inflationary processes and the search for a free market. At this moment, the State begins to be seen as a problem and the solution lies in removing activities that were considered inefficient and deficient from state control. The international trade opening advocated by globalization, based on the dictates of the Washington Consensus, was a necessary condition. Developmentalism was no longer showing results and hyperinflation was already installed. Inflation was only quelled in the 1994s, and the Collor government was no longer part of the scenario because it was prevented. Pernambuco, like all states, at this time of stabilization, faced problems with its debt, but the then elected federal government, Fernando Henrique Cardoso (FHC), led to refinancing. The end of 2002, despite all the inclusion provided by the stabilization of the economy, what was delivered to the people at the base of the pyramid was very little in terms of improvement in the standard of living, causing a change in the political group and in the conduct of economic policy, severely contractionary. In Pernambuco, this change occurs from 2006 onwards.

In the molds of the Developmentalist theory, the country, based on the most left-wing ideas that began with the government of President Luiz Inácio Lula da Silva (Lula) in 2003, encouraged public investment, which started to play a relevant role and provoked growth rates of economy, after a decade of stagnation, followed by another of very low growth, but, it should be noted, it was not at the same level as in the 1930s/1980s, however it was enough to improve income distribution and the social conditions of the less favored. Even so, it is considered that the period of the Lula government was not entirely developmental, as it maintained high interest rates and overvalued exchange rates to combat inflation, a strategy that became more important than maintaining employment, as indicated by theory. liberal.
In Pernambuco, during the Eduardo Campos government, which began in 2007, there was an even greater improvement in the state's indicators, and its alignment with the federal government was visible, which led to large structuring investments. The 2008 crisis did not have major repercussions for Pernambuco. It can be argued that Pernambuco, from the 2006 onwards, entered a trajectory of economic policy of a New Developmentalist nature. From there, the state gains new dynamics, starts to make large private industrial investments and programs are launched so that public investments in infrastructure create the necessary conditions for the growth cycle to continue. It is possible that for this reason, the international crisis of 2008 did not have so many negative effects on the state. These beneficial effects were being disseminated, when the 2015/2016 recessive crisis broke out, bringing back unemployment, falling incomes and declining public investment. Pernambuco was not oblivious to this national low when it experienced a considerable decrease in capital expenditure on investment. These investments on the part of Pernambuco, which came on an increasing scale, provided a better occupancy rate, an improvement in average income and a stable percentage of GDP. The post-recession period indicates that Pernambuco has new growth with diffuse effects. That came on an increasing scale, provided a better occupancy rate, an improvement in average income and a stable percentage of GDP. The post-recession period indicates that Pernambuco has new growth with diffuse effects.

Principles and Concepts for development in nowadays society - Theoretical fundamentals of facing crisis from the perspective of the Pernambuco economy

1 INTRODUCTION

This work contains data from the ongoing graduation project. It aims to create a collection of patterns to be printed with new laser technology on jeans. These graphic patterns will be elaborated from surface design studies and created based on the art deco decorative elements of the movie The Great Gatsby.

According to Rubim (2010), surface design is every project developed by a designer in relation to the treatment on a surface. It is a technical work, pertinent to creativity and that presents a strong connection with art. For the success of a project, the surface designer must evaluate all the processes involved, from the definition of the color palette to the design of patterns to be applied.

We propose a new use for jeans, with patterns created with laser technology. This technology, which was initially developed to make jeans look worn, according to past trends, can be used with more creativity, which shows and consolidates the present study fully in line with the current trend.

2 THEORETICAL FOUNDATION

2.1 SURFACE DESIGN

Surface Design (SD) appears as a strategy to enhance products. Jones (2010) shows that ancient civilizations had great taste for decoration and ornaments, employed in the most varied surfaces. Ruthschilling (2008) says that from the analysis of these influences, weaving, ceramics, stamping and tiles carry in their visual language the precursor of what today we call DS. In the paintings found in prehistoric caves, the repetition of lines and figures can be observed, establishing a continuity of facts. The tendency
to repetition generates a visual rhythm, which according to Wong (1998) conveys an immediate sensation of harmony.

"Surface Design" became official with the founding of the Surface Design Association - SDA, in 1977, in the USA. It arrived in Brazil in the 1980s, with designer Renata Rubim. It is an area that deals mainly with aesthetic considerations, enhancing the surface of the products in which it is applied.

According to Rubim (2010) for the development of a design (print) on the surface of a product, it is necessary to create a module. Ruthschilling (2008) defines module: the unit that has represented within it all the elements of the design that is repeated to generate patterns. Wong (1998) states that it is possible to create patterns with the element itself, without it necessarily being inserted into a module.

2.2 JEANS

In 1853 Levi Strauss used a type of canvas to make uniforms for workers (PEZOLLO, 2007). However, jeans only became popular among consumers from the 1950s on. In the beginning it presented very different properties: the fabric was thick and heavy, as Catoi (2006) states. To meet the needs of a larger portion of consumers, other lighter weights were developed (OLIVEIRA, 2008).

In the past, jeans were made of cotton fibers only. Today it is made by the flat weaving technique, where the weft is a yarn dyed with indigo dye and the warp is bleached white. According to Udale (2009), this composition guarantees the jeans' resistance. To produce products with fashion value, new fibers were included: polyester, a resistant synthetic fiber, but sensitive to heat, an unfavorable factor for some processes in industrial laundry. Later, stretch jeans appeared, the result of adding cotton to elastane (Lycra®), a fiber with great elasticity and memory (Udale, 2009).

The first processing processes were intended only to soften the jeans. Then there were the processes of aging the jeans, reproducing the natural effects of the pants used by workers (OLIVEIRA, 2008), such as whiskers (markings that simulate the folds of the fabric); stone washed (bleaching effects, beaten with pumice stones, for physical wear of the fabric (CATOIRA, 2006)). About such processes, one can divide them into the wet ones (softened, stone, whitening, resin, etc.), carried out inside the industrial washing machine. And the dry ones, the differentiated processes (fix-pin, laser, puido, etc).

Laser technology, the resource used to reproduce the printing solutions in this project, consists of an invisible beam of light that works by removing (burning) the indigo dye present in the jeans structure, permanently marking the surface. It is more aggressive or softened according to the ideal power of the fabric used, and/or the desired effect. According to Roberto Muñoz, technical director of Jeanology, in an interview with Castro (2014), the laser technology machine reproduces wear among other techniques and dry patterns, or with great water savings, promoting the reduction of impacts to the environment.
2.3 THE 1920S AND THE ART DECO INFLUENCE

The 1920s were revolutionary years and years of great change, according to Braga (2009). "Functionalism" and "Simplification" were the key words that guided the world, especially fashion. A woman with an androgynous look emerged, without curves, small breasts and hips. The appearance of the clothes was tubular, waist shifted to hip height (BRAGA, 2009). The woman allowed herself to show her legs, arms and back, which facilitated the frenetic movements of dances of the decade (GARCIA, 2013).

According to Baudot (2008), the use of jewelry and "trinkets" beautified and modified women's appearance. Short hair was indispensable fashion for women, and had been driven by the fashion designer Coco Chanel. There was a huge repertoire of wonderful and original shapes, and the art deco movement emerged as a way to translate all the opulence. As Dempsey (2003) states, art deco provided the images, the shapes, and the objects that translated the desires of the society of the 1920s, it brought the stylized straight or circular lines, geometric motifs, the zigzag, and the triangle (DEMPSEY, 2003). There is recently a resumption (trend), of the Deco influence by artists, designers, advertisers, stylists, architects, etc. Among the main works developed is the film The Great Gatsby, directed by Baz Luhrmann.

Dempsey (2003) makes it clear how F. Scott Fitzgerald's literary work is one of the works that best describes the 1920s. The film's sets and costumes were designed by production designer Catherine Martin. Renowned fashion magazines, specialized websites, personal blogs, trend bureaus, renowned stylists, and jewelry stores showed the film and all the opulence of the 1920s as an influence for collections and editorials.

3 METHODOLOGICAL PROCEDURES

We used two methods to achieve the proposed result. Regarding the surface development methods, we first used the simplification of elements from a photograph, proposed by Rubim (2010). Subsequently, we applied the method exposed by Wong (1998) of fitting the simplified elements, to develop the stamping solutions.

The technique suggested by Rubim (2010), was used for the generation of alternatives of this project because it is a method that manipulates visual references, which fits perfectly with the proposal of this research, considering that this will make use of the still scene images of the film, to analyze traces and drawings present in it, simplify them and generate the prints. Therefore, for the development of the method, the author uses an image, where one should draw "[...] everything that is visually interesting in terms of shape, composition, rhythm and texture" (RUBIM, 2010, p. 44). Thus, after identifying the references and developing its graphic synthesis, the elements generated from the images will be submitted to repetition studies, proposed by Wong (1998).

Wong suggests making use of variations and combinations between shape elements (drawings), and it is possible to create several shape units, repeating them according to a structure. "The structure serves to control the positioning of the shapes in a design" (WONG, 1998, p. 59). The structure establishes an order
and predetermines the internal relations of form, which guide the design that constitutes the module, and this is always present when there is organization. From this idea of the constitution of a governing structure, and other principles of organization of forms proposed by the author, we set out to create the proposed prints.

4 RESULTS

• Simplification of the elements

We developed the element simplification from a scene image of the movie (Rubim, 2010). According to Wong (1998), the simplified element generates greater possibilities of creation, it was folded changing its degree of rotation, in order to generate a new element, which will be used in the composition of the print.

![Figure 1: Scheme of simplification and folding of the element](image)

Source by the author

• Print Development

The composition was developed on a formal structure and consists of rigidly constructed structural lines, in order to guide the creation of the design. For the desired result, a grid variation called by Wong (1998) sliding was used, where each row of the structure can slide in any direction.
Application in jeans

The print was applied to jeans made of 100% cotton, for best results when exposed to laser burning; which acts on the principle of surface modification of the piece, without altering its volumetric properties. The power of the equipment was regulated appropriately to the fabric composition. The results achieved were extremely satisfactory, with no difficulties in its execution.

5 CONCLUDING REMARKS

To highlight the importance of surface design as an area that interacts with products of all emphases of design, the results achieved are satisfactory regarding the differentiation of the jeans surface. The results were satisfactory, adding value to the products and bringing fashion information to them, bringing new possibilities of differentiation to the traditional jeans made by fashion industries.

As future results it is expected to develop the other prints of the proposed collection, following the same procedures used and exposed in this study, and their consequent application on jeans garments. The development of patterns to be applied on a line of products already manufactured, reflects in the increase of the product catalog. Especially when developed with the use of current trends, it brings familiarization and acceptance of the consumer.

ABSTRACT
Objective: To compare efficacy, safety, and cost-effectiveness of direct-acting oral anticoagulants and vitamin K antagonists in patients with AF and previous stroke. Methodology: Literature review based on a PubMed database search. Conclusion: The decision about which anticoagulant to use in these patients depends on several factors and remains a complex process based on individual patient characteristics.

Keywords: stroke; atrial fibrillation; anticoagulants

1 INTRODUCTION

AF (atrial fibrillation) is the most common cardiac arrhythmia with high prevalence worldwide, on average, patients with AF have a five times higher risk of stroke than patients without AF, regardless of whether they have paroxysmal or chronic AF. AF-related stroke is associated with an approximately 50% increased risk of disability and a 60% increased risk of death within 3 months compared with strokes of other etiologies. These strokes can be effectively prevented with oral anticoagulant therapy.(Jame, 2020)

Most patients with AF have a clinical benefit from OAC, excluding those with AF and no conventional risk factors for stroke. Balancing stroke and bleeding risks is necessary for optimal use of OAC in clinical practice, and modifiable bleeding risk factors must be addressed. Concerns remain about "unmodifiable" bleeding risk factors, such as older age, significant renal or hepatic insufficiency, prior stroke(s) or previous bleeding event(s), and active malignancies. These AF patients are often called "special" AF populations because of their "special" risk profile, which includes increased risks of thromboembolic and hemorrhagic events, and because of the fear of bleeding complications, these AF patients are often denied oral anticoagulation. Evidence shows, however, that the absolute benefits of anticoagulation are the greatest in patients at highest risk.(Freedman, 2016)

Oral anticoagulants vary considerably in their non-clinical characteristics, such as frequency of administration and reversibility of their effect, which are not captured in traditional pharmacoeconomic analyses. Vitamin K antagonists (VKAs) have long been the mainstay of treatment. VKAs have several
inherent advantageous characteristics. They are not eliminated by the kidneys and can therefore be used in patients with severe renal failure. In addition, the need for regular INR monitoring encourages regular doctor-patient contact, even though it is inconvenient and imposes additional costs. However, while regular doctor visits can be beneficial from a medical perspective, poor medication adherence is usually attributable to multiple interconnected factors and there is no evidence that regular doctor visits alone can increase patient adherence. (Collins, 2021)

In the case of a missed dose of VKA, patients are at less immediate risk of a thrombotic event than patients who have not received a dose of DOAC, and non-adherent patients may benefit from the slow shift in action. However, (similar to starting therapy) restarting therapy after missing several doses of a VKA can actually result in a profound pro-thrombotic state. Many physicians are highly familiar with the management and responsible use of VKAs. In addition, the drug costs of VKAs are significantly lower than those of DOACs. Therefore, physicians may hesitate to prescribe any of the DOACs. (Guo, 2021)

On the other hand, they have a narrow therapeutic index, in addition to numerous drug and dietary interactions. The international normalized ratio (INR) requires monitoring to ensure optimal drug efficacy, a fact that accounts for a major proportion of the cost, poor compliance and follow-up, since routine monitoring of anticoagulation confers additional costs such as the cost of the test itself, travel, nursing visits, and missed work. Thus, only 46% of those who should be on VKAs are receiving them, with up to 40% of these outside the ideal therapeutic range of 2.0 to 3.0 INR units, a fact that is associated with increased risk of stroke. (Liberato, 2016) In this context, direct-acting oral anticoagulants (DOACs) have been developed to overcome the limitations of VKA therapy, such as increased risk of intracranial bleeding and the need for continuous monitoring, offering important impacts on the quality of life of patients and their caregivers. Four new agents among these classes, including factor II inhibitors (dabigatran) and factor Xa inhibitors (apixaban, betrixaban, edoxaban, and ricaroxaban), have been approved for these and other indications. (Zirlik, 2017)

The pharmacological characteristics of DOACs offer many practical advantages over VKA therapy. DOACS require no monitoring, have a more predictable pharmacokinetic profile, have fewer interactions with other drugs, and have rapid onset and clearance of action. Direct targeting of factor Xa or thrombin allows a much more rapid and effective anticoagulation effect - within 0.5-4 h and a more rapid shift of action as opposed to the indirect mode of action via multiple coagulation factors, as in the case of VKAs. In addition, the kinetics of DOACs (e.g. rivaroxaban closely mimic those of low molecular weight enoxaparin. Therefore, in contrast to VKAs, bridging with a parenteral anticoagulant is not necessary with DOACs. DOACs also have a much shorter half-life compared to VKAs, making bridging obsolete for interventions or surgery. (López, 2017)

However, its cost is significantly higher than that of Warfarin and its limitations include: class- or drug-specific precautions and contraindications for subtherapeutic dosing, reduced adherence due to lack of regular monitoring, absence or inexperience of drugs to reverse anticoagulant effects, the cost of
maintaining stocks of different anticoagulants, and the potential for prescribing errors due to ignorance. The present study aims to conduct a literature review in order to compare the efficacy, safety, and cost-effectiveness of the two classes of anticoagulants available for the treatment of patients with atrial fibrillation and stroke. (Migdady, 2021)

**2 METHODOLOGY**

Literature review summarizing the main findings using the descriptors "Stroke", "Atrial Fibrillation", "Anticoagulants", in the Pubmed database. The search was conducted on August 20, 2022, relying on the most impactful published articles in the last 6 years of the types clinical study, clinical trial, clinical trial protocol, meta analysis, observational study, randomized controlled trial, multicenter study as inclusion criteria. Publications of case reports, book chapters and studies published in languages other than the selected ones were excluded.

**3 RESULTS AND DISCUSSION**

During the last few years, large studies have been used comparing DOACS with AVKs. A meta-analysis compared efficacy and safety outcomes between DOACs and AVKs, pooling data from observational studies for AF patients with stroke/TIA and intracranial hemorrhage, respectively. Based on these data, we observed that with regard to efficacy outcomes, compared with the use of VKAs, the use of NOACs was associated with reduced risks of stroke (HR 0.82, 95% CI 0.69-0.97; p = 0.02; I² = 84%), systemic embolism (HR, 0.73, 95% CI 0.61-0.87; p = 0.0003; I² = 6%) and death from all causes (HR, 0.7, 95% CI 0.81-0.94; p = 0.0005; I² = 50%). For safety outcomes, compared to the use of VKA, the use of NOACs was associated with reduced risks of major bleeding (HR 0.77, 95% CI 0.64-0.92; p = 0.004; I² = 16%) and intracranial hemorrhage (HR, 0.54, 95% CI 0.38-0.7; p = 0.0006; I² = 21%). There was no significant difference in the rate of gastrointestinal bleeding (HR, 1.13, 95% CI 0.95-1.35; p = 0.17; I² = 40). (López, 2021)

In addition, the GARFIELD study provided temporal information on anticoagulation prescribing patterns as DOAC use increased globally. 60.3% of AF patients in cohort 1 (2010-2011) received any type of anticoagulant increased to 63% in cohort 2 (2011-2013), 67% in cohort 3 (2013-2014) and to 71% in cohort 4 (2014-2015). This overall increase was due to increased use of DOACS and the overall undertreatment of high-risk patients with anticoagulant therapy may be a result of lack of awareness. (Steffel, 2018)

Regardless of the chosen therapy, increasing age and associated complexities, such as comorbidities, and increased bleeding potential, are possible barriers to optimizing anticoagulation. Structured patient support is important to increase safety and effective anticoagulation. For both patients and physicians, confidence and experience of safe anticoagulation were influenced by the presence of comorbidities, poor knowledge and understanding of AF, and the goal of anticoagulation. (Steffel, 2018)
4 CONCLUSION

NOACs represent a significant advance in treatment and when conducting the literature review, studies show non-inferiority of NOACs compared to Warfarin and additional benefits of the such as no need for routine anticoagulation monitoring, reduced drug and food interactions and predictability of drug pharmacokinetic activity. The availability of DOACs provides an alternative management option for patients with AF, especially when the attending physician is hesitant to prescribe a VKA due to associated limitations such as routine coagulation monitoring and dose adjustments, food and drug interactions, and concerns about bleeding complications. Regarding which DOAC is best suited for which patient to maximize safety and efficacy, more prospective real-world data are needed because database studies show divergent results.

The recommendations of the EHRA practice guideline suggest that the choice should take into account not only the clinically relevant characteristics of the patient, but also the patient's preferences. Adherence to therapy is an important factor in achieving better outcomes, and there is some evidence that patients adhere better to once-daily medications compared to those taken twice daily. Identifying how these characteristics interact with broader health processes and systems is a contemporary challenge, and more studies should be conducted to fill these gaps according to the different characteristics of populations.

ABSTRACT
Depression today, faced with the eventualities of life, has become a common and recurrent disease and in order to improve the quality of life or even combat the adverse effects arising from the use of medication, many depressive patients have opted for the use of complementary therapies or alternatives. Thus, the present research had as main objective to present the complementary therapies that have been used for the treatment of depression. For this, an integrative review was carried out with a survey of works in the following data platforms PubMed, Scientific Electronic Library Online (Scielo), Virtual Health Bank (BVS) and Google Scholar. Papers published in the last 5 years in Portuguese, English and Spanish were considered for the research. A total of 15 articles were found through the search and the main therapies used were the use of probiotics, supplements and curcumin, and the performance of auriculotherapy, music therapy, mindfulness, community therapy, yoga, Reiki, meditation, electroacupuncture, acupuncture, aromatherapy, biofeedback, hypnosis, homeopathy, light therapy, massage therapy, dance, spiritual and religious intervention, therapy based on Chinese movements, pilates and aerobic training. In conclusion, it was observed that there are studies that buy the benefits of alternative therapies, however, in view of the great variety of methodologies and samples, more randomized clinical trials should be carried out in order to reaffirm them.
Keywords: Depression; Treatment and Complementary Therapies.

1 INTRODUCTION

Today, depression has become a common and recurring disease in the face of life's eventualities. According to the Pan American Health Organization (PAHO), approximately 300 million people worldwide are affected by this disorder and it is the main cause of disability (PAHO, 2022). The symptomatology related to depression involves sadness and unstable mood that can vary according to its intensity in severe, moderate, and mild pictures (Marese et al., 2019).

Depression can be characterized as a mood disorder that interferes with interpersonal, social, and occupational relationships (Sadock et al., 2017). It can be characterized as mild when the person can perform day-to-day functions without major losses, moderate from the moment that the performance of daily tasks begins to be impaired, and severe when it occurs associated with psychotic symptoms and can lead to the developments of malnutrition or dehydration, or even suicidal ideation (Quemel et al., 2021).

Many depressive patients have chosen to use complementary or alternative therapies in order to improve their quality of life or even combat the adverse effects resulting from the use of medications aimed at the treatment of depression (Warnick Junior et al., 2021). In general, complementary therapies or
integrative strategies comprise actions or practices that are not present in the traditional methods of care for a certain pathology (Silva & Costa, 2021).

Thus, the present research had as its main objective to present through an integrative review the complementary therapies that have been used for the treatment of depression.

2 METHODOLOGY

As a research method, an integrative review of descriptive nature and qualitative approach was proposed. An integrative review is a broader methodology that allows the inclusion of different types of research, experimental or nonexperimental, with the purpose that the studied phenomenon be analyzed and understood (Souza et al., 2010).

Before starting the search, the researchers defined the main and specific objectives of the research, as well as the question to be answered by the study. Thus, to direct the research, the following question was defined: Besides pharmacological and psychological treatment, are there complementary therapies that can be used in the treatment of depression?

The research was conducted between the months of February, March, April, May and June 2022, and the search for articles was conducted in the following online data platforms: PubMed, Scientific Electronic Library Online (Scielo), Virtual Health Bank (BVS) and Google Academic. The following indexed terms were used as descriptors for the search: "Depression", "Treatment" "Complementary Therapies" and "Strategies". The respective translated terms in English and Spanish were also used: "Depression", "Treatment" "Complementary Therapies" and "Strategies"; "Depresión", "Tratamiento" "Terapias Complementarias" y "Estrategias". The prefixes "AND", "AND", "OR" and "OR" were applied to the search as Boolean operators.

In all bases, the filters of time were applied for the selection of studies published in the last 5 years (2017 to 2022), and language for papers published in English, Spanish and Portuguese.

The studies found in the databases were first screened by reading the titles and abstracts. Then, the studies selected from this first screening were read in full and included or excluded according to the eligibility criteria.

Articles that met the following criteria were included:

(I) Participants were people with depression;

(II) complementary therapy interventions or other strategies for the treatment of depression were performed;

(III) controlled clinical trials, randomized controlled trials, case studies, case series, observational studies, and review articles.

Studies that did not present completed results, that is, were not complete, duplicates, and those published outside of the previously established period were excluded.
The following information was extracted from the articles and organized in tabular form: authors, year of publication, type of study, sample characteristics (population, age, sample size), and main results of the studies.

3 RESULTS AND DISCUSSION

The initial search process for studies is delimited by the flowchart shown in Figure 1, and of the 15 articles found, the main information is shown in Table 1.

<td>The effects of all therapies range from low to very high quality due to different types of methodologies, so further studies should be conducted in order to highlight the real benefits of these therapies.</td>
</tr>
</tbody>
</table>
Given the results obtained and presented in Table 1, it was evident that the use of complementary therapies has become over the years a common practice in the treatment of depression. Among the strategies found were: use of probiotic (Haller et al., 2019; Minayo et al., 2021), supplements (Haller et al., 2019; Shamabadi & Akhondzadh, 2021) and curcumin (Ng et al., 2017); and the performance of auriculotherapy (Jales et al., 2019; Corrêa et al., 2020), music therapy, mindfulness, community therapy (Lemes et al., 2020), Yoga (Silva & Costa, 2021), Reiki (Medeiros et al., 2020; Santos et al, 2020); meditation (Kaushik et al., 2020), electroacupuncture (Freire et al., 2020), acupuncture (Hernández et al., 2020), aromatherapy, biofeedback, hypnosis, homeopathy, light therapy, massage therapy, dance, spiritual and religious intervention, Chinese movement-based therapy (Haller et al., 2019), pilates, and aerobic training (Vancini et al., 2017).

It is important to highlight that these complementary therapies can be used by different adult and elderly publics (Corrêa et al., 2020), people with overweight and obesity (Vancini et al., 2017), individuals with other diseases associated with depression (Hernández et al., 2020), drug users (Lemes et al., 2020), people before surgery processes (Santos et al, 2020), among others. And the benefits derived were mainly relief of depression symptoms (Han et al., 2021; Minayo et al., 2021), antidepressant effect (Shamabadi & Akhondzadh, 2021; Silva & Costa, 2021), self-awareness (Medeiros et al, 2020), neutralization of the...
adverse effects of drugs used for the treatment of depression (Kaushik et al., 2020), contribution to well-being (Santos et al., 2020), improvement of mood and self-esteem (Hernández et al., 2020), and positive impact on quality of life (Vancini et al., 2017).

4 CONCLUSION

The present research had as main objective to present the complementary therapies that have been used for the treatment of depression and based on the works found it was evidenced the use of the following strategies: use of probiotics, supplements and curcumin, and the performance of auriculotherapy, music therapy, mindfulness, community therapy, yoga, Reiki, meditation, electroacupuncture, acupuncture, aromatherapy, biofeedback, hypnosis, homeopathy, light therapy, massage therapy, dance, spiritual and religious intervention, Chinese movement-based therapy, pilates and aerobic training.

The main limitation found was the wide variety of methodologies and samples, demonstrating that more randomized clinical trials should be conducted in order to reaffirm the benefits of complementary therapies for the treatment of depression.

Finally, it is suggested that further research be conducted, focusing on a single group of people and searching for a specific effect, so that the assumptions made so far about the benefits of alternative therapies can be confirmed and this type of therapy becomes a viable option for patients with depression.

ABSTRACT

The study of freshwater microalgae is important, as it represents a source of knowledge for the development of innovative technologies, whether through bioactive production or their plasticity in inhospitable environments. This study aimed to evaluate isolation techniques and the taxonomic composition of microalgae in pisciculture ponds, as well as analyze their development in a laboratory environment. Water was collected from the ponds using a Van Dorn-type bottle and filtered through a phytoplankton net (20 µm) for densification. Subsequently, the water was incubated in the laboratory for 28 days in a non-axenic system, with constant aeration and controlled temperature and lighting (22 ± 2.0 °C and 12 h light/12 h dark) to evaluate the algal density and ecological succession of taxonomic groups. Four microalgal isolation techniques were adopted after this period: serial dilution, inoculation on solid medium, selection by aging, and micromanipulation. Fifteen species of microalgae were identified after 28 days of cultivation. The species Lacunastrum gracillimum, Scenedesmus quadricauda, and Chlorella sp. maintained constancy in cell density during the successional period. The technique of streaking on a solid medium was more efficient, with five isolated species of microalgae: Scenedesmus acuminatus, S. quadricauda, Chlorella sp., Monoraphidium contortum, and Scenedesmus bernardii. The other techniques isolated at least one species of microalgae. The ex-situ study of microalgae was important to better understand isolation techniques and their development in a controlled environment, providing essential information to advance research on the use and biotechnological application of microalgae.

Keywords: Isolation, ecological succession, algal flora, pisciculture.
1 INTRODUCTION

The initial and crucial stage of wild microalgae cultivation in a controlled laboratory environment is the identification of potential taxonomic groups and their isolation to obtain a pure culture. The isolation of these microorganisms may be a challenge for many studies, requiring the combination of different techniques for the successful isolation of one or more algal cells (Andersen and Kawachi, 2015; Wojciechowski et al., 2013).

In limnology and marine biology, the term microalgae refer to single-celled algae that grow in fresh or salt water. The term microalgae is not related to the taxonomy of its members, but it designates a polyphyletic group of similar metabolic characteristics that arose and evolved at different times, but with a similar mechanism inside the cells (Andersen, 2013). The group includes green algae, which are eukaryotes, and blue algae or cyanobacteria, which are prokaryotes (Bicudo and Menezes, 2017; Brodie et al., 2017). They are multicellular or unicellular and are similar in many aspects to higher plants, such as the composition of their reserve carbohydrates, proteins, and photosynthetic pigments (Wojciechowski et al., 2013).

The isolation of microalgae in continental freshwater environments has vast biological and taxonomic richness. Their occurrence depends a lot on their adaptive capacity in each environment (Watanabe, 2005). Successful isolation is based on the identification of the species’ biological needs, such as temperature, nutrition, pH, salinity, oxygen, and CO₂ demand. These characteristics can be obtained from the literature, but the knowledge of their performance in controlled laboratory tests can provide important results, as they simulate the optimal adaptive conditions of each taxonomic group (Thompson, 2006).

Several techniques can be used for microalgal isolation, such as separation of cells by capillary action (collection with a glass capillary), serial dilution of the liquid medium, streak plating, photolytic migration (Wojciechowski et al., 2013), and physical separation by centrifugation (Andersen and Kawachi, 2015). Microalgae produce several biochemical substances with high added value (bioactives), which can be used as raw material for fuel, food, and waste treatment, among other applications (Mata et al., 2010; Sirakov et al., 2015; Ansilago et al., 2016; Rizwan et al., 2018).

However, there are several processes to obtain biomass, which include the isolation of potential species and their taxonomic identification, controlled cultivation, biomass recovery, and extraction of the product of interest (Wojciechowski et al., 2013; Rizwan et al., 2018). Cultivation is one of the fundamental stages in microalgae production and the presence of zooplankton and other microorganisms that can contaminate the environment and reduce cell production by predation or competition for resources is common when using wild samples (Carvalho et al., 2012; Ansilago et al., 2016). Thus, the adoption of water filtration using phytoplankton nets or filters that reduce the occurrence of other microorganisms and/or the use of selective antimicrobials are necessary (Grether-Beck, 2008).

Methods of isolation, taxonomic identification, monitoring of environmental parameters, evaluation
of growth kinetics, yield, and harvesting of algal biomass, and evaluation of the ability to grow in residual and contaminated environments need to be studied to extend the microalgae technology (Ansilago et al., 2016; Carvalho et al., 2012). In this sense, microalgae production can be integrated with other production chains to reduce production costs and add new features in addition to biomass production. The inclusion of microalgae at the end of the fish production chain, for instance, may represent an extra income to producers, avoiding environmental problems due to the phytoremediation of effluents and incorporation of microalgae biomass for feed production, which is considered one of the main costs in aquaculture (Borowitzka, 1997; Mendes et al., 2012; Montalvão et al., 2016). It would significantly increase the life cycle of the production chain, raise the quality standard of fish, reduce the environmental burden and, consequently, place the aquaculture system on the sustainability agenda.

Another application of microalgae in aquaculture environments is the direct feeding to other organisms, such as bivalve mollusks and juvenile stages of gastropods, crustaceans, some fish species, and zooplankton (Kaparapu, 2018). Thus, the development of processes that increase microalgae productivity and the expansion of more efficient technologies in biomass recovery may increase the potential for large-scale production and the obtainment of secondary products for environmental pollutant control and remediation processes and many other known applications (Pulz and Gross, 2004; Barcellos et al., 2012).

Despite all the efforts involved in fishing production in the state of Mato Grosso do Sul, Brazil, the integration of the production chain with other sources of income is still emerging, such as the consortium of microalgae production. Also, environmental issues are still neglected in local aquaculture, considering that the production process is considered to have a low negative impact. Therefore, this study aimed to evaluate isolation techniques and the taxonomic composition of wild microalgae in pisciculture ponds to allow the study of cultivation kinetics and ecological succession in a controlled laboratory environment.

2 METHODOLOGY

2.1 COLLECTION AND IDENTIFICATION OF MICROALGAE

The water for microalgae isolation was collected using a Van Dorn bottle (3 L) in canvas pisciculture ponds and filtered in the field with a phytoplankton net (20 µm) for cell densification. Fish production uses a semi-intensive system for raising the Nile tilapia (Oreochromis niloticus) variety GIFT, located in the municipality of Glória de Dourados, MS, Brazil. These collections were carried out in the euphotic zone of the ponds, which have an area of 540.00 m², a depth of 1.65 m, and a density of 7.4 kg fish/m³. The collection period was during the harvest, which is carried out in July (winter), when an average temperature of 20 °C was measured throughout the month, according to the Center for Monitoring Weather and Climate of Mato Grosso do Sul (CEMTEC).

Microalgae were identified according to the following available taxonomic keys: Bicudo and Menezes (2005), Ramos et al. (2015), Souza and Melo (2011), and Sant’anna et al. (2006). Samples were prepared in a Neubauer chamber (hemocytometer) and optical microscope for identification and counting.
2.2 EVALUATION OF THE ECOLOGICAL SUCCESSION OF MICROALGAE

The water collected in the pisciculture ponds was incubated in the laboratory for the development of algal density. The cultures were maintained in 3 1000 mL Erlenmeyer flasks, with a non-axenic static culture system, constant aeration, room temperature (22 ± 2.0 °C), and 2500-lux controlled photoperiod (12 h of light/12 h of dark). The tests were conducted for 28 days, with triplicates taken every seven days and counted in a Neubauer chamber to obtain algal density.

The ecological succession of microalgal taxa was quantitatively studied considering changes in microalgal abundance over time. This analysis was applied to the six most abundant found species, comprising a graphical representation of the relative abundance for each sampling day, calculated by the equation presented by Brower and Zar (1984): \( R_{Nj} = \frac{N_j}{\Sigma N} \), where \( R_{Nj} \) is the relative abundance of a species in a successional period \( j \) (sampling day), \( N_j \) is the species abundance in period \( j \), and \( \Sigma N \) is the sum of the species abundance in all sampling days.

2.3 MICROALGAE ISOLATION

The methods used for microalgae isolation were based and adapted on the methodologies of Pachiappan et al. (2015) and Singh et al. (2015).

1. Serial dilution: performed through successive dilutions aiming to end up with a single cell or at least cells of the same species in a tube.
2. Streak plating: colony formation and easier collection of each colony separately.
3. Selection by aging: induction of competitiveness through the densification of microalgae for a long time (approximately six months).
4. Micromanipulation: collection of larger cells through suction using an inverted microscope through microcapillary tubes and inoculation on agar medium.

2.4 MICROALGAE MAINTENANCE

The isolated microalgae were cultivated in NPK synthetic liquid (Carvalho et al., 2012) and solid media. The liquid culture medium was prepared using a synthetic medium with 1% NPK stock solution. The NPK stock solution was prepared by adding 70 g of N:P:K chemical fertilizer (20-5-20 g L\(^{-1}\)) into 1000 mL of distilled water, followed by autoclaving at 121 °C for 20 minutes (Sipauba-Tavares and Rocha, 2003). The solid culture medium was prepared using 1% of stock solution and 10 g of bacteriological agar in 1000 mL of distilled water, followed by autoclaving at 121 °C for 20 minutes and the addition to Petri dishes for streaking of samples with microalgae. The plates were maintained in a BOD with a non-axenic static cultivation system, constant aeration, and controlled temperature and 2,500-lux photoperiod (22 ± 2.0 °C and 12 h of light/12 h of dark) for 28 days. The plates were subcultured every fifteen days.
2.5 Data Analysis

The Levene test was applied as a prerequisite to verify the data homogeneity. One-way analysis of variance was adopted to verify a significant difference at the 5% probability level in the cell density between the main species of microalgae cultivated by sampling period (seven-day intervals), followed by the Tukey’s test. The analyses were carried out in the statistical software GENES version DOS (Visual Basic 5.0).

3 RESULTS

Fifteen species of microalgae were identified after 28 days of inoculation of water collected from pisciculture ponds. The slicing of the taxonomic composition and mean cell density of these microalgal species are shown in Table 1. The cyanobacterium *Aphanocapsa annulata* had significantly higher cell density than the others, followed by the chlorophytes *Chlorella* sp. and *Lacunastrum gracillimum*, which also differed significantly from the other microalgae (10.75, 7.06, and 4.47 × 10⁵ mL⁻¹, respectively). Figure 1 shows the intrinsic morphological differences of each sampled species of microalgae.

</table>

Means followed by the same letter in the column do not differ statistically from each other by the Tukey’s test at the 5% probability. F: 29.4817; LSD: 2.96981; P: <0.05.

The ecological succession patterns of the six most abundant species of the phylum Chlorophyta during the 28 days of cultivation were as follows: the microalgae *L. gracillimum* and *M. contortum* presented significantly higher cell density-dominance at the beginning of the successional period (1 to 7 days of inoculation), while low density and little dominance among the taxa were observed in the final periods (21 to 28 days of inoculation); in general, microalgae show a decrease in cell density on the 14th day during the successional period, followed by a low recovery on the 21st day (Figure 2). The cyanobacterium *A. annulata* was not considered in this analysis as it is not of interest in bioprospecting.
Cell isolation techniques were analyzed after evaluating the taxonomic composition of microalgae and their growth kinetics. The techniques adopted in this study allowed the isolation of 1/3 of the identified species: *Chlorella* sp., *S. acuminatus*, *S. quadricauda*, *M. contortum*, and *S. berna*rdii. The streak plating technique carried out on solid medium (agar) allowed the isolation of a higher taxonomic diversity; the microalgae *Chlorella* sp. was isolated in all techniques, including selection by aging, proving to be a taxonomic group with a high potential (Table 2).

**4 DISCUSSION**

The cyanobacterium *A. annulata* presented the highest cell density. These prokaryotes are widely distributed in eutrophic environments, where they can commonly form toxic blooms (Rosini et al., 2013; Nogueira et al., 2011). These microorganisms have an excellent adaptive capacity due to their morphological and physiological characteristics, being able to colonize different environments such as soils and inside rocks, but they are commonly found in aquatic environments (Calijuri et al., 2006). The species
A. annulata was found in at least seven pisciculture ponds among the ten sampled in a study conducted by Rosini et al. (2013). This species occurs in colony, microscopic, or macroscopic forms, with a colorless and homogeneous mucilaginous envelope and division by binary fission (Bicudo and Menezes, 2017). Cytomorphological, structural, and morphometric characteristics, such as size, shape, and aggregation of cells, presence of mucilage, and mucilage sheath, evidenced by India ink (Calijuri et al., 2006), were observed for the identification of these organisms. The bioprospecting of this group is of little interest due to its toxic potential despite its high representativeness.

In contrast, eukaryotic microalgae of the genus *Chlorella* had the second-highest cell density. These microalgae have spherical cells and mainly inhabit still-water plankton (Bicudo and Menezes, 2017). *Chlorella* has a high concentration of carotenoids, antioxidants, vitamins, proteins, and fatty acids, being widely used in the production of biofuels or as a food supplement (Morais-Junior et al., 2020). The microalgae of the phylum *Chlorophytina* have been widely used in wastewater treatment trials and other biotechnological studies (Peng et al., 2017; Leong et al., 2018; Moreno-Garrido, 2018; Saavedra et al., 2018).

The species *L. gracillimum* and *P. duplex*, belonging to the family Hydrodictyaceae, presented intermediate cell density. The genus *Lacunastrium* is generally constituted by four, eight, or even sixteen cells, which have lobes with elongated processes, in addition to forming flat colonies, and intercellular spaces usually larger than the cell diameter, with cell walls normally smooth (McManus et al., 2011). Representatives of the genus *Pediastrum* are also composed of flat, more or less circular, free-living colonies, containing at least four cells and reaching 128, always a multiple of two (Bicudo and Menezes, 2017). The importance of isolating this group is the focus of many studies due to the fossil record of at least some members (Buchheim et al., 2005). In addition, the group has undergone taxonomic revision with advances in molecular and genetic techniques, making it necessary to expand the understanding of the ecological niches occupied by particular morphotypes and improve its indicator value for reconstructing past climates and biotypes (McManus et al., 2011). However, the application of *L. gracillimum* and *P. duplex* in production processes was not observed in the literature.

The genus *Scenedesmus*, represented mainly by the species *S. acuminatus*, also showed an intermediate cell density. The group is the most common and cosmopolitan of the green algae genera, forming flat colonies of 2, 4, 8, 16 or, more rarely, 32 cells arranged side by side, with their longest axes parallel to each other (Bicudo and Menezes, 2017). The genus is cited in the literature as a potential source for phycoremediation of wastewater (Dickinson et al., 2013; Prandini et al., 2016; Shivagangaiah et al., 2021) and combined lipid production (Pham et al., 2020), as well as a source of antimicrobial and anticancer compounds (Marrez et al., 2019). These applications justify the isolation of pure strains in controlled environments.

The ecological succession analysis showed that the microalgae varied in relative density during the 28 days of inoculation. However, a common pattern found for all microalgae was a decrease on the 14th
day, followed by recovery on the 21st day of cultivation. This pattern in microalgal growth kinetics can be considered as a period of adjustment to the culture medium and has been observed in other studies (Carvalho et al., 2012; Ansilago et al., 2016, 2021). According to the authors, this pattern may be directly related to the disposition of nutrients from pisciculture water by cell lysis of the present phyto. The growth kinetics in cultures where the medium is added according to the requirements of the microorganisms occurs as follows: growth latency, acceleration, logarithmic growth (balanced growth), deceleration, stationary phase, and, finally, the death phase (Vonshak, 1993).

The lack of a dominance pattern for one or another microalga taxon during the successional period was an indication that the culture medium worked close to the limiting nutritional factors for both groups. This inference may be evidenced by the relatively low density from the 14th day of cultivation for all groups, suggesting a nutritional availability below the optimum. The supplementation of the culture medium would be necessary in case of biomass production, thus increasing the cell density and promoting cell maintenance for more than 14 days of culture. The density of the present study was much lower than expected compared to studies conducted by Carvalho et al. (2012) and Ansilago et al. (2016, 2021).

Chlorophyceous microalgae are known to have high abundance in fish-farming systems, while cyanophyceous microalgae have higher dominance, as these systems tend to eutrophication (Macedo and Sipaúba-Tavares, 2010). The genus *Chlorella* sp. showed a more constant density over the 28 days among chlorophyceous microalgae. According to Townsend et al. (2010), this pattern follows the premise of ecological succession, in which taxonomic groups dominant in density and occurring throughout the successional period would be more suitable for large-scale production, as they adapt more easily to natural or artificial cultivation media, besides being more resistant to medium variations and the presence of other species through competition. Another aspect of great importance despite the indications of the advantage of the genus *Chlorella* regarding the results of the ecological succession is the potential for cell isolation that the groups offer relative to the available techniques.

Inoculation on solid medium was the isolation technique that achieved higher diversity of taxonomic groups of microalgae in this research. This technique allowed isolating five promising species for bioprospecting, among them the genus *Chlorella* sp. The isolation technique on solid agar medium consists of inoculating an aliquot of the sample with microalgae in a Petri dish containing the synthetic culture medium with the addition of agar. In this methodology, monoalgal colonies are formed, making their isolation easier (Pachiappan et al., 2015). However, contamination by fungi and bacteria can hinder the growth of microalgae, in addition to forming colonies. One of the most common ways to get rid of fungal and bacterial contamination is the use of antimicrobials such as the antifungal amphotericin b and antibiotics such as streptomycin (Grether-Beck, 2008). However, antibiotics end up increasing the cost of production and prevent selectivity by competitiveness and resistance in non-axenic media. Also, this technique requires expensive equipment and culture media, such as a BOD incubator, agar, and, in some cases, antimicrobials, in addition to basic training in microbiology.
A selection technique by competitiveness through the culture medium aging was also used, selecting *Chlorella* sp. and *Scenedesmus quadricauda*. These taxa are considered resistant to physical and chemical variations in the environment and highly competitive compared to other species (Cazzaniga et al., 2014). The culture medium aging technique has as its main factor the induction of selection and competitiveness among species of microalgae for a prolonged period (six months in our case). The disadvantage of this technique is the long period required to achieve a satisfactory result and the presence of cross-contamination. Furthermore, the technique works with the selection of groups, requiring other techniques for isolating specific cells.

The serial dilution technique allowed isolating only *Chlorella* sp. The technique results in a logarithmic geometric progression of the concentration, also assisting in cell counting methodologies as long as a dilution control is carried out, enabling the quantification of samples with a high concentration of these microorganisms (Hallegraeff, 1995). However, the technique requires an adequate laboratory environment and basic training in microbiology.

The micromanipulation technique by cell capture using microcapillaries allowed isolating only *Chlorella* sp. Micromanipulation has a higher degree of difficulty because it depends on the manipulator’s manual skills (Singh et al., 2015), who must aspirate only one cell from the culture. Dilution is necessary for very dense media to facilitate the collection of the desired microalgae. The technique can still cause cell damage, thus hindering its multiplication (Pachiappan et al., 2015). Its advantage is the extremely low cost compared to other techniques, but it requires great skill and dexterity in handling the microcapillaries.

In short, the results of this study indicate that pisciculture wastewater can provide autochthonous microalgae with great potential for applications in the most diverse areas of the food, pharmaceutical, nutraceutical, biofuel, and sanitation industries, among others. The study of the taxonomic diversity of microalgae and their growth kinetics in a controlled environment, associated with cell isolation techniques, may point out paths for the bioprospection of microorganisms with great biotechnological potential. In addition, these studies provide subsidies for sustainable aquaculture production, increasing the productive life cycle of fish farming by using wastewater both in the cultivation and bioprospecting of autochthonous microalgae. Therefore, an environmental burden and an economic bonus can be transformed into microalgal biomass production.

**5 FINAL CONSIDERATIONS**

The application of the methodology for collecting pisciculture wastewater and its inoculation in a controlled laboratory environment was essential for a better understanding of the growth kinetics and ecological succession of the main taxonomic groups of autochthonous microalgae. Furthermore, the isolation of microalgae of biotechnological interest depended on these baseline studies.

Five species of biotechnological interest could be isolated among the 15 species of microalgae initially identified in the pisciculture wastewater. Among them, *Chlorella* sp. showed the highest potential...
due to the ease and success of isolation, higher tolerance to environmental variables, availability of literature on its biology, and use and application in biotechnology. Despite the success in the number of species of microalgae isolated by the streaking technique on solid medium, all techniques were promising and isolated at least one species of microalgae of biotechnological interest. Furthermore, the association of both isolation techniques can be considered to reduce time and cost and increase the success of the selection and isolation of a single microalgal cell of interest. Similarly, the sequence of studies involving wastewater collection, laboratory incubation, analysis of growth kinetics and ecological succession, and isolation techniques were essential for the compilation of bioprospecting data of autochthonous microalgae from pisciculture ponds. Thus, further studies are expected to evaluate the different uses and applications of isolated microalgae.

**ACKNOWLEDGMENTS**

We appreciate the support of the Federal University of Grande Dourados (UFGD), the Foundation to Support the Development of Education, Science and Technology of the State of Mato Grosso do Sul (FUNDECT) for providing a scholarship the 1st author and 2nd co-author and the Federal University Southern Bahia (PROPP/UFSB), notice No. 8/2021, process No. 23746.003400/2021-88, for providing financial support.

ABSTRACT
During Antiquities (384 – 322 b. C) to Modern Age (1453 – 1789), deaf people were excluded in familiar, educational and social sense, devoid of legal rights, as marriage, vote and family inheritance, and were considered “lazy” for using sign language instead of trying oral communication. Despite significant progress concerning inclusion and the overall struggle for citizenship rights to deaf Brazilians, many of them are still socially marginalized and feel decriminalized by health professionals. This study refers to an exploratory research, which aims to identify and understand what has been published, between 1990 to 2019, on the approach that Clinical Psychology uses when attending deaf people and also to identify the main methods used by these professionals. For data collection, this investigation used scientific articles, monographs and master and doctoral thesis, from Scholar Google and other periodicals. Before the twelve references used, three categories were cataloged in order to identify the methods adopted by this psychologist professional, such as Libras and the immersion in deaf culture, interpreters, and adaptation of techniques. It is concluded that there is limited material about the theme and that clinical psychology has a hegemonic position regarding the clinical practices to attend deaf population and, for such, there should be a dialogue between political and social aspects concerning the interventions used in the individual clinic.

Keywords: Clinical Psychology. Deaf. Therapy.

1 INTRODUCTION
According to the Aurélio Dictionary, a disabled person is one who has physical deformation or insufficiency of a physical or mental function. Hearing impairment consists of the partial or total loss of the ability to detect sounds, caused by malformation, due to genetic causes, damage to the ear or the composition of the hearing aid. According to the World Health Organization (2015), worldwide, at least 5% of the population, approximately 360 million people live with deafness. In Brazil, based on the census carried out by the Brazilian Institute of Geography and Statistics (IBGE) carried out in 2010, 9.8 million Brazilians have hearing loss, which represents 5.2% of the Brazilian population that has great hearing difficulties. The data highlight a significant population of people with hearing impairment, therefore, a large number that need special attention. For this reason, the study we are now undertaking is articulated around this premise, developing its objectives from there.

For the purpose of precision, from the organic point of view (BISOL; VALENTIN, 2011), a distinction is made between partial hearing loss, when there is hearing residue, and deafness, when hearing loss is total. The reason why this terminology is specified lies in the fact that in each period terms compatible with the values prevailing in each society are used (SASSAKI, 2002). However, for Bisol and
Valentin (2011), the organic perspective is not the only one that exists. There is historical and cultural understanding, which highlights different experiences and differentiation in hearing. Deaf people are people who identify with sign language, with the deaf community and culture, do not consider themselves disabled and are proud to be deaf. Hearing impaired would be those who do not identify with the cultural range and the deaf community itself. Therefore, in the present study, we will use the terminology “deaf” instead of “hearing impaired”.

In antiquity, Greek and Roman empires, for example, saw the deaf as animals and ended up being isolated or killed (BIANCHETTI, 1998). Aristotle (384 – 322 BC) thought it was absurd to teach the deaf to speak, as he believed that people without speech, consequently, are not able to speak and think. For the philosopher, hearing contributes to knowledge, so deaf beings are naturally incapable of reason. During the Middle Ages (476 – 1453), the deaf were excluded in every way: family, affective, educational and social. They were also devoid of legal rights such as marriage, family inheritance, and the vote. Evolving into the Modern Age (1453 – 1789), only the deaf who could speak were provided with legal rights. In 1880, in the Contemporary period, in Milan, the International Congress of the Deaf-Mute was held, where sign language was officially prohibited from being taught in schools for the deaf, claiming that the deaf are “lazy” to speak, preferring to use the sign language (STROBEL, 2008), adopting the oralization method (BAALBAKI; CALDAS, 2011).

Currently, Law No. 10,098, approved on December 19, 2000, also known as the Accessibility Law, allows the imposition of general rules and regulations to provide accessibility to people with disabilities or reduced mobility. This law is articulated with other legal provisions, such as Decree No. 5,626, signed on December 22, 2005, and the Libras Law, No. 10,436 of April 24, 2002, which finally legally recognizes the use of Brazilian Sign Language as a means of communication, promoting greater social inclusion and increasing the exercise of citizenship (BRASIL, 2000).

Even with the regulation of the Libras Law, bringing great advances in terms of inclusion and the struggle for citizenship rights for deaf Brazilians, many still feel discriminated against and, at times, socially excluded due to deafness. The marginalization of deaf people is not just common sense, there is often also discrimination displayed by health professionals. According to Othelo and Dalmaso (2009), as in the past, health service practices are made from the socio-historical-cultural relationship, where professionals segregate people with disabilities.

Bearing in mind that for the particularities of the deaf universe to be properly understood, it is necessary to have awareness and awareness on the part of professionals, such as the psychologist. In other words, it takes a trained professional to encourage the individual to perceive himself as he is, not just considering his daily “limitations” resulting from his “disability”. In this sense, it would be expected that in the field of psychology, professionals would be sensitized to work with the deaf clientele in an inclusive and citizen way.

In view of these notes, it was realized the need to verify and understand, through a bibliographic
review, how clinical psychology has thought about the care of the deaf person. From a rescue in academic-scientific literary production, this study aims to identify and understand what has been published, researched, between the years 1990 to 2019, on the positioning of clinical psychology regarding work with the deaf, as well as identifying the main methods used by these psychologists when faced with this specific public.

Based on this problem, we believe that this research can bring academic knowledge to the population that is affected by the proposed theme, obtaining reliable reports in an area so little explored and with little theoretical reference. We also believe that the proposed theme is of paramount importance for future professionals who are interested in this area and seek to understand why there are numerous obstacles in this path.

2 PSYCHOLOGY AND DEAFNESS

Psychology and deafness have been intertwined for a long time on the international scene (POLLARD, 1993). For Bisol, Simioni and Sperb (2008), the interest in deafness is directly related to the development in the field of education for the deaf.

According to Bisol et al. (2008), as in other areas of health that apply to deafness, the same occurs in psychology: there are authors who defend the oralization of the deaf subject, others oppose this idea and are in favor of bilingualism and Libras. Defenders of oralization usually identify with the clinical-therapeutic model, on the other hand, supporters of bilingualism and Libras are sympathetic to the socio-anthropological concept.

The clinical-therapeutic model was concerned with diagnosis and rehabilitation, which reinforces the educational view as a recovery method, which prioritizes medical diagnosis, concerned with curing the hearing problem, correcting speech and its defects, and training of lip reading. This model was directed towards the normalization of the deaf subject and his adaptation to society and its criteria of normality, being the main objective of educational and therapeutic interventions (SKLIAR, 1997 apud BISOL, 2008). For Skliar (1997, p. 111), medicalizing deafness means:

(...) direct all attention to healing the hearing problem, correcting speech defects, training certain minor skills, such as lip reading and articulation; (...) And it also means opposing and giving priority to the powerful discourse of medicine in the face of the weak message of pedagogy, explaining that it is more important to wait for a medicinal cure – currently embodied in cochlear implants – than to compensate for the hearing deficit through psychological mechanisms. functionally equivalent.

During the 1950s and 1960s, with the emergence of Psychology of Deafness, the clinical-therapeutic model gained strength in psychology. In this period, the deaf subject was stigmatized and had characteristics considered inherent to them, such as motor difficulties, slow learning, emotional, linguistic, social and intellectual problems (SKLIAR, 1997 apud CASALI, 2012). In the course of the 1960s, the clinical-therapeutic model, in the eyes of psychology, began to suffer questions that proved that sign languages are

For supporters of bilingualism, it is assumed that the deaf should be exposed to Libras as soon as possible. Souza (1995) argues that from bilingualism, the linguistic knowledge built from the teaching of Brazilian Sign Language, would help the deaf subject in learning the oral language.

The socio-anthropological model proposes that deafness be seen with other eyes: as a linguistic and cultural difference. Many deaf people regard themselves as a linguistic minority and not as disabled. According to Padden and Humphries (1988, p. 44 apud BISOL, 2008, p. 393):

(...) 'disability' is a label that historically does not belong to Deaf people. It suggests political and objective self-representations that are not familiar to the group. When Deaf people discuss their deafness, they use terms that are deeply related to their language, their past, and their community. Deaf people have a history of allying with other disabled groups, but it is not a primary term of self-identification (…).

This change of archetype introduced in psychology a new look at deafness and the deaf subject, because the socio-anthropological perspective does not qualitatively or structurally differentiate the mind and psyche of the deaf individual, only the difference in communication (GONÇALVES, 2005). apud MACÊDO; TORRES, 2017).

Authors and researchers such as Briganti (1987) and Gaiarsa (1986) (apud CATTALINI; FORNAZARI, 2007), argue about the need for professional psychologists to assimilate the communication of the body in motion, so that its development in their activities is more effective. According to Cattalini and Fornazari (2007), obtaining theoretical knowledge about non-verbal communication, such as expressing, understanding and receiving non-verbal signals, is extremely correlated with the individual's professional performance in society. The authors claim that sign languages are natural languages like oral ones, they appear spontaneously from the interaction between people. Structurally, such language allows the demonstration of any communicative or expressive concept of the human being, providing the structure of thought and cognition, enabling social interaction between individuals. Maluf (1994) indicates that the psychologist must be a scientist of knowledge and have sufficient theoretical and methodological background to understand his object of study, not being a professional limited to the techniques to be applied.

Taking, therefore, our concern with the possibilities of development of the psychological clinic with deaf patients, we undertook, as already mentioned, our bibliographical research, as we will see below.

3 METHODOLOGY

Research means analyzing or investigating answers to a question. The motivations that lead to carrying out a scientific research can be for intellectual reasons, such as the satisfaction of knowing something, or practical reasons, such as knowing something more efficiently. According to Gil (2007, p. 17 apud GERHARDT; SILVEIRA, 2009, p. 12), research is defined as:
(...) a rational and systematic procedure that aims to provide answers to the problems that are proposed. The research is developed through a process consisting of several phases, from the formulation of the problem to the presentation and discussion of the results.

The bibliographic research is developed from the survey of theoretical references already published and analyzed, consisting mainly of books, magazines, scientific articles, monographs, dissertations, theses, among others. According to Fonseca (2002 apud GERHARDT; SILVEIRA, 2009), some scientific research is based solely on bibliographic research, seeking theoretical references in order to collect data or prior information about the initial questioning.

This study refers to an exploratory research, which aims to provide greater familiarity with the problem, in order to make it more explicit or to build hypotheses (GIL, 2007 apud GERHARDT; SILVEIRA, 2009).

For data collection, we used the Google Scholar platform (Scholar Google), and, concomitantly, articles from other platforms such as Scielo (Scientific Electronic Library Online), Electronic Journals of Psychology (PePSIC) were found. The words used in the research tools were: clinical psychology, hearing impaired, deaf, psychologist, interpreter, Libras. The same descriptors were searched in English: clinical psychology, hearing impaired, deaf, psychologist, interpreter.

This investigation was carried out in scientific articles, monographs, master's and doctoral theses. Initially, a ten-year review was carried out, but with many similar results, we decided to expand the search, cataloging theoretical references published between 1990 and 2019. From the investigations, 12 studies were found, which fit the inclusion criteria of the review, that is, that the article should address how clinical psychology thinks about care for the deaf.

4 RESULTS AND DISCUSSION

Based on the bibliographic survey, twelve references were selected for data collection, based on the general and specific objectives, organized by year, title, objective and authors (Table 1).

As guided throughout the research, the clinical-therapeutic model reinforced healing and was directed towards the normalization of the subject, prioritizing medical diagnosis and speech correction. The paradigm shift brought to psychology a different look at deafness and the deaf subject. From the socio-anthropological model, the deaf would not be stigmatized with emotional, linguistic, social and intellectual problems, only linguistically and culturally different. Several authors claim that understanding, expressing and receiving non-verbal signals is directly related to the psychologist's role in society.

In view of the results found and from the objectives of this research, three categories were cataloged in order to identify the main methods used by these psychologists when faced with this specific public: Libras and immersion in the deaf culture; interpreters; and adaptations of techniques.

In the “technical adaptations” category, there are texts by the authors Medeiros (2005), Cattalini and Fornazari (2007), Rosa (2017), Neves (2018) and Tostes (2018). The authors Gilckman and Harvey (1996 apud MEDEIROS, 2005), believed that one of the possibilities of assisting the deaf subject in the context of psychotherapy would be based on their cultural reference, through metaphors and proverbs appropriate to their experiences. For the writers, therapeutic techniques of metaphors and proverbs allow the psychologist to enter into unconscious experiences, feelings and thoughts, enabling new learning and new meanings.

At the same time, the authors emphasize that the psychotherapist must be flexible and adapt his techniques when faced with a different culture, because from the moment the therapist comes into contact with such experiences in common with the patient and manages to express them in a symbolic way, he guarantees to the deaf subject some personal meanings to relate the image and multiplies the number of probable associations he can make (LANKTON; LANKTON, 1983 apud MEDEIROS, 2005), in addition to enabling its understanding via metaphor. Together, the proverbs are relevant for the patient to promote meaning with the connection to the world and, with that, to “reinforce resources” in his attempts at reference.

The logic of analogy can also be used to appeal to consciousness, referring to rooted and automatic associations, mental mechanisms and patterns of behavior. Such an analogy tends to activate internal responses, making them available for better problem solving.
The authors Cattalini and Fornazari (2007) reinforce that the professional psychologist working in the cynic, must have theoretical knowledge about non-verbal communication, such as having the ability to receive and emit non-verbal signals, thus, communication will not only come from language Portuguese or Brazilian Sign Language, but an attitude. Faced with linguistic precariousness, psychologists can carry out some interventions to make listening possible, such as drawings and play (TOSTES, 2018), use of paper, pen and pencil to help subjects who read and write (NEVES, 2018), in addition to to consider body and facial expressions and even the silence of the deaf (ROSA, 2017). For Solé (2005 apud NEVES, 2018), even if clinical listening is not guaranteed from the sound bias, it is effective for associative chains and transference movements. Psychoanalytic psychotherapy provided a place of subjectivation for this subject.

Within the “Libras and immersion in deaf culture” category, the texts by authors Souza (1995), Casali (2012), Rosa (2017), Galvão (2018), Gonzales (2018), Mattioni (2018) and Tostes stand out. (2018). Most recent literature is observed, as the authors Rosa (2017) and Gonzales (2018) point out that knowing the Brazilian Sign Language – Libras, is the first adaptation and prerequisite for working with this language. public, because if the way of communicating between therapist and patient is not clear, listening to the unconscious will be impaired. For Mattioni (2018), the qualification of the psychologist in Libras will be the necessary instrument to expand the possibilities of communication, something vital for the service to happen in a fluid and authentic way (GALVÃO, 2018).

In addition, the psychotherapeutic encounter between hearing subjects and deaf subjects is an intercultural encounter, requiring the psychologist’s immersion in the understanding of the deaf culture, its reality, community, rites and habits (SOUZA, 2015 apud ROSA, 2017). In addition to being aware of the identity, affective and macro-political singularities that emerge in the life of the deaf subject (TOSTES, 2018), also thinking about effective strategies for quality care (CASALI, 2012).

Souza (1995, p. 85), complements the thought saying:

I dare to propose that, as psychologists, if we assume the bilingual conception, we will radically change the nature of our work with the deaf person: from “rehabilitators” we will move on to “psychotherapists”, to "school psychologists" or any other function.

Clinical psychology must be present and active within this community, promoting inclusion, respect, freedom, dignity, equality and integrity of the human being.

Finally, the category “interpreters”, signaled in the texts of Casali (2012), Santos and Assis (2015), Silva and Carmo (2016), Rosa (2017), Mattioni (2018) and Tostes (2018). On the issue, Santos and Assis (2015) state that because clinical psychologists are not qualified to deal with Libras, they end up using interpreters. Casali (2012), complements saying that while there are no psychologists qualified in the use of Sign Language, the assistance to the deaf person with the professional interpreter of Libras is indispensable, because with his presence the communication with the patient will be established, making the process viable therapeutic approach and assuring the deaf subject the linguistic right to be supported in
their own language (MATTIONI, 2018).

Keychain, Barbosa and Porto (2008, apud CASALI, 2012) declare that the presence of the interpreter is highly valued by the deaf, but with some observations such as shame in exposing private matters, distrust and even availability on the part of the interpreters. At the same time, Silva and Carmo (2016) and Talask (2006 apud ROSA, 2017) contest the participation of a third person within the therapeutic setting, claiming that the interpreter can interfere with care and the therapist/patient bond, and may also compromise the contract, established and the professional secrecy they.

At the same time, the act of interpreting can have personal feelings on the part of the professional interpreter, not proving the reliability of what is being transmitted. In addition, Piret (2007 apud TOSTES, 2018), states that in the psychotherapeutic context, the interpreter would occupy a significant position in the transference and countertransference processes, where there are unconscious aspects, not guaranteeing to the psychologist the subjective manifestations of the patient.

5 FINAL CONSIDERATIONS

The present study sought to understand how clinical psychology has been thinking about the care of the deaf person. Based on this premise, the research carried out provided a greater understanding of how the deaf population is misunderstood since antiquity, when they were deprived of legal rights, considered incapable and sometimes dead, to the present, where, even with laws in their favor, are neglected by society and by health professionals, who are excluding with this population. The development of the article allowed us to capture which methods psychology has been thinking to meet this linguistic, cultural and social demand that encompasses this audience.

From the results found and the discussion carried out, the main methods and adaptations used in the attention to the deaf population were observed, such as the knowledge of Libras and how the immersion within the deaf community is essentially important to enter this world, the use of interpreters of the Brazilian Sign Language within the therapeutic setting and its criticisms and the adaptations of techniques and managements towards the deaf individual, such as the use of materials, playful methods and the observation of body and facial expressions, which is antecedent to every professional psychologist.

When starting to contextualize the theme, we realized how limited the number of articles, monographs and master's and doctoral theses is in relation to the problem. It is worth mentioning that a space of twenty-nine years was subjugated for the accomplishment of the bibliographic review and few references were selected for the description of the results and discussions. Just as the contradiction is observed, even for psychology, which is said to be inclusive, being preponderant for producing and having little knowledge, within the clinical and individual practice, aimed at the inclusion of minorities, such as the deaf population.

Given the relevance of the proposal, it is hoped that more research and materials will be produced and carried out and that future professionals will be interested and affected by the topic discussed.
in the face of the inclusion of the deaf subject, reflecting the plausible low academic production and scarce discussions on the subject, comes from the curricular formation of the student in college. Which, in most cases, the offer of the Libras subject is mandatory, however its realization is optional. There is a need for greater criticality within clinical psychology towards the deaf population and a colloquium between political and social aspects regarding interventions made within the individual and clinical setting.

CHAPTER 142

The EJA modality and ludicity: the story behind the student-character as a social being

1 INTRODUCTION

This article has as its main focus, to present a proposition and analysis about an activity proposed by two students, at the undergraduate level of the Integrated Degree in Science, Mathematics and Languages Education at the Federal University of Pará, in a class enrolled at the teaching modality Youth and Adult Education - EJA of a state public school, located in a peripheral area of the city of Belém - PA. It is worth noting that the material and production presented here comes from a training process acquired during the theme Teaching Internship I, until then taught by Professor Dr.ª Elizabeth Souza, and the Center for Teaching Practices and Languages, via EncantArtes, a project coordinated by Professor Dr. Isabel Rodrigues, both professors at the Institute of Mathematics and Scientific Education at the Federal University of Pará.

This work also presents some of the analyzes made by students who were part of this formative process with Youth and Adult Education, in this way, the practice carried out by students is presented, as well as the challenges and important points for students’ understanding of this modality that a tanto longs for a deeper and more delicate look at its questions. It is also intended to demonstrate that significant learning can be carried out in a playful and non-childish way, as often occurs in EJA classes.

2 THE ENCANTARTES PROJECT AND THE TOPICS OF SUPERVISED INTERNSHIP OF THE INTEGRATED LICENSE DEGREE: LINKS FOR TRAINING

By developing activities aimed at the mediation of reading, EncantArtes is a project that brings together the ludic and the literary, and defends the idea that there is a real approximation with the classroom, producing significant knowledge. According to Rodrigues (2017):

“We really have to create work strategies allied to reading strategies and mediation strategies. It is something that is still under construction, but it has already affected students because of the engagement they have had with our work.”

In line with this work, a proposal for intervention in schools was presented together with students of the degree itself, with the support of teachers working in the topics of Teaching Internship, among these teachers, Professor Elizabeth Souza. According to the Political Pedagogical Project of the Integrated Licentiate Degree course - PPC/IEMCI 2008, the stages add up to a total of three, each of which has a different approach, understood as essential:

A) The Teaching Internship I is characterized by the development of research and observation in the first, second and third years of elementary school.

B) The Teaching Stage II is characterized by the development of research and observation in the fourth and fifth years of elementary school.

C) The Teaching Stage III is characterized by the development of research and observation in the EJA teaching modality, which may or may not be linked to the student with some special need who is in this modality.

After a period of mini-courses, approximately seven meetings in the Institute's playfulness laboratory and preparations for storytelling, expressions, oral and body languages and other qualifications necessary to obtain success in terms of storytelling and reading mediation, the students were directed to the schools for the project to be carried out. Along with this training process, the students who attended the subjects of stage I, II and III, due to the integration for storytelling, also had the opportunity to develop this project in their regency periods, and thus be mediators of reading in their experimental classes, being led to reflect on their own training and what artifices they would use in these accounts for different levels of education and even a modality.

3 CHILDHOOD EDUCATION AND EJA: SAME DIRECTION, OPPOSITE PATHS

When we think of education as a producer of scientific knowledge, it is also important to understand that all beings endowed with humanity are endowed with different formations, bases and levels
of development. The zones understood as real, proximal and potential are pointed out by Vygotsky, and play a fundamental role. According to this author, we have:

The first level can be called the actual developmental level, that is, the level of development of the child's mental functions that have been established as a result of certain cycles of development already completed. When we determine a child's mental age using tests, we are almost always dealing with the actual developmental level. In studies of children's mental development, it is generally accepted that only what they can do for themselves is indicative of children's mental capacity. (VYGOTSKY, 1998 p. 111).

The teacher's role, according to this thought, is that of a knowledge mediator and must exercise a link between real and potential knowledge, seeking to develop this student during his school career. On the other hand, it is important to realize that the real knowledge of a child, even as rich as it may be, cannot be compared to the real knowledge of an adult, who has already gone through different subjective and social formations. Based on this assumption, why is there an insistence on infantilizing this student? If the challenges of EJA are different, why is there still an insistence on thinking of this modality as what should be repeated what has already been done in early childhood education? According to Di Pierro (2005), also cited by Amparo (2012):

[...] the compensatory paradigm ended up cloistering the school for young people and adults in the rigid curricular, methodological, time and space references of the school for children and adolescents, interfering with obstacles to the flexibility of the school organization necessary to meet the specificities of this sociocultural group. By looking at the lack of experience and school knowledge of young people and adults, the compensatory concept nurtures prejudiced views that underestimate students, makes it difficult for teachers to value popular culture and recognize the knowledge acquired by students in social life and at work. (DI PIERRO, 2005, p. 1118 apud AMPARO, 2012, p.53).

In addition to other factors, the educational guiding documents themselves, which should, in theory, equal Brazil in order to equate education, such as the most current guiding document, the National Common Curricular Base - BNCC, even in its third version, does not bring a direct reference to what these EJA curricula should actually guide, going against the National Education Plan, approved in 2014, which provides in its article 2, which deals with its guidelines:

I - Eradication of illiteracy;
II - Universalization of school attendance;
III - Overcoming educational inequalities, with an emphasis on promoting citizenship and eradicating all forms of discrimination;
IV - Improvement of the quality of education.

It is impossible to think of “universalizing”, “overcoming inequalities”, “eradicating illiteracy” and/or “improving” education, if there are no subsidies for a teaching modality such as EJA to be able to leave the condition of forming people who had their stolen opportunities, to also be a trainer of critical and
reflective beings of their own condition. In this sense, it is increasingly necessary to think about practices that promote student learning in EJA.

4 THE TEACHING AND LEARNING PROCESS IN EJA THROUGH STORY TELLING: LIMITS AND POSSIBILITIES

When developing the plan for the experimental classes, activities of an interdisciplinary nature were thought from a central theme, following the idea of didactic sequence, and it was named by the authors as: “the diversity of my people: O Pará”, which would serve as a basis for classes in languages, mathematics, history, geography, arts and musicality and ending with what we will focus on at this moment, with the storytelling experience within the scope of the aforementioned project and the internship themes.

After two days developing these practices for the propositions of the subjects mentioned above, on the third day, the EncantArtes group was at the school, for what would be an afternoon of activities with different storytelling for students of the early years, including our history, that following the theme proposed by the didactic sequence, a legend was selected, that of the açaí, or the legend of Iansã, which would later give the name to the fruit.

The adequacy of language for age, body movements and voice differentiation, in addition to the interpretation itself, made these students increasingly interested in the class, and to the surprise of these researchers, each of these students took for themselves a role of the story by their own free will, making storytelling a more attractive form of interaction between student-student and student-teacher, who could be side by side, experiencing the story told there, while in their eyes, there was a glow and interest such as had never been expressed before.

Following this same line, we arrived at the focus of this work, the EJA, in which it was proposed to present, carry out the story, in an EJA class of a public school on the outskirts of Belém. The first challenges arose, and mainly, not knowing what a group of this level would be like, considering their differences in age, development and general training, however, based on the experience we had in the first training at the Institute with the contact group, we decided to adapt the same story used with early childhood education, but this time, modifying the type of language to be used, forms of expression and interaction with the public, seeking to make the story interesting to the new audience and to generate interaction.

The first point to undergo a transformation was the language to be used, we knew that a difference between the way the story is told combined with the movements of the body, can influence the telling. In this way, we understand that “Vocal intonations register an infinity of emotions, which are constantly fed by the reactions of the listeners” (BRENMAN, 2012, p. 105), the author also highlights that “the voice, in turn, does not work alone. , it reverberates throughout the accountant's body: eyes, gestures, facial expression. The oral narrator is an artist of voice and gesture.” (BRENMAN, 2012, p. 105).
During this process, we noticed an approximate number of 20 (twenty) students in the classroom, with an approximate age group between 20 and 60 years, in which all of them worked during the day, which justified their stay at that time and in that type of teaching. In a first contact, the tiredness expressed on their faces was visible, their interest in those people in their room, ready to carry out stories that would bring learning to them and mainly, the astonishment at the age of the future teachers who were there, who now he was getting so close to his present age and now he was getting farther away. Then, we had a different class than the initial one, which for the authors of this work were surprising and revealing as to which paths to follow.

It was possible to perceive the interaction of the students, their interest in storytelling, and before a room characterized as silent, full of people tired of their daily lives, it becomes a class full of smiles, interactions, contacts and especially significant learning, thus allowing that there was a better use of those students, their experiences and giving voice to this being, considering that these EJA students did not assume roles in the story of accountants, however, of student-characters, who identified in these oral moments, their own life stories there, reflected in previous moments, such as his childhood, the countryside and the life of an açaí collector, as expressed in the classroom by the people themselves, statements such as:

A1: *In the countryside we hear this story a lot, but not like that, in this way*

A2: *I knew this story, but this is way better to tell!*

Reaffirming even more the importance that should be given to culture, storytelling and the involvement of real and potential knowledge in this teaching and learning process, as stated by Vygotsky. Thus, we emphasize the importance of this practice not only for these students, but also for the teachers in training who have experienced and still experience these practices in the most different school environments.
5 CONCLUSIVE DISCUSSIONS

It is known that the history of EJA tends to put this social being, with thoughts, experiences and real knowledge (VYGOTSKY, 1998), in an infantilized position and who is understood as the marginalized by society, who seeks to be in the classroom. class just to make up time that had been taken away from him. However, in addition to that, these students can, and need, a more specific look at their peculiarities and specificities, not only in the classroom, but also outside of it. According to Arroyo (2005), also cited by Sousa et al (2017):

[...] when referring to young people and adults, it names them not as apprentices of a teaching stage, but as learners, that is, as cultural and social subjects, young people and adults. This difference suggests that EJA is a modality that has built its own specificity as education, with a look at the students (ARROYO, 2005, p. 224 apud SOUSA et al, 2017, p.3989).

In this way, the school curriculum should not, and cannot, be thought of in an egalitarian way, with regard to the curriculum of early childhood education for this teaching modality. In this way, it is also necessary that the practices are differentiated and that they actually meet this student and their learning needs, respecting their culture, social life, organic issues, among other situations to be taken into account. Also according to these authors:

Overcoming the formalist conception of curriculum and incorporating more dynamic elements of the daily life of schools and classes in which curricula gain their real existence is a great challenge. Overcoming it depends on the knowledge of the richness of everyday practices, on the impossibility of working in the same way in classes, schools, different spaces, which change the entire spatial environment, in addition to the students we come across. (ARROYO, 2003, p.221 apud SOUSA et al 2017, p.3989).

In this way, practices like the one presented here are increasingly necessary, since, in the eyes of these authors, the class becomes much more interesting when there is an interest, primarily on the part of the teacher, and the students present there, to participate in that moment of learning and sharing their experiences as powerful tools for knowledge construction. These, on the other hand, can only demonstrate the wealth of their knowledge when there is a planning “permission” for such interaction to occur. According to Libâneo (1994), also cited by Muller (2002):

The pedagogical act can then be defined as a systematic activity of interaction between social beings both at the intrapersonal level and at the level of influence of the environment, an interaction that is configured in an action exercised on subjects or groups of subjects aiming to provoke in them such changes. that make them active elements of this very action. It is assumed there, the interconnection of three elements: an agent (someone, a group, etc.), a transmitted message (contents, methods, skills) and a learner (student, group of students, a generation) (... )” (LIBÂNEO, 1994 p.56 apud MULLER, 2002 p.277)

It is important to emphasize that the teacher should not play the role of artist, this profession is given to another professional, however, it is necessary to make use of different instruments to reach the desired end, in this case, learning in a significant number of EJA students, on the other hand, not restricted
to it. In the case reported above, the pleasure expressed by teachers in training is clear, which is transmitted to students and vice versa, which, in our opinion, is what should predominate in the classroom, the pleasure of mediating knowledge and learn together, building in this way a new school configuration, without curricular prisons.

ABSTRACT
The writing of this research is based on some concerns, such as the lack of incentives regarding the use of cordel literature in pedagogical actions, although, in recent years, this reality has changed (COSTA, 2017).

Therefore, we defend the possibility that it is possible to articulate the poetic discourse of cordel to the historiographical discourse through specific methodological strategies, in order to strengthen the relations between literary and historical texts in school spaces. These reflections can be worked on, for example, in elementary education, especially in its final stage, based on the dialogue between teaching and research, as well as the use of historical and literary sources, such as cordel literature.

1 INTRODUCTION

The writing of this research is based on some concerns, such as the lack of incentives regarding the use of cordel literature in pedagogical actions, although, in recent years, this reality has changed (COSTA, 2017).

Therefore, we defend the possibility that it is possible to articulate the poetic discourse of cordel to the historiographical discourse through specific methodological strategies, in order to strengthen the relations between literary and historical texts in school spaces. These reflections can be worked on, for example, in elementary education, especially in its final stage, based on the dialogue between teaching and research, as well as the use of historical and literary sources, such as cordel literature.

The research proposal, interested in valuing the teaching of history and the use of cordel literature as a methodological resource, is important to emphasize that teaching knowledge and practices are part of a teaching-learning process. For this reason, as Nascimento (2005) argues, the valorization of various languages in the classroom is an integral part of this discourse, including literary language in the classroom and not just sticking to the textbook or purely expository class.

Thus, this research gives rise to leaving the tabs of textbooks and content assessments to dialogue with methodological practices that allow students to know and learn procedures of historical research, in addition to producing and systematizing historiographical knowledge in cordel. From this perspective, the
research seeks to answer the following question: Is it possible to problematize cordel as an interdisciplinary strategy?

In this way, the dialogue around the teaching of History with literary texts is discussed here, especially the cordel from the discussion with the History teachers of the Municipal School Professor Nair Fernandes Rodrigues in the municipality of Assú / RN.

So, how do EMPNFR professors problematize the historiographical discourse based on Cordel Literature, and how do they discuss cordel and what are the interdisciplinary challenges?

2 METHODOLOGY

In order to discuss the research proposal and to visualize how the methodological process of the research was carried out, we illustrate in figure 1 the following phases: bibliographic review on the interdisciplinary challenges and possibilities of cordel literature in the teaching of History, then it was thought who would be the research participants and we opted for History teachers, and the approach to collect data was through a questionnaire on Google Forms - due to the practicality and proximity to the teachers and, finally, we performed the analysis of the answers in dialogue with the authors who we are discussing (see figure 1).

The first phase of the research will focus on the bibliographic investigation of authors who study elements related to our objectives, such as the relations between History and Literature with a focus on teaching, in interdisciplinarity in cordel literature.

The second phase is the field research phase (analysis of the questionnaires answered by history teachers answered in the google forms form). At this stage, an approach was considered that would respond to the research concerns and that would dialogue with the bibliographic study, for this purpose the questionnaire applied in Google Forms with the History teachers of EMPNFR (see table 1).
Finally, we discuss through a qualitative approach from the proximity relationship between the researcher and the research object about the meaning of the practices and actions of the participants. Thus, research analysis is one of the paths of investigation and the meaning of research (BOGDAN; BIKLEN, 1994).

3 RESULTS AND DISCUSSIONS

We speak from the interdisciplinary and scientific proposal, a conception that tends to favor teaching and learning practices in basic education and in other levels of education. The use of cordel literature, in this context, is strategic, because, according to Nascimento (2005, p. 3): “The pamphlets are important documents for the teacher to use in History classes; should be explored both in Elementary School [...] to discuss aspects of Brazilian society such as a film, a photograph, a newspaper article, etc.”

Nascimento (2005) refers to a contemporary historiography, in which historical sources also involve other languages (such as literary) in the classroom. The teaching of history, therefore, can and should encompass a documentary and discursive diversity, including from iconography, audiovisual, orality and – why not? – the twine leaflets.

The discussion about teaching, however, does not only involve dealing with methodologies, didactics and curricular contents, but also teacher training, since, in the words of Cunha and Cardôzo (2011, p. 146), the formation of the history educator it is “permanent” and “is done throughout life”. In addition to the methodological and formative dimensions involved in the teaching of history, this research also focuses on the interdisciplinary relations between History and Literature.

In the present discussion, the interdisciplinary is understood as a common aspect of sharing, dialogue and knowledge built in/with the school. Thus, the interdisciplinary to be analyzed is linked to several elements, such as disciplinary boundaries in education, curriculum issues, pedagogical and didactic work (FAZENDA, 2008).

Source: prepared by the researcher (2022).
Thus, we also think of interdisciplinarity as a process, which is discussed by Fazenda (2010), through interdisciplinary knowledge, which is not only the bias that must be developed by teachers, but the process is the most significant point, that is, the educational intervention is as important as interdisciplinary interaction, as Fazenda evidences that (2010, p. 99):

In this case, we deal with what could be called a synthesizing and dynamic enveloping interaction, reaffirming the need for a dialectical, non-linear and non-hierarchical structure, where the professional act of different knowledge constructed by teachers is not limited to disciplinary knowledge. Here we begin to address a new subject, recently researched, called educational intervention, where the process is more important than the product.

If we are talking about the interdisciplinary process, it is pertinent to present how EMPNFR teachers bring interdisciplinarity in History classes, teachers were asked questions related to methodologies, without necessarily referring to interdisciplinarity, but when asking how the teaching work is, it is also questioning the interdisciplinary involvement in teaching activities.

In the first question, we propose to teachers some methodological options, such as: diaries, music, theater, literature, comics, models, literature and cordel literature as resources that they could use or already use in their classes, as mentioned by Fonseca (2010, p.10) it is necessary to incorporate and diversify different sources, languages and resources in the teaching and learning process, and goes on to say that:

The teacher, when teaching History, incorporates the notions transmitted in the child's socialization process, in the world lived outside school, in the family, at work, in leisure spaces, in the various social and educational environments, etc. The formation of the student/citizen takes place throughout life, in different spaces, including the school. Therefore, we must consider as sources of History teaching all vehicles, materials, voices, evidence that contribute to the production and diffusion of knowledge, responsible for the formation of critical thinking: the mass media (radio, TV, press in general), the internet and virtual spaces, literature, cinema, oral sources, monuments, museums, archives, objects, poetry and songs, in addition to printed and textual documents and iconographic sources. Didactic and paradidactic books as sources, work supports, also provide the access of students and teachers to the understanding of this universe of languages. Incorporating different languages into the history teaching process, we recognize not only the close connection between school knowledge and social life, but also the need to (re)construct our concept of teaching and learning.

Following this line of thought, one of the first questions proposed to the teachers was about the methodologies used in History classes, 60% marked the film as the main methodology, and the only methodology not mentioned by the participants was theater, but the use of Classroom film is featured in virtually every response. According to Silva (2012), the popularization and access to the media has expanded both the approach and the concepts of the space itself, which is historical and social (see figure 2).
In the second question, the participants were presented with the process of using or not using cordel in History classes, as well as the evaluation in relation to dealing with cordel. Another highlight is the evaluation process, which according to Silva (2012) is a process (see figure 3).

In the third question, it refers to the following question, which methodology does the history teacher use most in class? And, for this question, it was answered that most use: textbooks, videos, dialogues, comics and, why not with Cordel literature.

<table>

</tr>
</tbody>
</table>
In the fourth question, ask yourself about the use of Cordel Literature in History classes. In this question, they answered that most of them have difficulty using cordel and, they talk about resistance regarding the non-inclusion of Cordel Literature in other disciplines, such as the Portuguese discipline, which is already praxis. But, according to the answers of the professors in the questionnaire, one of the main challenges faced is the lack of interest on the part of the students, as well as the lack of interest in interdisciplinary work.

Source: prepared by the researcher (2022).

In the fifth question, we discussed the challenges of cordel in EMFOM from the responses of teachers, what draws attention is that most teachers still do not use cordel and, when they do, it is superficial. In fact, “the classroom is a space of possibilities that allows the creation and recreation of teaching materials, working methods and pedagogical concepts” (RICARDO, TAMANINI, p. 42, 2022).

Continuing to dialogue with the thinking of teachers about the challenges they face, so they weave that the main problems are the infrastructure, lack of teaching materials, lack of training, incentive, among others.

Table 4: What are the challenges of using Cordel literature in history classes?

<td>teacher 1</td>
<td>I don’t, but now you’re awake.</td>
</tr>
<tr>
<td>teacher 2</td>
<td>reading and interpretation</td>
</tr>
<tr>
<td>teacher 3</td>
<td>Finding material, especially with topics that were most aligned with students’ interests. But I think the biggest problem, in fact, is the difficulty students have in reading, automatically interpreting and liking it. Another great challenge is to arouse this interest, when technology is a great attraction, which instead of being our great ally, becoming a difficulty, because unfortunately we do not have access to it, including a good part of the students (internet).</td>
</tr>
<tr>
<td>teacher 4</td>
<td>The main challenge was to relate cordel literature in history classes and involve students in activities involving cordel. In general, literature and history are interdisciplinary knowledge</td>
</tr>
<tr>
<td>teacher 5</td>
<td>I've never used it in history classes, but I've taught the discipline of Art and worked on cordel literature (or cordel) and it was very good to work on this theme. The students reacted positively to this very important topic.</td>
</tr>
</tbody>
</table>

Source: prepared by the researcher (2022).

Finally, challenges are something that permeates the teaching work and increasingly demand from education professionals continuous training, and this discourse as Gaspar and Levandovski (2021, p. 3) mention as: “[…] pedagogical didactic innovations that can contribute to the school fulfilling its teaching and learning objectives by providing a space full of possibilities”.

As it is presented from the teachers' discourse, how difficult it is to problematize cordel in the discipline of History, mentioned that: “the main challenge was to relate cordel literature in history classes and involve students in activities that involved cordel” (see table 4).

4 FINAL REMARKS

In this text, we discuss the interdisciplinary methodologies as well as the difficulties of problematizing cordel literature in the teaching of history, and thus we propose ways and possibilities for the use of the literary text. Thus, we present a discourse with didactic-pedagogical possibilities from the experiences described during the research.

Cordel Literature from the teachers' discourse is a methodology little used in History classes, of the five teachers questioned, less than half dynamize this method in the classroom, interdisciplinary challenges?

ABSTRACT
The use of electric energy represents an indication of modernity and efficiency of production processes and end-use energy services. However, the large volume of financial resources that are required for the implementation, operation and maintenance of electrical energy systems, as well as the high environmental and social impact that results from their production, transport and distribution, requires that this energy resource be used efficiently, efficacy and effectiveness.

1 INTRODUCTION
The use of electric energy represents an indication of modernity and efficiency of production processes and end-use energy services. However, the large volume of financial resources that are required for the implementation, operation and maintenance of electrical energy systems, as well as the high environmental and social impact that results from their production, transport and distribution, requires that this energy resource be used efficiently, efficacy and effectiveness.

The strong evolution observed in communications, linked to innovation and the dissemination of information technologies raised new opportunities for exploring electrical energy systems. Dialogues and interactions between customers and concessionaires of public electricity distribution services that practically did not exist, are now made possible by communication networks and information technologies. This different look at the market, where effectively the customer's interest must be taken into account not only when paying the energy bill, but mainly in the constraints and opportunities that arise in the adequate and efficient final use and in the decentralized production of electric energy based on in renewable resources, is what is envisaged for the near future.

Particularly in urban areas, electricity is responsible for the quality of life and sustainability of the community. From the question of survival, through security and following sustainable development in its true sense, including the social, economic and environmental issues.

On the other hand, in rural areas, energy is responsible for the socioeconomic sustainability of people, as well as the businesses involved, strongly impacted by climatological conditions. Energy shortages usually result in damage that is almost always irrecoverable. However, the rural property has potential, often quite significant, for the exploitation of distributed renewable resources, such as green biomass, wind, hydraulic and solar.
The real situation today of these properties, whether they are dedicated to agribusiness or even those aimed at family farming, is a marked dependence on rural electrical distribution systems. It is known that the costs of serving these types of customers are not attractive to the concessionaire of public electricity distribution services. The geographic dispersion of customers associated with the low demands of electrical loads and the tariff subsidies granted as incentives, makes the service of rural customers by the distributor to be seen as a burden of the concession.

Seeking to promote at least the energy autonomy of electricity users and serving as a presupposition capable of encouraging the spread of distributed electricity generation, the Federal Government enacted Federal Law 14,300 of January 6, 2022, and legislatively establishing the conditions for the access of micro and mini distributed generation to electric energy distribution systems, through a model of compensation of electric energy inputs. It constituted an evolution of the merely regulatory character of ANEEL, which debuted with Resolution 482 of 2012 and other subsequent resolutions.

CHOWDHURY & CROSSLEY position the so-called “smart grid” more broadly, at the intersection between the electro-energy system, information technologies and the telecommunications network. In fact, it transcends the electrical energy sector, inserting itself and complementing the other information and communication systems used by customers. Particularly, in rural areas, the use of natural resources is not exclusive to the energy sector, being able to respond to other demands for the input, with the irrigation of agricultural crops and the drying and storage of grains. Thus, the complementarity and multiplicity of uses that nature offers us are demonstrated, and it is up to us, with intelligence and parsimony, to maximize the benefits arising both from its storage and from the coordination of multiple final uses, whether energy demanding or not. Figure 1 outlines the main elements that make up an Intelligent Grid in the classic energy segment. Depending on the type of technology that converts the primary source into electrical energy, it can be efficiently generated in direct or alternating current. The electronic inverter ensures the generation procedure adheres to the end-use technologies involved, as well as the possibility of local electrical storage (Batteries). As it is not possible to accumulate in the concessionaire's Electric Grid, the solution for the energy surplus produced is the drainage of energy for converter devices such as cold production, sanitary hot water or even, in the future, hydrogen production. Another alternative also made possible is the application of the energy surplus in the hydraulic accumulation in tanks, weirs or dams.
Using the electrical grid (PLC), optical fiber, or wireless communication systems (satellite, microwave, etc.), smart grids in their broad sense allow the control of the generation, transmission, distribution and uses final energy in real time, with the exchange of data and information, aiming to optimize the reliability of the system, the management of the equipment involved, the safety and the quality of service to the energy market.

Energy Management Actions, whether on the Demand side, directing the way customers use and consume energy, or on the Supply side, with the dissemination of distributed generation and energy storage, implementation actions have been facilitated and automated operation, using the concessionaires' communication and computer systems.

In the agribusiness segment, these technologies complement activities that promote production productivity, called Precision Agriculture. Optimizing the use of energy produced in a decentralized manner adds value to both the agricultural and livestock sectors.

In this case, large properties can ensure a high degree of energy independence, guaranteeing at least energy availability for their essential activities, being able to reach high levels of production that would be stored in self-reserve systems, such as weirs and dams or even in the Electric System. National - SIN. In principle, today it is allowed to produce energy on a micro and mini scale from a renewable source, which can be used for consumption at the site itself or at another belonging to the same generator (equal to CPF or CNPJ). This, for the rural case, enables the generation of electricity in properties aimed at agribusiness with delivery to storage points or grain processing installed on the periphery of urban areas.

For family farming, consortium or cooperative exploitation can also achieve significant amounts of electricity production, also ensuring their essential needs and marketing surplus generation in associations. In this case, the legislation must evolve in order to enable the supply of electricity by the cooperatives in a
decentralized manner and being delivered by the SIN to the agro-industrial units that store and process the grains installed near the cities.

2 THE SUPPLY SIDE APPROACH TO ENERGY

In the context of energy production, the smart grid is able to "learn" the particular behavior of each primary generation resource aiming at its economic optimization. Thus, the network will have, among other actions, to maintain the frequency, voltage and reactive compensation requirements in an automated way. It starts from the principle of composition of electro-energy subsystems that ensure compatibility between the availability of generation, transport capacity and the demand of the consumer market. This form of conception constitutes one of the most efficient and economical solutions to face the disturbances that can lead to the safe islanding of the subsystems. In the transport of energy in large blocks, smart grids make it possible to match the charging characteristics with the power flows necessary to meet the market, as well as in transformation facilities.

These are included in the monitoring and control systems for critical and non-critical operational data such as loading, oil contamination, reactive requirements, performance of protection and interruption systems, as well as essential ancillary services.

The contribution of intelligence in energy distribution facilitates the ability of the network to reconfigure itself, seeking an optimized operation, through automated monitoring and tools capable of detecting or even predicting problems with the database in real time that result from demand forecasts, weather, outage histories, etc.

It is worth noting that the contribution of intelligence to the operation and maintenance of the electrical energy system does not come from today and constitutes a maturation of technological innovations easily incorporated by the engineering of power systems and energy distribution. However, it is in the relationship with the market that smart grids are most effective. A two-way relationship is established between the concessionaire and the customer in a transparent manner.

Considering the case of the rural segment, the focus on the Energy Supply side transcends the electrical issue, prioritizing a more energetic approach itself. Resources that are normally directed to its production may be needed for other more direct uses such as irrigation in the case of hydraulic availability or thermal requirements for drying and preserving agricultural products or heating breeding sites using green biomass inputs.

Once again, the importance of supporting smart grids is highlighted, where information on energy market conditions allows the establishment of priorities for dispatches or the redirection of energy resources to other more rewarding uses. The dynamics of the system ensures both the productivity and the competitiveness of farmers both nationally and internationally. A clear example of this form of decentralized production, today are the Independent Energy Producers – PIE, based on agribusiness and which have cogeneration units for electric and thermal energy. The dispatches of these units in electrical
terms both ensure their own energy supply in the production processes and are capable of supplying active and reactive energy to the SIN. However, they have to share their primary availabilities with internal mechanical, hydraulic and thermal requirements. Smart grids tracking market needs and their associated prices are able to subsidize the decision between prioritizing the SIN or the cogeneration company's own needs. The economic question, both in the short and in the medium term, is the guiding element of the decision. An equivalent example on a large scale is found today in the sugar and ethanol market where trends in sugar or ethanol production are dictated by the international commodity market.

2.1 ENERGY SUPPLY MANAGEMENT

The supply of energy resources, particularly that considered renewable, where the availability cycle is short-term, is characterized by its randomness. A typical example is wind energy, where the winds occur according to the cycles of the seasons of the year, but are dependent on variables such as solar incidence, ocean temperature, land cultivation, geographic characteristics and other constraints. Hydraulicity also depends on these factors, being subject to the same conditions, but as they run through better defined courses (rivers and lakes) in addition to allowing storage, they enjoy better predictability than wind energy. Solar energy presents itself with good predictability, being only affected randomly by the occurrence of clouds and has its intensity dictated by the movement of the Earth, which results in the seasons of the year. Green biomass is the one that presents the smallest variation in the expected production, fundamentally dependent on the work of rural people and climatological benefits.

This context of energy production constraints is reflected for the investor in the exploitation of renewable energy resources in the Capacity Factor of the transformation units. This Factor is defined through the relationship between the average energy production in a given period, normally, one year and the maximum real energy production availability of the installation. Hydraulic energy in the regions of greater economic development in Brazil has periods of favorable rainfall that are considered to be around 5 months of the year. The other months are characterized by periods of low rainfall. Thus, the hydraulic generation units that do not have accumulation reservoirs in these regions reach Capacity Factor values in the order of 40%. Green biomass, as it allows for storage, can reach much higher factors, with only the availability of agricultural crops being conditioned. Its limitation may arise, as evidenced above, from the use for energy and non-electrical purposes itself.

The competitiveness and productivity of the exploitation of energy resources are strongly linked to the complementarity of productive capacities involving the use of multiple energy sources. This is evident if we focus on the rural property as an agent of energy production. In this case, the exploitation of water resources competes with the irrigation requirements for agriculture and pasture. It is necessary to evaluate energy transformation solutions that contemplate both supplies and/or supplementation by other sources such as wind generation and the energy use of biomass.
It is in the establishment of these energy supply management procedures that smart grids provide optimized solutions. Starting with the management of risk situations, the network operates based on protection information from the different technologies used for the production and transport of electrical energy. The signaling and segregation of faults in the generation systems make it possible to ensure the continuity and quality of energy services, practically without human intervention. Based on information on availability of energy resources, such as reservoir levels, wind speeds, volumes of biomass stored, intensity of solar radiation, capacity stored in battery banks, among others, as well as the characteristics of local load and external demands of the SIN, the management network can optimally dispatch the amounts of energy from the different producing sources located on the property.

3 FOCUSING ON THE DEMAND SIDE OF ENERGY

The inclusion of the customer as an active agent of the electro-energy system is very little practiced in the Brazilian SIN, it stems from American and European experiences that date back to the 70's, when the First Oil Shock.

The DSM - Demand-Side Management had its origins in the United States as an instrument of Least Cost Planning (Least Cost Planning). The energy rationalization policy was institutionalized there, in 1977 with the creation of the US Department of Energy. However, numerous private bodies such as energy utilities, banks and professional associations have intervened in the establishment of American energy management policy. Thus, programs are increasingly implemented at the level of electricity and gas companies in close coordination with the state administration through regulatory agencies (Utilities' Commissions). This decentralization constitutes the great difference in the conduction of energy policy in the United States compared to those carried out in other industrialized countries.

In recent years, other governments and electricity companies have renewed their energy management efforts, looking for ways to more rationally use the so-called flow energies (electricity and natural gas) that are difficult to store. The notion of load management evolved to assume a more general concept of demand regulation, involving environmental and social issues.

GELLINGS encompasses, in energy management from the market side, the actions:

- consumption management (Load Management);
- storage (Hydro, Thermal and Electrical Storage);
- energy conservation (Strategic Conservation);
- rational use of electrothermia (Electrification);
- cogeneration (Customer Generation);
- of distributed generation (Distributed Generation);
- of marketing alternatives (Alternative Marketing Strategies) and;
- of new technologies and/or economic uses (New End-Uses).
Fundamentally, there is a demand for energy services and not energy itself. This constitutes an input that enables and/or favors the fulfillment of requirements. Therefore, through a global approach (technical, economic, political, environmental and social) the combination of energy vectors and available technologies that facilitate the fulfillment of needs must be sought, selecting not only that energy requirement that is the most profitable for users, for the community and for the producer, but, particularly, one that simultaneously results in the least impact on the ecosystem. Considering the case of the rural segment, the approach from the Energy Demand side makes it possible to pursue the principles of energy efficiency, linking end-use energy services to the use of natural resources in a more direct way. This is the case of pumping systems using wind or photovoltaic energy, environmental conditioning with the use of biomass or electric energy production through wind or solar systems.

Figure 2 summarizes the main indicators adopted to evaluate the so-called flow energies, which are difficult to be economically stored, accounted for in terms of Energy and Power supply or production. Due to the economic unfeasibility of large-scale storage of flow energy, it is necessary to adopt technologies, both for end use and for electric energy generation, that make the Load and Capacity Factors compatible. The diversity of the coincidence of the powers demanded by the loads must be compatible with the Usage Factors of the generating sources, in order to generate and use electric energy efficiently, effectively and effectively for the energy market.

3.1 DEMAND MANAGEMENT (LOAD MANAGEMENT)

The iteration of smart grids with the management of consumption and/or use of energy is done with a management operation by the network of the loads that can be controlled from partner customers. Typical examples are the actions of flexibilization of the load curve and the reduction of the peak periods of the electrical energy system. Therefore, it is necessary to have knowledge of the characteristics of use of the production processes and/or services used by the client, of an own intelligence capable of estimating the
potential short-term demands, which will occur on the part of this client. In the case of managing compressed air consumption in an industry or air conditioning in a shopping mall, it is necessary to estimate how much compressed air will be demanded by the production process, which is repeated within a typical load curve demanded by the process, productive. In the case of environmental conditioning, what is the expected frequency of occupancy of the facilities by the customer, depending on the time, day, season and the occurrence of special dates, which will dictate the predictable load curve. Depending on the process or the energy service demanded, the short-term reduction in the production of compressed air or air conditioning does not affect the operational functions of the companies participating in the management process. Logically, this type of integrated action requires tariff compensation for participating customers.

For the concessionaire, the sum of actions of this type makes it possible to modulate the supply profile to the current contracts, without the risk of paying for excess demand. Among the different use and consumption management systems, the following stand out as easy-to-control concentrated loads: Water pumping; Compressed Air Systems; Environment Conditioning Systems; Street lighting; Commercial and Residential Refrigeration Systems. In the rural segment, end-use energy services such as mechanized irrigation, drying and processing of grains, refrigeration and environmental conditioning stand out.

This type of management is characterized, therefore, by a strong action of flexibilization of the profile of the service load curve by the concessionaire, facilitating the optimization of the use of the equipment and electrical energy systems involved.

The case of Peak Period Reduction involves direct actions on instantaneous demand. Today, in the Brazilian electrical system, this is done by a tariff signal, where seasonal customers of group A in medium and high voltage or of the White Tariff for Low Voltage, are urged to minimize their demands at peak times of the electrical system. Both the flexibilization of the load curve and the reduction in the peak particularly encourage the optimized occupation of the energy transmission, transformation and distribution network. On the generation side, it avoids dispatching plants with a low Capacity Factor, such as natural gas-fired thermal plants, which normally have a high operating cost.

4 ENERGY STORAGE (HYDRO, THERMAL AND ELECTRICAL STORAGE)

Initially, thermal processes such as thermal storage of ice, ice water, steam or heated water strongly favored the management of the concessionaire’s load curves. Through actions to fill in the valleys of the load curve, which takes place at dawn and at midday, it is easier to meet the thermal demands generated in periods of idleness of the electrical energy system. Meeting the demands of customers assumes that the production of the energy vector will be decoupled from the use of energy resources in the provision of services or uses in production processes. The great advantage that presents itself for the electrical system is the possibility of determining the beginning of the storage process according to the objectives of managing the load curve by the concessionaire. The network intelligence assumes this control, matching the contractual dispatch of supply for the loads with the availability of the network and the supply contracts.
This modality also contributes to the flexibility of the customers' load curves, through the decoupling of the use of the energy service from the demand and energy requirements for its production, which become feasible with proper management by regional distribution dispatches. A typical example is the promotion of the use of solar thermal collectors, where the production of domestic hot water is done through the use of solar resources, supplemented by electricity or piped gas at those valley times, which are more favorable to the concessionaire's dispatch. Thus, the optimization of company assets is facilitated, contributing to affordable tariffs with the postponement of new investments in energy transport.

This option has evolved by reaching the rural segment, also allowing water reservation in dams and weirs. As shown in Graph 1 of the work by Decourt & DeBarre 2013, this type of storage is a widely dominated technology, as well as having minimal cost throughout its life cycle.

Graph 1: Maturity of Electric and Thermal Storage Energy Technologies

Demand-side management imposes on the concessionaire a high level of knowledge of the characteristics of use and consumption of energy in its market. In rural areas, the thermal requirements, both for heating and cooling, are strongly evident. Thermal storage can ensure most of these requirements, however it must be managed by intelligent systems that assess energy availability and the thermal requirements of each end use. The decentralization of electric energy production raises the degree of reliability of this type of supply, ensuring continuity far superior to that verified today.

5 ENERGY CONSERVATION (STRATEGIC CONSERVATION)

Two actions on the demand management side fall into this category: The implementation of energy conservation programs and the reduction of market seasonality. Both work the load curve as a whole, seeking to minimize energy waste, optimizing energy efficiency. These are actions that little reflect the control by smart grids, however, they make it possible to optimize the use of the electrical grid, delivering energy amounts that adhere to the requirements necessary for the provision of end-use services. The use of
frequency inverters is a classic example of demand control and electrical energy required in motor systems. The field of application reaches practically all socio-economic market segments. The compatibility of natural lighting with artificial complementarity to meet the lighting requirements of indoor environments is another example of the adequacy of electricity demands to the characteristics of the services provided.

In the rural segment, particularly in the processes of mechanized irrigation (flooding, sprinkling, dripping and others), the effectiveness of measures for the rational use of electric energy is proven. Values that exceed 50% of energy savings and demand through the use of the frequency inverter are common. However, this equipment, as well as the entire motor pump set, constitutes a significant investment in the implantation and that requires levels of quality of services practically non-existent in the Brazilian rural environment. The use of smart grids to properly manage the volumes of water that are made for the effectiveness and effectiveness of the irrigation process can be linked to the use of the system to guarantee the safety of the system, inhibiting the theft of this equipment.

6 RATIONAL USE OF ELECTROTHERMIA (ELECTRIFICATION)

Electricity is responsible for the modernization of practically the entire production process as well as the provision of end-use energy services, such as air conditioning, production of heat and cold and others. It acts directly in the monitoring and control of other energy quantities such as solar and wind energy and practically all non-renewable ones. Thus, its intensity of use measures the degree of development of the economy. This allows for an iteration between the other energy sources and the proper use of electricity. It strongly facilitates the modulation and allocation of other energy resources that make possible the rational exploitation of the electrical energy system. Grain drying processes in Brazil have not yet had a significant contribution from innovative technologies of high efficiency such as the use of radiofrequency. Even the hot air supply and grain handling processes still need to be modernized. These are areas that enable agricultural productivity as well as open space for the penetration of high energy efficiency technologies.

7 COGENERATION SYSTEMS (CUSTOMER GENERATION)

Multiple production systems of energy vectors, such as mechanical, thermal force (cold and/or heat) and electricity are classified as alternatives on the demand side, given that their benefits directly reach the final use of energy.

The physical position of many cogeneration installations, as well as the availability of production, which often exceeds the actual amounts of consumption, make it possible to use them through intelligent management technologies for electrical networks. These make it possible to increase the degree of reliability and continuity of supply to specific subsystems, as well as contributing to the reduction of electrical losses in distribution and subtransmission branches due to the inversion of the power flow. Cogeneration has the strong ability to influence the modeling of load curve profiles through the flexibility of regional dispatches. The iteration and integration of supplying agents, based on cogeneration systems,
with the managers of the main electrical energy system is essential to ensure a level of supply to the electrical system with low cost and high operational reliability. As evidenced earlier, cogeneration is one of the highly competitive alternatives in agribusiness. They ensure both electricity and electrical energy needed for the production processes (drying, handling, peeling, polishing, sorting and bagging) as well as thermal energy to ensure the final quality of the product. The two energy sources are complementary and it is up to intelligent dispatch systems to optimize the energy resources involved from the customer's point of view.

8 ALTERNATIVE MARKETING STRATEGIES

Commercialization alternatives comprise, practically, all the actions of the managing agents of the electro-energy system with the market agents, which are the energy users customers. It ranges from tariff alternatives with appropriate cost signals, through iterative measurement and moving on to much more diverse fields such as iteration with other energy sources, in particular natural gas, in the search for efficiency, effectiveness and effectiveness of proper use and rational energy.

SERRA MONT in 1995, from the IBERDROLA Group, from Spain in a lecture at the 5th. The meeting of the Senior Executives of the member companies of CIER was the one that best defined the role of marketing alternatives on the part of electricity distribution concessionaires focused on demand-side management. There he demonstrates the importance that must be given to the knowledge of how the company's customers use energy. The strong involvement of commercialization agents in the prospection of market niches capable of generating new ways of using electric energy, strongly refers to the importance of market databases, now structured in terms of production processes and end-use energy services in detail.

technical, economic, social and environmental, capable of supporting comparative analyzes and assessments on an equal footing with the alternatives on the energy supply side.

9 NEW TECHNOLOGIES AND/OR ECONOMIC USES (NEW END-USES)

The sustainable evolution of a country's economy promotes a reduction in energy density with a consequent increase in electrical intensity in different socioeconomic market segments. This is due to the quality of services provided by the electrical industry, which ranges from generation to commercialization alternatives, including the entire transport, transformation and distribution of electrical energy.

Notably, industrial processes open up opportunities for the adoption of innovative technologies with high energy efficiency, such as radiofrequency at different wavelengths, plasma, electrolysis and other electrical applications, notably involving the monitoring and control of renewable and non-renewable energy vectors. These are characterized by the strong iteration that can result from an adequate management of the load curve through smart grids.

The importance of innovative technologies with high energy efficiency in rural areas was previously highlighted. Not only in agriculture, but also in animal husbandry, these need greater penetration, seeking to ensure productivity. Refrigeration in milk production processes is an example. Today, due to service
deficiencies on the part of rural concessionaires, the Continuity and Quality Indices of the supply of electric energy lack values that can ensure the productivity and competitiveness of production. It is common to lack electricity for long periods, mainly due to weather conditions. The use of decentralized electricity production systems, taking advantage of existing inputs on the property, can ensure this much-needed supply reliability.

10 SMART ELECTRICITY GRIDS

Particularly, in the operation of electrical and energy systems, opportunities are made possible through the monitoring and very short-term forecasting of the load curve profiles of the different socioeconomic segments, allowing a quick decision on the best way to meet the energy requirements of the market.

The adoption of intelligent iteration systems with the customer, in addition to facilitating the billing procedure, makes it possible to assess supply conditions, both from the point of view of continuity and energy quality, facilitating the exchange of messages with the customer's internal network.

The smart grid from the customer's point of view ensures that the final use of energy necessary for the production processes or in the provision of energy services will be carried out with efficiency, effectiveness and effectiveness, as well as in the case of an independent energy producer, that this is properly compatible with the other uses that it may have for the primary input. This is evident in the rural property, where in addition to ensuring efficiency in production processes such as pumping, air conditioning, refrigeration, heating, driving force and others, it enables the adequate shared use of primary resources as in the case of water, where the exploitation of hydroelectricity can compete with irrigation.

The smart grid implemented to ensure customer decision support and allow interactivity with their energy suppliers must have functions such as:

11 INFORMATION AND INTELLIGENCE ACTIONS

• Availability of databases of both the intrinsic variables of the production processes and the market to which the customer is inserted;
• Transform the data collected into information to be used by managers of production processes;
• Preserve the synthesis of the information collected, in order to ensure the history and allow the training of smart grids;
• Have computerized models capable of reproducing the customer's energy use and consumption profile and that can predict the status of production processes and end-use energy services.

11.1 MEASUREMENT AND BILLING ACTION:

• Automate the collection of billing data;
• Detect failures;
• Sending repair teams to the correct location faster;
• Inhibit the theft of energy and equipment;

11.2 MONITORING AND CONTROL ACTIONS:
• Monitor end-use equipment that may have its services made more flexible;
• Able to decide when to consume energy based on customer preferences;
• Reduce peak demands, which have a big impact on energy transport costs.

International experiences demonstrate the feasibility of intelligent exploitation of electro-energy systems in a much broader way than those currently proposed by Brazilian concessionaires, more classified as "smart metering" simply.

Here we can also observe the strong centralization of human resources intelligence in energy distribution by the concessionaires in the so-called Customer Service Centers by concession area. They believe that the speed of communication will enable dialogue with the customer. However, what is observed is that these administrative procedures strongly harm the real knowledge of the market. Typically, a concession area is made up of geographic regions with different aspects of socioeconomic development.

By adopting an integrated approach to serving the market, it is necessary to know the peculiarities of energy use by the different segments or classes of customers. Seeking an effective management from the energy demand side, the relationship between the electro-energy system operation managers and the different classes of customers must be implemented. This implies a real approximation between the concessionaire's commercialization agents and the energy managers of the companies served, supported by access to integrated supply x demand databases and subsidized by technical, economic and environmental decision support models.

The same occurs with the availability of distributed generation, which can compete strongly with situations of risk of breach of purchase demand contracts from suppliers, and/or of improving quality, reliability and production costs.

Energy Management Actions, whether on the Demand side, directing the way in which customers use and consume electricity, or on the Energy Supply side with the dissemination of distributed generation, their implementation has been facilitated, from the use wide range of communication and computerization systems for the operation of concessionaires. Through the bidirectional measurement that evaluates not only the amounts of demand and energy exchanged, but also and mainly the quality of the electric supply, the integration of management actions on the demand side to the operational processes of the electro-energy system becomes highly competitive.

13 CONCLUSIONS

The integration of electrical energy systems, information technologies and the telecommunications network strongly promote and facilitate an integrated vision (supply x demand) of exploitation of energy
resources. The resulting smart grids offer ample opportunities to exploit distributed generation, particularly that arising from cogeneration systems. These are not restricted to mechanical, thermal and/or electrical production, but particularly, that transformation capable of meeting non-energy uses from the primary source that are complementary to the production of electrical energy. This is the specific case of gravity irrigation for agricultural crops (Siphons, Deep Channels and others) which can be associated with complementary hydroelectric generation.

Focusing on low tariffs that must be sought to meet market requirements, smart grids can contribute to replacing the focus on expanding electro-energy systems (generation, transmission, transformation, distribution and ancillary services) with optimizing energy resources and existing electrical systems. The implementation of the White tariff modality for low voltage customers should promote new opportunities for concessionaires to establish demand-side management contracts with their customers. At the same time, it will lead to the emergence of technological innovations aimed at controlling the end-use loads of customers included in this tariff.
However, the organizational, administrative and behavioral posture of electric energy distribution concessionaires in Brazil must undergo a review of their strategic actions.

Table 1 summarizes the differences that are present today in electricity distribution concessionaires and that have long been incorporated in those companies in developed countries. The expansion of electro-energy systems according to the principles of integrated exploitation of electrical and energy resources will allow, in addition to affordability, to contribute to the minimization of the social and environmental impact resulting from energy exploitation.

The difficulties that are posed to carry out this type of integration, such as the multiplicity of actors involved each with their own interests, is not justified as long as it is adopted as a premise that the prices to be practiced effectively reflect the costs involved. Whichever actions must be characterized by “win-win” operations. That way everyone will benefit.

ABSTRACT
Introduction: Biosafety are actions aimed at preventing, controlling, reducing or eliminating risks inherent to research, teaching and technological development activities, essential for health professionals, vulnerable to contamination by biological fluids. In Brazil, the Regulatory Norm n° 32 exists, however, there is a dissociation between the recommended and the practice, due to the large number of occupational accidents. Objective: to evaluate the knowledge, attitudes and practices in biosafety of students of Medicine and Dentistry courses. Method: observational, cross-sectional study, with a sample composed of 294 students from the medical school internship and from integrated clinics of the Dentistry Course, from Higher Education Institutions in Alagoas, Brazil. Data were collected through a questionnaire, evaluated using descriptive statistics and presented as absolute (n) and relative (%) frequencies. The results showed that 85.5% of dental students and 70.8% of medicine students received training on biosafety. Regarding the use of PPE, there was a lower adherence of medical students to the use of gloves (76.9%); cap (40%); goggles (13.8%) and mask (63.1%). The occurrence of occupational accidents was higher among medical students (33.6%), in relation to dentistry (18.1%), and the circumstance with the highest incidence was the accident with a needle. Conclusion: the results allow us to conclude that knowledge about biosafety standards is still limited. Risk behavior resulted in the highest occurrence of accidents in the medical course. It is essential to introduce biosafety in professional education and to include this topic in the curriculum of the courses.

Keywords: Biosecurity. Biological risk. Occupational exposure.

1 INTRODUCTION

Biosafety defines the set of actions aimed at preventing, minimizing or eliminating risks inherent to research, production, teaching, technological development and provision of services, aiming at human and animal health, environmental preservation and quality of the results¹. From the moment undergraduate students first contact hospital environments or even study environments, there is exposure to blood, secretions and other potentially contaminating body fluids.²

The occupational accident with exposure to biological material (ATEMB) is the main factor in the genesis of occupational exposures among health professionals. These accidents are typified as injuries caused by direct contact with blood and organic fluids in the work environment, and occur by percutaneous inoculation, needles or sharp objects, in addition to direct contact with non-intact skin and mucous membranes.
Studies on ATEMB, as well as records of its occurrence, are still deficient in Brazil. In the National System of Notifiable Diseases (SINAN)³, for the period from 2007 to 2013, there are 203,709 cases of accidents due to exposure to biological material, with 76.86% (156,572) of workers in the health sector.

In relation to other countries, there are studies on the incidence of ATEMB, such as one carried out in Massachusetts, in the United States, between 2002 and 2007, where 16,158 cases were registered.⁴ Another study in Italy pointed out that between 1994 and 2013, 99,435 cases.⁵

According to the Centers for Disease Control and Prevention (CDC)⁶, students, laboratory technicians, doctors, nurses, cleaning staff, among others, who perform activities in contact with patients, blood or other organic fluids, in health care environments, laboratories and the like, are considered as Health professionals.⁶

A study carried out in Brazil evaluated the occurrence of accidents with exposure to MB, in 195 students of the Dentistry course. The result showed that 23.6% of the sample had already suffered occupational accidents, and among these, 18.7% sought medical assistance after exposure and 6.3% reported not using personal protective equipment (PPE) at the time of the occurrence.⁷

Although there is a regulation in force in Brazil since 2005, the Regulatory Norm 32 (NR 32)⁸ and recommendations from international bodies such as the CDC, in practice there is still a lack of knowledge and dissociation of what is recommended in relation to clinical routine, which leads to There is a large number of occupational accidents among students in the health area, especially in Medicine and Dentistry courses.⁷,⁸

Thus, the objective of this study was to evaluate the knowledge, attitudes and practices in biosafety of academics of Medicine and Dentistry courses.

2 METHOD

An observational, cross-sectional and quantitative study was carried out. Data were collected in Higher Education Institutions (HEIs) in the city of Maceió/AL, in Dentistry (one public and one private HEI) and Medicine (two public and one private HEI) courses.

The study included students who were duly enrolled in the Dentistry and Medicine courses, who were already participating in courses with clinical hours, in January 2019. Data collection involved the application of a structured questionnaire with 26 multiple-choice questions. Questions about regulatory norm 32, standard precautionary measures, use of personal protective equipment, vaccination schedule, occurrence of work accidents, procedure and instrument involved in the accident, conduct after the accident and knowledge about its prevention were elaborated.

The collected data were tabulated in electronic spreadsheets (Software Microsoft Office Excel ® 2013), transferred to the SPSS Statistics Software (StatisticalPackage for the Social Science, version 20.0, Inc. Chicago, IL, USA) and analyzed using descriptive statistics, being presented in the form of absolute
(n) and relative (%) frequency. For numerical variables, the mean and standard deviation were calculated. A significance level of 5% and a confidence interval of 95% were considered.

The research was approved by the Research and Teaching Ethics Committee of the Centro Universitário CESMAC. The importance and objectives of this study were explained to the volunteers and those who agreed to participate did so by signing the Free and Informed Consent Term (FICT).

3 RESULTS

A total of 294 students participated in this study, 93 (31.6%) male and 201 (68.4%) female. Regarding the course, 166 (56.5%) were from the Dentistry course and 128 (43.5%) from the Medicine course. The age range of the sample ranged from 18 to 45 years, with a mean age of the Dentistry course of 24.8 ±4.68 years and of Medicine 26.4 ±4.69 years.

When asked if they had received information about NR 32 or about Standard Protection Measures (MPP), most students responded positively. However, when asked if they knew, most students answered “no” or “I don't remember”. With regard to knowledge about Standard Protection Measures, a greater number of students responded in the affirmative. (Table 1).

Direct contact with the patient during practice requires hand washing to be carried out in accordance with what biosafety agencies recommend, in order to avoid cross-infection. In this research, when students were asked about hand hygiene training, they responded positively.

In this research, it was found that 46.1% of medical students reported washing their hands before and after wearing gloves, while among dental students this habit was 78.9, and this practice is recommended by NR-32 (Table 2).

In the present study, the students' practice regarding the exchange of procedure gloves was evaluated. The results showed that 85.5% of dentistry students and 78.9% of medical students change gloves after each appointment, which is recommended by current regulations. It is noteworthy that part of the students admitted to changing gloves only if they are dirty, as well as accessing the medical records, furniture or telephone, even using gloves, which increases the risk of cross-contamination. (Table 3).

Regarding the use of PPE, it was found that the frequency of use of gloves, hat, goggles and mask was higher among dental students. Attention is drawn to the low adherence of medical students to the use of goggles, hats and lab coats. (Table 4).

As for the availability of adequate material for hand hygiene in clinical practice settings, 48.4% of the medical course students answered that they do not remember, while 60.2 % of the dentistry course students stated that the material exists in the practice place (Table 5). With regard to the presence of disposable PPE in practice places, a requirement of NR-32, 25.8% of medical students responded that they are not available.

Regarding the occurrence of accidents with exposure to biological material, in this study, the medical course had the highest incidence (33.6%), while in the dentistry course it was 18.1%.
With regard to the circumstance in which the accident occurred, it was found that in both courses, the situation most pointed out by the students was the accident with a needle, which occurred mainly during the procedures of suturing, anesthesia and recapping/disposal of the needle. Among medical students, accidents caused by splashes of body fluids stood out. (Table 6)

4 DISCUSSION

Regulatory Norm 32 classifies as “health services” any building intended for the provision of health care to the population, and all actions of promotion, recovery, assistance, research and teaching in health at any level of complexity. 8

The results of the present study showed that knowledge about biosafety norms is limited, and that they are not observed with due importance. This is fundamental at graduation, especially when students begin their insertion in practice scenarios. The absence of a prevention culture allied to the absence of normative knowledge is a preponderant factor for the exposure of students to accidents with biological material, as demonstrated in the studies already carried out. 9,10,2

Since 2005, Brazil has a regulation specifically aimed at workers in the health sector, the Regulatory Norm 32. 8 Knowledge of and respect for this regulation results in benefits in terms of productivity, minimization of potential health risks, reduction of morbidity, mortality and absenteeism. Its effective implementation contributes to essential behavioral changes in the prevention of accidents. 11

Regulatory Norm 32 provides that all Institutions must ensure training for all who are performing actions in environments where health-related actions take place, before the start of these activities and on an ongoing basis, even adapted to the evolution of knowledge. 8 This seems to be a common practice in the evaluated HEIs, considering that 79.6% of the evaluated sample had received training before entering the internship and integrated clinic.

In addition, NR 32 guides that in every place where there is a possibility of exposure to biological agents, written instructions must be provided, in accessible language, of the routines carried out in the workplace and measures to prevent accidents and work-related diseases. 8 In this sense, it is essential that educational institutions produce and make their biosafety manuals accessible. In the present study, although it was observed that Higher Education Institutions have biosafety manuals, students are not familiar with reading them. This behavior contributes to the increased risk of occupational accidents.

Pereira et al., concluded in their study that there is a need to broaden the debate on biosafety, in hospitals, laboratories, and also in research and teaching, and that the number of publications on the topic in the national scientific literature is small, especially in regarding graduation in health. 12

In 2004, the World Health Organization (WHO) created the World Alliance for Patient Safety, which defined international goals, among them, the reduction of the risk of infections combined with health care, with emphasis on hand washing. 8, which is considered a primary preventive measure of the National Patient Safety Program. 13
Direct contact with the patient during practice requires hand washing to be carried out in accordance with what biosafety agencies recommend, in order to avoid cross-infection. As well as hand hygiene, the use of gloves is a measure of great importance in preventing the transmission of microorganisms to the patient and the professional.  

Al-Essa and Almutairi observed that most students (97.7%) had the habit of changing gloves between patients, however, only 67% of them admitted to washing their hands with each glove change. Apparently, students have the false feeling that changing gloves between sessions is enough to avoid cross-contamination.  

According to NR-32, the use of Personal Protective Equipment is mandatory in all procedures and they must be available in the sectors that are necessary in health establishments, and it is up to the professional to use them for their own protection and that of patients.  

Health Care-Related Infections (HAI) are defined as those acquired during the provision of health care, whose spread often occurs through cross-contamination.  

Other studies have observed similar results to this research, showing that the frequency of PPE use by dental students is above 90%. In the study by Mccarthy and Britton, the prevalence of occupational accidents in students in the last year of dentistry and medicine courses was evaluated. The authors reported that the habit of using PPE was more present in dentistry students. The behavior observed in medical students, in relation to the low frequency of use of PPE, contributes to the increase in the occurrence of occupational accidents.  

The guidance of NR-32 is clear in this regard, and provides that one should not leave the place where the activities are carried out, with the personal protective equipment and clothing used in their work activities.  

In a study carried out on the possible contamination of coats of Nigerian doctors, Uneke and Ijeoma, observed that the coats used in out-of-hospital settings presented a higher level of contamination in relation to those used only in care environments. The results suggest that physicians’ lab coats may increase nosocomial transmission, and that proper handling of the garment by healthcare professionals could minimize cross-contamination and improve safety, potentially reducing these infections.  

As for the availability of adequate material for hand hygiene in clinical practice settings, this study shows important data, demonstrating that there is disagreement with normative guidelines, which determine that all places where there is a possibility of exposure to biological agents, should there is an exclusive washbasin for hand hygiene, provided with running water, liquid soap, disposable towels and a trash can equipped with an opening system without manual contact.  

Health Services, as a work environment and teaching practices, are particularly characterized by risks for health professionals, the main one being represented by biological accidents, associated with the parenteral transmission of pathogens.
The results found in this research are similar to those found in other studies. The report of high rates of occupational accidents in undergraduates in the health area is common. Al Essa and AlMutairi, evaluated 303 dental students in Saudi Arabia and observed an occurrence of occupational accidents of 65%, most of them caused by needles. Mccarthy and Britton studied the occurrence of occupational accidents in students who were in the last year of medicine, dentistry and nursing courses. A higher frequency of occupational accidents was found among dental students (82%), when compared to medical students (57%).

In our study, the higher rate of occupational accidents involving medical students seems to reflect the risk behavior observed in this sample (ignorance of the course's biosafety manual, lower adherence to the use of PPE, incorrect practice of hand hygiene and use of lab coat outside the workplace).

Stefanati et al., in a study carried out at the University of Ferrara, in Italy, investigated the characteristics of biological accidents among Resident Doctors at that teaching hospital. During the analyzed period, there were 190 accidents, 81% of which were due to percutaneous injuries and blood was the biological fluid involved in 86.3% of the cases. The most frequent injury was caused during puncture (62.6%), and in 41.1% of the cases, the accident occurred by needles during the suture procedure.

According to Rocha and Fartes, the absence of tools that allow, during the training phase of professionals, the development of a perception of the risks, and the knowledge of their prevention forms, constitutes an important gap to be filled through training programs that aimed at the construction of knowledge, through an interdisciplinary methodology, joining efforts and socializing the information that the topic covers.

Basso and collaborators, evaluated the effectiveness of a prevention and training program to reduce occupational accidents caused by biological material in a teaching hospital, based on the incidence of 1445 occurrences during the eight years of its implementation. Of the accidents with piercing or cutting instruments, 47.5% were due to improper disposal of potentially contaminated materials. An annual drop rate of 0.21% in percutaneous accidents and 0.36% in percutaneous accidents due to inadequate disposal was observed, after the implementation of the Program, showing the importance of continuing education.

The results of this study indicate that the lack of knowledge regarding biosafety norms, combined with the practice of risky habits, seems to contribute to the occurrence of occupational accidents during graduation.

5 CONCLUSION

The application of biosafety standards at graduation is essential for everyone involved in teaching and in the routine of health services. It is essential that there is a frequent approach to this topic as continuing education. Preparing professionals who are more aware of accident prevention and safe behavior will enable
a positive intervention with the objective of reducing the occurrence of occupational accidents with exposure to biological material.

Considering the number of accidents among students in the health area and the insufficient adherence to the use of PPE, the requirement to use these can be an effective measure.

In addition to the importance of notifying and monitoring occurrences, it is necessary to raise the awareness of everyone who is in the practice scenarios, so that they adopt the existing protocols and all measures to protect and prevent these events. The Regulatory Norm Nº 32, which deals with safety and health at work in these environments, is a great advance to change this scenario.

In addition to the occurrence of the occupational accident, its consequence is another factor that needs to be considered and addressed with greater vehemence, since the adherence of the injured to post-exposure follow-up consultations to biological material, present a high rate of abandonment until medical discharge.

In view of the data obtained in this research, some recommendations are suggested, such as the insertion of the biosafety theme in undergraduate courses, in a transversal way, constant training for students and teachers in service, mandatory disposable Personal Protective Equipment (PPE) and hygiene materials in the practice sites, in addition to the guidelines regarding the mandatory notification of accidents and the flow to be followed in the event of an accident.

ABSTRACT
The contemporary consumer has sought to consume foods that not only satisfy their taste, but that can also add something to their health. In this sense, functional foods, and those rich in antioxidants, have gained prominence due to their ability to fight free radicals, which in turn are precursors of various diseases. In this context, we have João Gomes, an easy-to-grow vegetable, rich in several minerals and promising antioxidants, widely consumed in Maranhão cuisine in dishes such as chicken stew, meat stew, rice, and stir-fries. In order to provide more information about this vegetable, a comparative study of the antioxidant activity of the leaves and stems of João Gomes was carried out. By the DPPH method. The antioxidant activity of Talinum triangulare (Jacq) willd was determined by obtaining methanolic extracts from the leaves and stems of the species, using Rutin as a standard. The results obtained showed that the João Gomes stem extract showed a higher percentage of DPPH inhibition, with 70%, compared to the 50% inhibition obtained by the leaf extract, and the Rutin pattern showed 60% inhibition. Thus, it can be considered an important source of antioxidants in food.

Keywords: Antioxidant, João Gomes, Functional food, DPPH.

1 INTRODUCTION
Leafy vegetables represent one of the most important food sources for man, because in addition to containing the nutrients necessary for food, such as minerals, vitamins, fibers, bioactive compounds, among others, their cultivation is well developed in tropical and subtropical areas of the world. Dark green vegetables have been recommended as they present a natural source of ascorbic acid, thiamine, riboflavin, carotenoids and minerals such as calcium, iron and phosphorus (Carvalho, 2009).

The consumer in contemporary society has been concerned with the promotion of health, with the quality of life, and thus seeks for a healthy diet. This interest has resulted in gathering information about the biological value of foods and the effect of their nutrients on the body. Within this context arise the
functional foods that, if consumed regularly, provide a beneficial effect on health. Examples of these functional foods are *Talinum triangulare (jack) willd*.

*Talinum triangulare (jack) willd* is popularly known as joão gomes, bredo-major-gomes, manjogome, maria-gorda, purslane grande, among others (Vieira, 2014). They are perennial plants generally found in tropical environments, adapting well to hot and humid local weather, as well as to low soil fertility, which makes their cultivation an important economic activity for small producers, as they do not require high costs for their production. production (Amorim, 2007). The genus *Talinum* develops in several regions, undemanding regarding environmental and climatic conditions, it is considered most of the time as a weed, as it grows spontaneously among cultivated plants, on the side of roads and vacant lots, (Carvalho, 2009).

Due to its rusticity and vigor, it is widespread in Brazil, from North to South , (Embrapa, 2017) having been recorded in the states of Maranhão, Amazonas, Pará, Ceará, Pernambuco, Sergipe, Bahia, Minas Gerais, Espírito Santo, Rio de Janeiro, São Paulo, Paraná, Santa Catarina and Rio Grande do Sul, (Rodrigues and Furlan, 2002). In the northeast it is widely consumed in the eastern region of Maranhão. In the northern region of the country, it is consumed mainly in the states of Amazonas and Pará, due to its high nutritional content, and can be used in infant feeding as a substitute for spinach (Amorim, 2007).

Based on mineral content analysis, Manhães et al. (2008) mentions that João gomes can be considered an excellent source of iron, zinc and molybdenum, and the consumption of 200g/day of this food would meet the daily needs of these nutrients. It also highlights the content of selenium and manganese, where 100g/day of fresh João Gomes could provide, respectively, two to three times the amount recommended for adults by international health bodies. Currently, the plant is little known to the vast majority of the population. It was once quite common in Bahia, possibly being part of typical dishes, such as caruru. Even so, it is still found sporadically at fairs. Exception to the North region, where particularly in Amazonas, it is systematically cultivated by horticulturists and found in fairs and supermarkets (Embrapa, 2017).

In cooking, it can be used almost completely, with the exception of the roots, which are bitter and hard. The stem and leaves are crispy and have a sweet and sour taste. The leaves can be cooked and consumed as vegetables, preserved in vinegar (Amorim, 2007). In Maranhão cuisine, it is widely consumed in chicken and meat stews, in rice and also in stir-fries. The species can also be used in the preparation of breads, stews and creams. In home medicine, the leaves are used in the form of a poultice against skin conditions, wounds and inflammations and the infusion of the roots is considered a diuretic, but its effectiveness is not scientifically proven. Regarding the nutritional aspect *Talinum triangulare (jack) willd* is a rich source of omega-3 fatty acids, which are considered very important for preventing heart attacks and strengthening the immune system (Vieira, 2014).

According to the World Health Organization (WHO) the average consumption of vegetables recommended per day, per person, is 400g. In Brazil, research has shown that this consumption is
132g/person/per year, raising the obesity rate by 43% in young people under 21 years of age and adults and providing an increase in the percentage of heart disease (31%), stroke (11%) and gastrointestinal cancer. Therefore, there is a need to triple this level of consumption, thus promoting consumer health (Carvalho, 2009).

In recent years, great interest in the study of antioxidants has occurred, mainly due to discoveries about the effect of free radicals and other oxidizing agents in the body. Free radicals are unstable and very reactive molecules, which are precursors of many degenerative diseases associated with aging, such as cancer, cardiovascular disease, cataracts, immune system decline and brain dysfunction (Ramos et al, 2011).

Among the classes of naturally occurring antioxidant substances, phenolic compounds have drawn attention due to their reducing properties. This characteristic plays an important role in the neutralization or scavenging of free radicals and chelation of transition metals, acting both in the initiation stage and in the propagation of the oxidative process (Sousa et al, 2007).

However, the endogenous antioxidants produced by the human body have partial efficiency, thus making it necessary to ingest exogenous antioxidants through the diet, which can be found in plants (Perin and Schott, 2011). Thus, the antioxidants present in vegetables for health maintenance and disease prevention are of great interest to scientists, food industries and consumers, as the future market moves towards functional foods with specific health effects. (Carvalho, 2009).

One of the methods used for the determination of antioxidants is the in vitro photocolorimetric method of the stable free radical 2,2-diphenyl-1-picryl-hydrazyl (DPPH), using rutin as a positive control. The method consists of monitoring the consumption of the free radical DPPH by the samples, through the decrease of the absorbance measure, (Ramos et al, 2011).

In view of the potential of Talinum triangulare (jack) willd as food and in medicine, since it is an easy-to-grow vegetable, important for human health, as it allows the diversification of the food diet, since it has high concentrations of iron, magnesium and calcium, in addition to being the unconventional vegetable, among the 69 species studied by Kinupp and Barros (2008), which presented the highest concentrations of zinc (22.9 mg/100g) and potassium (6,800mg/100g), high protein concentration (Biondo et al, 2017), an abundant species in the state of Maranhã and promising antioxidant compounds. Thus, this work aims at the comparative study of the antioxidant activity of extracts of leaves and stems of the species Talinum triangulare (jack) willd by the DPPH method.

2 MATERIALS AND METHODS

2.1 COLLECTION OF PLANT MATERIAL

The leaves and stems of the species Talinum triangulare (jack) willd were collected in the municipality of Imperatriz in the state of Maranhão, in October 2019 and deposited in the UEMASUL herbarium.
After sorting, the leaves were separated from the stem. Then, natural dehydration was carried out at a temperature of 18°C for 13 days. Then, both leaves and stems were dried in an oven with air circulation for 24 hours, at a controlled temperature of 40°C.

Subsequently, the leaves and stems of the species were ground in a Technal ® willye-type knife mill.

2.2 OBTAINING THE EXTRACT

The extract of the leaves and stem of the species was obtained from 12.88g and 10.40g of plant material, respectively. Then, the plant material was transferred from the leaves to a flask and from the stem to another flask, and 100 mL of methyl alcohol was added to each flask. These were left to rest for 24 hours protected from light in an airtight container, and then filtered through filter paper. The filtrate from the leaves, as well as that from the stem, were collected in other containers, which were hermetically closed and sent for refrigeration in the refrigerator at a temperature of 8°C. The residues were transferred to other containers and 100 ml of methyl alcohol were added to each one again, and the filtration and conditioning of the filtrate began. This procedure was repeated with the filtrate residue from both leaf extract and stem extract, twice more.

After obtaining the three filtrates from both leaves and stems, they were concentrated in a rotary evaporator for 10 min at 40°C.

2.3 DETERMINATION OF TOTAL ANTIOXIDANT ACTIVITY BY DPPH FREE RADICAL CAPTURE.

A stock solution of the standard (rutin) of 4mg/mL in methyl alcohol was prepared. From this solution, the dilution was performed, using aliquots of 2, 1, 0.5 and 0.25 ml of this solution, corresponding to 4, 2, 1, 0.5 mg/mL of rutin, respectively. In each of these volumes, 2 ml of the 0.004% DPPH solution was added.

From the methyl extract obtained from the leaves and stem of *Talinum triangulare (jack) wild* or popularly João gomes, a solution of the leaf extract, as well as the stem extract, of 4mg/mL was prepared, that is, dissolved 16 mg of both leaf extract and stem extract were added to 4mL of methyl alcohol and diluted, using aliquots of 2, 1, 0.5 and 0.25 ml of each solution, respectively.

2mL of the 0.004% DPPH solution was added to each concentration of extract from both the leaves and the stem. After the addition of DPPH, it was left to react for 30 minutes in the dark and the absorbance was read in the HP series 8453® spectrophotometer at 517nm, in quartz cuvettes, in front of water.

From the final concentrations obtained and the respective absorbance readings, the graph was constructed by plotting the average value of the absorbances obtained versus the concentration of the solution.
The ability to scavenge the DPPH radical (% antioxidant activity) was calculated using the following equation:

\[
\text{% Inhibition} = \left( \frac{\text{ADPPH} - \text{AExtr}}{\text{ADPPH}} \right) \times 100
\]

Where:
- ADPPH is the absorbance of the DPPH solution;
- AExtr is the absorbance of the sample in solution;

3 RESULTS AND DISCUSSIONS

When determining the antioxidant activity of *Talinum triangulare (jack) willd* against DPPH, the values of the percentage of inhibition of DPPH by the extracts and Rutin standard were obtained. The results obtained showed that the highest percentage of DPPH inhibition by the stem extract was above 70% at 4 mg/ml concentration and above 20% at 0.25 mg/ml concentration of the sample. While the rutin pattern showed a percentage of DPPH inhibition above 60% at 4 mg/ml concentration and above 40% at 0.25 mg/ml concentration, as can be seen in Graph 01. The concentration of the João gomes stem extract was higher in its antioxidant percentage, thus being able to be considered an important source of antioxidant, which can be used both as a natural food with good values of antioxidant activity and as a raw material for the production of rich processed foods. in antioxidants. A similar study carried out by Amorim (2007), when evaluating the antioxidant activity of *Talinum Triângulare stem* against DPPH, revealed that the crude extract showed a free radical scavenging activity with an EC_{50} value = 526 µg/mL. Gonçalves (2015), when studying the effect of planting and harvesting time on the total phenolic content and antioxidant activity of *Talinum triangular (Jacq.) Willd* compared to DPPH, observed that the antioxidant activity of plants varied significantly between different planting times and between different harvest times, reaching 56.97% in plant extracts produced in winter and harvested 30 days later. the planting. An extract with a concentration of 80 µg mL^{-1} close to the EC_{50} obtained for the species was used, this result implied that the profile of *T. triangulare polyphenols* can influence the antioxidant activity of the plants, since the highest levels of phenolic compounds were obtained in the same samples.
On the other hand, the extract of the leaves of João Gomes, obtained values of percentage of inhibition of DPPH lower than the values obtained of percentage of inhibition of DPPH both by the stem extract and by the Rutin standard. Since it showed a percentage of inhibition of DPPH above 10% at the concentration of 0.25 mg/ml of the sample. While the standard rutin obtained above 40% in the concentration of 0.25 mg/ml. It showed better results when at concentrations of 2 mg/mL and 4 mg/ml, when it obtained a percentage of inhibition of DPPH above 40%, which is closer to the values obtained by the stem extract and also from the rutin standard. According to Biondo (2017), Puhl et al. (2017) when evaluating the presence of flavonoids (7.29 ± 0.284 mg/g) and phenolic compounds (68.40 ± 2.93 mg/g) in *Talinum paniculatum leaves extract* obtained similar results. These data suggest that the low content of phenolic compounds and flavonoids known to be antioxidants are responsible for the low antioxidant capacity of the extract of João Gomes leaves. However, Francisco (2014) when carrying out tests with the forms of leukemic strains HL-60, K562, Lucena (K562 resistant to vincristine), H460 and JUKART using the hydromethanolic extract of *Talinum triangulare leaves* showed significant results, observing an inhibition of 60% for the highest concentration used (1 mg/mL) in HL 60 cells, with IC$_{50}$ = 0.43 mg/mL.

As with the study carried out, the stem of *Talinum triangulare (jack) willd* showed greater antioxidant activity than the leaves of the species, since the stem extract obtained its highest percentage of inhibition of DPPH above 70%, while the extract of the leaves was around 50% when compared to the routine pattern. However, although *Talinum triangulare (jack) willd leaves* showed lower antioxidant activity than the stem of the species and the rutin pattern, it still proved to be an important source of antioxidants, which can be applied in different food segments.
4 CONCLUSIONS

From the determination of the antioxidant activity of *Talinum triangulare (jack) wild* by the DPPH method, the results obtained showed that João Gomes has a high antioxidant activity compared to the antioxidant activity of the standard rutin. Since the sample of the stem extract of the species generally presented values of percentage of inhibition of DPPH equal to or greater than the values obtained by the rutin standard. On the other hand, the extract of João Gomes leaves, although it presented results of percentage of inhibition of DPPH lower than the values obtained by both the stem extract and the rutin standard, it can still be considered a source of antioxidants when compared to the rutin standard.

Thus, through the study carried out, João Gomes proved to be an important source of antioxidant in food, especially when its stem is consumed. Which is a very important result, taking into account the role of antioxidants in fighting various diseases, in addition to being able to further enrich the nutrient diet of the people of Maranhão, since this vegetable is abundant in the region and little used, often for lack of knowledge of its nutrients. Thus, it is a promising vegetable in food technology both as a natural food and as a raw material for the production of processed foods, such as cookies, cookies, breads, among others.
REFERENCES

ABSTRACT

Human food is governed by geographic, religious, and historical facts. These values shaped food culture, leading to perceptions and adoption of their sensory attributes, characterizing the knowledge and flavors of Mexican cuisine. Mexico is an example of a country with great cultural miscegenation, where the native indigenous culture in contact with Spanish gastronomy, mixed local and foreign foods, got to know foods and new culinary techniques, and adapted, and propitiated the emergence of Mexican mestizo gastronomy. An important part of this food culture is the candy, governed by indigenous precepts and traditions, added to European techniques and recipes. The identity of this hybridization created a unique scenario, different from the rest of the world, where sweet is suppressed by other stronger and more striking sensations, such as sour and spicy. The problem is that this topic is not widely addressed in the academic gastronomic universe, where part of the information that is already so scarce is transmitted orally or informally, bringing risk to the effective perpetuation of Mexican gastronomic knowledge, where the registration of cultural values is a fundamental component for the consolidation of gastronomy as an intangible heritage in the historicity of humanity. This work aimed to carry out a bibliographic review on Mexican sweets, permeating their history and origin within the Mexican food culture.

Keywords: Mexican Candies; Gastronomy; Food Culture.

1 INTRODUCTION

Traditional Mexican Cuisine has factors that go beyond transforming food, involving religion, indigenous rituals, and local traditions, which remain alive to the present day, leading to the formation of the cultural pillars that sustain Mexican gastronomy, indigenous heritage, and European influence, marked mainly by the Spaniards. These pillars were erected by the fusion of ancient knowledge that transformed and enriched the different stages of colonization and miscegenation of the native with the Spanish colonizer (Veloso et al., 2019).

Among the most important cuisines in the world are the Mediterranean diet and Mexican, French and Japanese cuisines, which are tourist trades for their peculiar dishes, which is why in 2010, due to the cultural and social importance of cooking to humanity, the United Nations Educational, Science and Culture Organization (UNESCO), recognized regions characteristic of these four food systems as Intangible Heritage of Humanity.

National gastronomy is that is considered typical and everyday of a country, not considered as an expression of regional individuality, but as an aspect of the group's identity and the region to which the individual belongs (Pérez, 2018). In Mexico, "sweet" is a universe of sensations that encompasses a wide
range of phenomena, ranging from the natural sensation of taste to the culture of preparations, which through works of literature, blocks of songs, tales, popular proverbs and legends, converge to the consumption of a delicious traditional sweet (Reyes, 1990; Acle & Montiel, 2018; Freixa & Chaves, 2017).

The sweet culture in Mexico is very fascinating, because it begins with the use of honey by indians who sweetened their drinks, especially those made from corn in proportions that matched according to local preferences. The natives also consumed other natural sugars, such as agave honey (atypical plant of the region), which were added to fruits for consumption and the agave itself, which was mixed with pumpkin seeds and amaranth, consumption practices foreign to European, because it harmonized the peculiar of sweet with unusual tastes to European sweets of the time (Freitas et al., 2022; Rivera, López & Riviera, 2020).

Mexican sweets are also consumed at traditional festivals across the country, and is no different on Los Muertos Day, or Day of the Dead, which is a feast of worship of the dead in the liturgical calendar. The death cult is one of the oldest celebrations in Mexico and from the sixteenth century, when the colonial world brought the idea of heaven and hell to indigenous peoples, generated a festive bellretism that is preserved to this day. The celebration of the Day of the Dead is the greatest of Mexican festivities, when the Mexican even mocks death, but on that date venerates and respects his ancestors.

The origins of the death cult in Mexico lie in Mesoamerican societies called pre-Hispanic or pre-Columbian, Nahua peoples, such as the so-called Aztecs or Mexicas. The celebration of the dead were concentrated between August 8 and 28 (entries of the ninth and tenth month of the calendar, counted every twenty days), and were related to hope in the harvest of corn, pumpkin, chickpeas, beans, among other vegetables. Fearing that the ice would destroy the plantations, they celebrated with offerings and sacrifices. The so-called feast of Miccailhuitontli was dedicated to dead children, and preceded the celebrations dedicated to the adult dead, which were marked by dances, props such as feathers and jewels, plenty of food and drink and permission for drunkenness. It was believed that the dead person was still alive in the Kingdoms of Death, where he went depending on the type of death: natural, by accident, by sacrifice. From the colonial Conquest, the festivities of the dead have merged with the calendar of celebrations of the Catholic Church, but the Mexican way of celebrating their dead, originated in the nahua belief system, remains in the 21st century, including suffering new formations, such as the cult of The Holy Death (Moreno, 2013).

The dead who return to reappreciate life receives from offering stews, breads, sweets, wine and cigars, affectionately offered by family members. An immense variety of sweets, mainly breads, lent their dough to sculptural forms with the image of skulls, representing the living dead, animals and plants that are related to the death cult depicted in the pan de muerto, or traditional dead bread.

In Mexican food culture, the consumption of sweets daily presents very expressive numbers, with about 38% of adults consuming sweets daily and with children and adolescents presenting a rate of 60% of daily consumption of these products (Pineda et al., 2018). The large consumption is more concentrated in
urban localities, with the ease of acquisition of industrialized products (Ramirez et al., 2020). Sweets are important for both the country's culture and economy, with confectionery and sweets being the seventh most exported ethnic product by Mexico, with Italy, Chile and the United States as its main destinations (Acle & Montiel, 2018; Morrone, 2019). Thus, the objective of this work was to analyze sweets as a tool of Mexican social identity, considering cultural hybridization during its culinary resignification.

2 METHODOLOGY

The methodology is composed of the procedures adopted to conduct a literature review, as recommended by Pereira et al. (2008), which provided theoretical support regarding the way of addressing existing research on the theme "Mexican Sweets". The type of review chosen was the narrative, associated with an ethnographic field research (Souza, Silva & Carvalho, 2010; Szeremeta, 2017).

The strategy of searching for articles in this review comprised a search in databases of the Journal Capes, LILACS (Latin American and Caribbean Literature in Health Sciences), SciELO (Scientific Electronic Library on Line) and Google Scholar, without time delimitation. The search was conducted in Portuguese, English and Spanish.

3 RESULTS AND DISCUSSION

Food is so important and identifying a society, a group, a country, as well as a language, functioning as one of the most important channels of communication. To eat is to exist as an individual, as a history, as a culture, giving meaning of belonging to a community, to a people. Eating does not only represent the fact of incorporating important nutritional elements for our organism, it is first and foremost a social act and, like every relationship that takes place between people, brings conviviality, differences and expresses the world of necessity, freedom or domination (Veloso et al., 2019; Freitas et al., 2022; Suremain & Katz, 2009).

In this context, Mexican sweets have an intense relationship with the identification of the people as a nation, in the way that the country's sweets were built, which is the result of the miscegenation of European techniques and ingredients with native insums. What is noteworthy in Mexican sweets is the profile of flavors found, where stronger flavors such as sour and acid have their protagonism to the detriment of the characteristic sweetness of much of Latin America. These flavors are presented in the sweets because they were present in the palate of the native Mejicas, natural inhabitants of the Mexican territory, who frequently consumed cocoa infusions and fermented products.

One of the main Mexican sweets is cajeta (Figure 1), which is a milk candy based on mixed cow's milk and goat's milk, added with vanilla. As in all Latin America the culture of making sweet milk came with the European colonizer and spread throughout all the colonies, making all Latin American countries have expressions of what would be the sweet milk with its regional nuances. The Mexican cajeta is the expression of the period of sugar production in the eighteenth century, which permeated Mexico, being one
of its strongest remnants of the presence of the colonizer, because this is really sweet even for the palates of Brazilians.

Figure 1 - *Cajeta* mexicana.

Source: Autores (2020).

The *cajeta* derived a regional sweet from northern Mexico, very famous and consumed also in the south of the United States, called *glorias*. This candy consists of *a more* consistent cajeta, added from walnuts and packed like a candy, as noted in Figure 2. The *glories* bear this name, because, according to the oldest, they were produced and sold by nuns in convents and named it so for being as good as a glory of God.

Figure 2 - *Gloria*, typical northern er.

Source: Autores (2020).

Dealing with convent sweets, *the obleas* are hostesses (water and wheat flour) that, when not consumed in the cults of catholic churches, were reused to make simple candies. The confection consisted of taking two hosts and filling with some sweet and *can be cajeta*, marmelada or any other sweet, making a kind of sweet host sandwich. Currently, the *obleas* are made in different sizes and colors and can be
purchased in supermarkets all year round (Figure 3), filling the eyes and souls of tourists with these precious Mexican sweets, so tempered with faith and compassion.

![Image of obleas](source: Autores (2020)).

The *gomitas con chili* (spicy jelly beans) in Figure 4, are a complex experience, in the view of foreigners and connoisseurs of the gastronomy of the world. It is a jelly bean that is made in traditional flavors such as tamarind, mango, pineapple, strawberry and peach, which would be relatively normal flavors if it were not for the fact that they have on their surface instead of *traditional sugar, chili* (pepper) powder, totally modifying the taste and taste perception of sweet. The most traditional are mango *con chili* and tamarind *con chili*.

![Image of gomitas con chili](source: Autores (2020)).

Another very relevant aspect in Mexican food culture is the adaptation to spicy. Children from an early age are accustomed to *consume chili daily* in their meals and their typical sweets: in addition to the
aforementioned jelly beans, there are *palettes with chili*, which are lollipops with pepper (being more traditional tamarind) and cotton candy with chili. Another controversial custom is when the newborn does not accept pacifiers, instead of passing sugar or honey, as is customary in Brazil, in Mexico the pacifier is iced in chili powder, thus making the acceptability of this delicacy already beginning from an early age (Ávila, Tena & Ocegueda, 2009).

Added to the custom of making jelly beans, lollipops, cotton candy and spicy candies, there is a habit of eating the fruit candy in bar with a topping of chili pepper, such as strawberry jam sliced *with chili*, marmeladas sprayed *with chili*, fig, peach and tamarind sweets with *chili* (Figure 5).

![Figure 5 - Dulces with chili.](source: Autores (2020))

Mexico has in peanuts its most consumed oilseed (Freitas et al., 2022), and this is widely marketed and sold in the form of sugar and *chili, very common* in the street trade throughout the country, where it is known as *cacahuate with chile* (Figure 6). In addition to this, it has as very traditional the sugar lump with peanuts, which is a Sweet Spanish, but widely accepted by the population of the country (López, 2004).

![Figure 6 - Cacahuate or peanuts sold on the market.](source: Autores (2020)).
Peanuts are also *made the mazapan* (Figure 7), a very popular sweet that is made by pressing this ingredient with sugar and corn starch, whose consistency resembles the Brazilian paçoca, but has a softer peanut flavor and greater presence of sugar. Peanuts, native to the Americas, was in the luggage of settlers to the European continent and made a big difference in international sweets. In Brazil, it is a mandatory ingredient in june festivals in different Brazilian regions (Ribeiro, 2006; Silva & Silva, 2019).

![Figure 7 - Mazapan.](Image)

Source: Autores (2020).

The *owners (donuts) or sweet donuts* are a typically North American invention, but it became popular throughout northern Mexico, a region bordering the United States, where *the consumption of donuts exceeds that of many American* states, evidencing the great appreciation of Mexicans for this delight of American industry, which is merged with the strong influence of the basic flavors present in Mexico (Freitas et al., 2022; Veloso et al., 2019). The most observed flavors are chocolate, *cajeta*, passion fruit, sugar, anise, carrot, coconut and *even chili*, the latter being one of the best sellers in the entire northern region of Mexico.

*Fiesta pasteles* (figure 8) or party cakes are generally very similar to the American style of making fillings, based on butter cream (butter and sugar) and chocolate. The curious fact in Mexican cakes is that these cakes are usually bitter, usually by the use of bitter chocolate, but do not take *chili*. However, it is wrong who believes that mexicans would eat the *cake without chili*: the slice of cake is served along with a sachet of chili powder and a slice of lemon. This gustatory sensation of acid, bitter, sweet and spicy, activates sensory receptors leading to increased perception of flavors and increased salivation (Reyes, 2013), sensations widely appreciated in Mexican cuisine (Ayora-Diaz, 2022).
Very traditional of southern Mexico, marquesita is a typical street sweet (Figure 10) that usually pleases all audiences, from children to the elderly. The dough is made from sugar, cornflour, honey and water and is very similar to the cavaquinho (traditional sweet Pernambuco in the form of presentation) and with the chinese lucky biscoitinho, being essentially a tuille of corn instead of wheat flour, as in French cuisine.

As shown in Figure 10, the equipment for making marquesita consists of a cart with a metal press heated by a stove. With the press open, the dough is poured, closed, stuffed, folded and finished. The fillings are diverse and can be cajeta, coconut, Edam cheese, hazelnut cream with banana, among others. Another interesting factor is that the preparation comes out of the plate very soft and after 20 seconds becomes super crispy.

One of the most traditional street sweets in central Mexico are the buñuelos (Figure 11), which consist of a sugar-based dough and cornflour, fried in a traditional format. Much consumed in the Mexican
streets, it is one of the simplest and quickest sweets to make, it is very similar to the sweet Pernambuco called a dream of form or children, the difference is the type of flour, which for Mexicans could not be different, but that of corn.

Figure 10. *Buñuelos frying process.*

Source: Autores (2020).

4 CONCLUSION

Sweetness is perceived in various ways within each food culture in the world. Mexican sweets have their traditions and flavor profile very different from the Brazilian and the rest of the world, but this finding does not make them bad, it makes them unique. Although sugar is present in most sweets, the perceived sweetness in the palate is something that is outside the rule in Mexico, since the sour, the bitter, and especially the spicy gain prominence. Considering the peculiarity of each kitchen, more comprehensive and in-depth research would be of great contribution to ratifying and consolidating the various existing food cultures, especially at a time of globalization and standardization of flavors and making in world gastronomy.

ABSTRACT
Considering the importance of equine culture for the northeast region, the objective was to determine the median artery Doppler velocimetry measurements in horses through Doppler ultrasonography and to correlate changes in these measurements with possible risk factors for laminitis and/or other foot diseases. The project was approved for its execution through protocol No. 3769100419 granted by the UFPB Ethics Committee. The analyses were performed at Horse Training Centers and at the Veterinary Hospital - CCA / UFPB, in Areia, Paraíba State. Fourteen animals were used, which were trichotomized at the time of the third metacarpal bone, medial face of both thoracic limbs. The sonoscope S2V ultrasound device with color Doppler coupled to a 7 MHz linear probe was placed at the height of the median artery, in which B was measured. Then, the color Doppler mode was used to determine the doppler velocimeter measurements. Thus, with a 95% confidence interval in mode B 0,509 ± 0,133 of the median artery diameter was determined and in Doppler mode 2,198 ± 1,451 of the pulsatility index and 0,734 ± 0,906 of the resistivity index (non-parametric data), as reference values for normality of median artery vascularization. It is concluded that more studies need to be developed to attest to the reliability of these values. Moreover, they may help in the early diagnosis, improving the prognosis of these animals prone to laminitis and other foot diseases.

Keywords: Doppler. Equine. Ultrasound.

1 INTRODUCTION

The locomotor system of equines has an important role in biomechanics and sustentation of these animals because of its weight and impact of the limbs on the ground. Laminitis is the main and most serious disease that affects the equine hooves and may keep the animals away from their sportive life, or even imply in euthanasia.

Several studies constantly present research on the causes, physiopathology, and treatment of laminitis; however, there are divergences in certain aspects. The most accepted theory, currently, is that laminitis is caused by peripheral vasoconstriction resulting from adverse systemic factors of animal metabolism, with release of endotoxins, chemical mediators that determine, for instance, hypoxia and necrosis of the dermal and epidermal laminae of the hoof and, consequently, rotation of the distal phalange (11,12). After this rotation, there is damage to adjacent structures, such as the solar corium, the local blood...
Principles and Concepts for development in nowadays society - Determination of Doppler velocimetric measurements of the median artery in horses

system, and the hoof coronary band. The resulting pain is intense and is followed by claudication, which is characteristic of the clinical picture (9).

Doppler ultrasonography is a noninvasive and low-cost method of relatively recent application in veterinary medicine. It is believed that it can satisfactorily assist in obtaining normal parameters and consequently in the detection of foot disorders due to the high specificity and sensitivity of the method (14).

The Doppler technique provides qualitative and quantitative data in real time on vascular identity, presence, direction, velocity, characterization of vascular patterns and the type of blood flow. It also makes it possible to document disease-associated flow disturbances and to acquire information regarding the vascular perfusion of various vital organs through the velocity spectrum characteristic of each vascular structure. It determines the architecture (dimensions and contours) and hemodynamic aspects of the major peripheral and central blood vessels (6).

The physical principle of Doppler mode ultrasound is based on the Doppler effect, which describes the change in the wave frequency of sound that occurs when there is relative motion between the emitting source and the receiver (8). In contrast to two-dimensional gray-scale ultrasound, which displays information of tissue interfaces, Doppler ultrasound instruments are optimized to display flow information. It thus allows the assessment of hemodynamics by analyzing the emitted sound, velocity spectral waves, and color mapping (7,13).

The color representation is independent of whether the vessel conducts arterial or venous blood (1). The concomitant presentation of the conventional B-mode image (of the assessed organ region or vessel region) and the Doppler spectral tracing constitute the duplex system.

Considering the importance of the vascularization of the digit in the occurrence of foot diseases such as laminitis and the socio-economic importance of these animals in the agricultural and cattle raising scenario, the goal is to increasingly minimize losses due to lesions that compromise the performance of horses. Therefore, the evaluation of the equine vascular system by duplex Doppler ultrasonography has been used to describe pathological hemodynamic incidences of the equine muscular blood flow and digital blood flow in horses affected by podochondrosis and laminitis (10), helping in the early diagnosis and in the improvement of the prognosis of such patients. Therefore, the present study aims to determine the Doppler velocimetric measurements of the median artery in horses by means of Doppler ultrasonography and correlate changes in these measurements with possible risk factors for laminitis and/or other podal diseases.

2 MATERIALS AND METHODS

The research took place at Horse Training Centers and at the Veterinary Hospital - CCA/UFPB, in Areia, Paraíba state. We used 14 horses of both sexes (11 females and 3 males), with ages ranging from 6 to 15 years old. The project was approved by the UFPB Ethics Committee under protocol number 3769100419.
For the ultrasound study, the animals did not need to be sedated, only restrained with the use of a halter, and were also trichotomized in the palmaromedial region of the third metacarpal bone in both thoracic limbs. We used only one operator and a single Sonoscape S2V ultrasound device coupled to a 7 MHz linear probe with ultrasound gel, and in B mode the first image of the median artery was taken with the position of the transducer in longitudinal section, aiming to obtain its location and measurement.

The measurement of the arterial diameter was performed from a curled image in longitudinal section followed by a manual tracing extending from the external part of the wall to the internal part of the other vascular extremity. In the same two-dimensional image, new measurements were performed in two other distinct points of the vessel, obtaining a mean diameter between the three measurements to calculate the mean flow. (Figure 1).

Subsequently, the color Doppler mode or color flow mapping was activated, in which the frequency shift is shown as a spectrum of one or two colors within an area defined as a color box. In longitudinal section, the cursor was manually positioned in the central region of the vessel to capture the region of highest flow velocity, forming a 60-degree angle between the long axis of the vessel and the transducer sound beam. Automatic measurements of the Sonoscape software model S2V were performed with a cursor positioned at the peak of a spectral wave and a second cursor at the beginning of the next peak to obtain the pulsatility and resistivity index parameters (PI and RI). (Figure 2).

After determining the Doppler velocimetric measurements, the results were submitted to descriptive analysis to obtain the mean, median and standard deviation. Then the Kolmogorov-Smirnov normality test was applied to verify the normal distribution of results found between groups. For all analyses, a significance level of 5% was adopted \(^{(14)}\). The data were analyzed in SPSS (version 25). Initially, the trend of data distribution was checked to decide which would be the most representative form.

### 3 RESULTS AND DISCUSSION

The Kolmogorov-Smirnov test indicated that the RI has a high probability of not having a parametric distribution \((p < 0.001, \text{ Asymmetry } = -0.492 \text{ and kurtosis } = -1.625)\). Thus, considering that there are data that can be non-parametric, the median was adopted in addition to the mean and standard deviation. In addition, we also estimated the 95% confidence interval, which is presented numerically.

The ultrasonographic evaluations of the median artery in adult horses are shown in table 2. In the B mode, the mean and standard deviation of the median artery diameter was 0.509 ± 0.133, with the 95% confidence interval ranging from 0.457 to 0.561. In the Doppler mode, the PI presented a mean and standard deviation of 2.198 ± 1.451, with the 95% confidence interval ranging from 1.637 to 2.762. The RI was the only measure that showed no evidence of normal distribution, so we chose to describe the median that showed a value of 0.980.

The vascularization of the equine forelimbs extremities is done through the median artery that originates the medial palmar artery, also described as common palmar digital artery \(^{(2)}\). This artery in turn
Principles and Concepts for development in nowadays society - Determination of Doppler velocimetric measurements of the median artery in horses

originates in the lateral and medial portions of the limb, tangent to the metacarpophalangeal joint and the digital palmar artery, lateral and medial respectively, distal to the sesamoid bones (2). In this case, animals without foot affections, adults, and non-athletes were chosen to measure the Doppler velocity parameters of the median artery since it originates the smaller arteries, besides being easier to locate and measure because it has a large caliber.

Vieira (2016) compared two groups of animals, among them athletes in a resting period and foals never submitted to endurance races or any physical activity. Thus, he observed that the constant permanence of hemodynamic parameters in both groups demonstrates the non-relationship between the history of physical activity with possible sonographic alterations of the lateral palmar digital artery. Furthermore, he noted similarity between the parameters of both groups. Unlike the age and activity range reported above, we chose to work with non-athletic adult animals, due to the ease and habit of manipulating the limbs, thus avoiding physiological changes caused by stress.

Wongamnuaykul et al. (2006) compared Doppler data between animals with laminitis and septic pododermatitis with a control group and observed that the PI was significantly lower in animals affected by the disease, due to reduced vascularization. Thus, we chose healthy animals for the study to avoid significant differences in Doppler parameters as reported by Wongamnuaykul et al 2006. It is worth noting that the authors state that they have no knowledge of using Doppler ultrasound in digital arteries with animals with spontaneously occurring or induced laminitis and septic pododermatitis.

The PI and RI values reported by Wongamnuaykul et al. (2006) of the palmar digital artery in control horses were 1.93 ± 0.227 and 0.69 ± 0.022, respectively. In our study the values were PI 2.198 ± 1.451 and RI 0.980 (median).

Probably the discrepancy in data is due to the vessel chosen for measurement since the median artery has a large caliber and consequently has a greater pulsatility compared to the palmar digital artery.

The endothelium of the vessels is influenced by the sympathetic stimulation to which they were subjected. Therefore, the diameter of the peripheral arteries of horses sedated by acepromazine was described by Hoffman et al. (1999) with a subjective increase, while the diameter was shown to be smaller when xylazine was applied. Otherwise, Finding et al. (2012) considered that arterial vasodilation in horses was much more subject to the interferences of the cardiac cycle than to the role imposed by the sympathetic component of the autonomic nervous system. Therefore, it was decided not to use anesthetics to avoid interference of vasoactive effects caused by sedatives on the diameter of the artery, since it was possible to perform the ultrasonographic study with only the halter and lunge restraint to determine the feasibility and usefulness of the method.

To obtain quality Doppler ultrasound images, it is necessary that the operator be familiar with the technique and be able to properly adjust and explore the functions of the equipment (2). The most used indices are the resistance index and the pulsatility index. These parameters are more widely used than
absolute velocity measurements because they are independent of the insonation angle and less subject to error. Changes in these indices can aid in identifying changes in vascular resistance (1).

Vieira (2016) reports that the coefficient of variance of blood flow and the index of lateral variation of the digital artery lower velocity in animals move less velocity during blood flow move less velocity of lateral flow if move less velocity of lateral flow they move less speed of the flow of moving animals. The remaining uses of a temperature-controlled environment to carry out inspections can considerably conform to significant flow parameters. In our study, there was no significant difference in the values of the resistivity index between the calmer and more agitated animals.

The relationship of feeding, limb positioning, body weight and foot disorders on the hemodynamic aspects of the blood flow of the palmar digital arteries, such as the pulsatility and resistivity index, flow velocity and vessel diameter, using ultrasound Doppler in horses have been investigated (4). The same is true for the case of the treatment media, as it is based on recent studies in veterinary medicine.

4 CONCLUSION

It is concluded that the reference values for normality of median artery vascularization determined with a confidence interval of 95% were in B-mode 0.509 ± 0.133 for the median artery diameter and in the Doppler mode 2.198 ± 1.451 for the pulsatility index and 0.734 ± 0.734 ± 0.906 of the resistivity index (non-parametric data). However, more studies need to be developed to attest to the reliability of these values, in addition, they can help in the early diagnosis, improving the prognosis of these animals prone to laminitis and other foot diseases. Although Doppler ultrasound is considered a complementary method in veterinary medicine, it should be used in association with two-dimensional images, other complementary exams and the clinical signs presented by the patient.

ABSTRACT
The presence of a nurse in school environments brings continuous improvements in health education processes, provides a better quality in child health care, as well as a sense of security for other professionals working in these units. However, even with the enactment of Law No. 1,616 of 2011, which requires the presence of the professional nurse in school environments, the performance of this professional in this environment is scarce. To investigate the presence of nurses in public schools and day care centers in the rural area of Imperatriz - MA. Documentary, descriptive research with a quantitative approach carried out in the rural area of the municipality of Imperatriz - MA. For data collection. A consultation was carried out at the Municipal Secretary of Education (SEMED) of the municipality of Imperatriz. Collection of information related to the total number of municipal schools and day care centers, address, area, village, number of students and the presence of the professional nurse at the school or day care center. The municipality of Imperatriz has 127 municipal school units. Of these 100 are located in urban areas and 27 in rural areas. The school units in the rural area include a total of 2646 students. It was observed that no school unit has the presence of a nursing professional in the school. It brings a reflection on the importance of the role of the nurse professional in these spaces.

Key-words: School nurse; Health promotion; Schools and kindergartens.

1 INTRODUCTION
The school environment should be understood as a space of relationships that promote critical and political development, contributing to the construction of personal values, beliefs, concepts, and ways of knowing the world. Thus, it directly interferes in the social evolution and in the maintenance of the learner's health (Bastos et al., 2021).

The nurse is of paramount importance for the preservation of health and protection of children in the school environment. Thus, their contribution and influence is directly related to the prevention of worsening the damage that can affect children and adolescents who often run, play and perform movements that are prone to accidents in the school environment. From this assumption, there is a concern generated by the absence of a nurse in the school environment, to act in cases of occurrences related to accidents (Mourão et al., 2021).

Nursing is a profession that has as its essence the care of the human being, individually, in the family or in the community. Given the qualifications of this professional and the situations that are recurrent
in educational institutions, the presence of this professional in such environments is essential, strengthening the structure of the team of professionals, providing assistance to students and other members of the institution in cases of accidents (Salazar, 2011).

According to Silva et al. (2017), although most school accidents do not require medical care, there is a significant rate of accidents, with more than one third due to sports and recreational activities and almost one third due to falls during other activities. In this way, we realize the need for the presence of nurses to minimize the consequences that can be generated by accidents, providing first aid and ensuring the welfare of the child. another significant contribution that nurses can bring to the school environment is related to practices of prevention and awareness. Thus, nurses can direct the attention of students and professionals of the institution to practices that minimize the occurrence of incidents (Costa et al. , 2013).

Thus, it is important to emphasize that health education should work on several factors that contribute to the generation of new preventive habits. This health education work is the responsibility of the professional nurse and must be performed actively and continuously within the school environment. It is understood that the objectives of education directed to health is to develop in people the sense of responsibility for their own health and for the health of the community (Oliveira; Gonçalves, 2004).

It becomes clear the need to create a protection system within daycare centers and schools, where the same will develop educational projects that train the entire multidisciplinary team working in the education network of these daycare centers and schools. However, even with the institution of law No. 1616 of 2011, which presents the mandatory presence of the nursing professional in school and daycare centers, it is noted the deficiency in compliance with it, and the performance of this professional in school environments is scarce (Brazil, 2011).

In the 1980s, Imperatriz became the second most populous city in the state of Maranhão. According to Lima (2005), most of the neighborhoods were formed by rural workers and their families, these in turn are more characterized as villages, which still have several rural characteristics, but with a city dynamic. The move of these rural workers to the city did not mean, at least in part, a change in their skills, their social relations, their way of life. That is, while they live in the city, they continue with the activities and lifestyles they brought from their rural experience. Due to this new scenario, it became necessary to investigate which schools and daycare centers in the rural area of the municipality of Imperatriz - MA have an active nursing professional.

Therefore, the objective of this research was to investigate the presence of nurses in public schools and daycare centers in the rural area of Imperatriz -MA, because this professional is of total relevance to the construction of health and safety actions for children and adolescents, being able to elaborate, along with the other professionals working in this environment, strategies and methods that provide this educational site with a safe space, since it is located in a place characterized as difficult to access.
2 METHODOLOGY

This is a descriptive documentary research with a quantitative approach carried out in the city of Imperatriz - MA (5°31’32" S and 47°26’35" W), located in the Metropolitan Region of Southwest Maranhão, has Amazon rainforest vegetation and cerrado with a sub-humid tropical climate. According to the census conducted by IBGE (Brazilian Institute of Geography and Statistics) in 2010, the population was 247,505 inhabitants, the municipality is ranked as the second most populous in Maranhão (IBGE, 2020).

The study was conducted in rural areas, villages characterized by difficult access, which further strengthens the need for professional nurses in schools and daycare centers in these locations, highlighting the accessibility.

Data collection occurred in April 2022. For data collection, a consultation was conducted with the Municipal Secretary of Education (SEMED) of the municipality of Imperatriz - MA. Information was collected on the total number of municipal schools and daycare centers, address, zone, town, number of students, and the presence of a nurse professional in the school or daycare center.

Among the inclusion criteria were all educational units (schools and day care centers), which are located in the rural area of the municipality of Imperatriz - MA. The exclusion criteria were all school units (schools and daycare centers) that did not belong to the public network and were not located in the rural area of the municipality of Imperatriz - MA, as shown in figure 1.
3 RESULTS AND DISCUSSION

The municipality of Imperatriz has 127 municipal schools and daycare centers. Of these, 100 are located in urban areas and 27 in rural areas. Here it is important to note that schools located in rural areas may have difficulties in rapid access to hospitals or Basic Health Units (UBS). This makes it even more important to comply with Law No. 1,616 of 2011.

A very important piece of data that was collected refers to the age and number of students present in the 27 units that were part of the study. The school units in the rural area include a total of 2646 students aged 0 to 14 years. Taking into account studies that have already been conducted, such as that of Moura et al. (2021), it becomes noticeable that students often have accidents during activities that involve playing and physical movements. Thus, the author highlights several injuries that can worsen if not attended immediately by a qualified professional.

Moura et al. (2021), points out injuries to the head, face and limbs, being directly linked to falls, cuts and fractures. A study conducted in France with the participation of 2396 children and adolescents who suffered accidents at school and were treated in the school infirmary, resulted in 52.8% of the injuries occurring during the practice of sports activities and 12.7% during the practice of recreational activities. The sum of the results gave the observation that, according to the information from the injured students, carelessness with oneself was the result of 26% of the accidents and the lack of stability by 17.5%. Hospitalizations are necessary in 2.7% of the occurrences, absence from school without hospitalization occurred in 11.4% of the cases.

As previously mentioned, the 27 educational institutions in the rural area of Imperatriz - MA, have the presence of 2646 students, however, one cannot fail to highlight the presence of 537 service providers who work in these institutions, data that were collected in the Municipal Secretariat of Imperatriz (SEMED). These professionals need to perform their activities in a safe place, and just like the students, they can benefit from the presence of a professional nurse in the institution where they work.

The nurse has an indispensable role within the school and daycare centers space, available and resolutive within their work demand, by developing strategies in care, always offering the best service, welcoming the student in a humanized way, contributing and participating in the planning of care actions, since they observe and evaluate each student daily (Salazar, 2011).

Silva et al. (2017), states that the school environment is a place where there are possibilities of occurrences of accidents and situations that require the presence of a professional with qualifications in first aid care such as the professional nurse.

Of the 27 municipal school units in the rural area, 96.30% (26/27) are schools and 3.7% (1/27) are municipal daycare centers. Thus, the results about the educational institution, address, number of students and the number of nursing professionals working in schools and daycare centers are presented in table 01.
Table 01 - Number of municipal schools and daycare centers in the rural area in the city of Imperatriz - MA, by April 2022.

</table>
According to the data collected in this research, it was observed that there is no presence of a nurse in any of the 27 educational institutions. This data generates a concern about the safety of the 2646 students who are present daily in these educational institutions in the rural area of the city of Imperatriz - MA. Since the presence of nurses in daycare centers and schools is extremely important for the safety of students. Corroborating with Rodrigues and Rodrigues (2016), who emphasized that the presence of nurses is of utmost importance, being able to provide guidance on the safety of the school space, informing about possible risks, which are objectively environmental, social and psychological, this should be constantly assessed, being a concern of those responsible, teachers and school management. The school environment is characterized as an important scenario for the occurrence of accidents that require techniques. When it comes to children, it is known that they spend much of their day inside the school unit, thus bringing to this space the high rate of accidents, with children aged 0 to 12 years, the consequences of these consecutive traumas may have different degrees, and may be mild, without the need for intervention, until they lead to death.

Although there are risks of accidents and traumas in the school environment, children cannot be prevented from participating in recreational moments due to the dangers existing in the place. Recreational activities are part of childhood and it is natural for the student that such activities occur in the school
environment. It becomes necessary the presence and creation of a protection system for children in this age group, aiming that the first assistances are made by the nursing professional, immediately and effectively, knowing that these professionals have specific preparation that enables them to perform such procedures.

Nurses are essential in school education because they have the technical and theoretical capacity to address aspects that can promote and prevent health within the school environment, spreading in a playful way and with specific language, avoiding possible accidents, and if they happen to affect children, they will be prepared to attend to them efficiently (Casemiro et al., 2014).

Thus, it is characterized as an effective strategy that is put into practice the Law No. 1616 of 2011, which provides for the requirement of nursing professionals in schools and daycare centers. Corroborating with the aforementioned actors, it is clear that the nursing professional plays a key role in health promotion, giving lectures on sexual orientation, prevention of parasitic and infectious diseases within the school space, thus being a determining factor (Rasche, 2008). According to the Law that provides for the professional practice, Law No. 7.498, of June 25, 1986, article 11, item II, letter j, determines that it is the exclusive role of nurses to provide education aimed at improving the health condition of the population (Planalto, 1986).

The school is an important vehicle in the promotion and protection of health for minors, it becomes indispensable to engage them in solutions to emergency conditions. Thus, those involved will prevent and remedy risk situations, disseminating such means in their respective school communities. Knowing this, the evaluation of a school that promotes health, comes to reaffirm the assumptions with respect to the development of the research addressed (Soares, 2011; Tinocoet et al., 2014).

Educational health promotion within the school environment is a long and continuous process of development. This process must be able to contribute to the acquisition of skills in children, allowing them to confront themselves positively, build a life project and be able to make individual, conscious and responsible choices. The promotion of health education at school also has the mission of creating environments that facilitate these choices and stimulate a critical spirit for the exercise of citizenship (Maciel et al., 2010).

The adherence to the Health Education program in schools and daycare centers does not occur effectively and homogeneously, unfortunately. Even though it is a program of comprehensive care to school health, and that should come into force within the principle of equity, it is made visible by the adhesion of the municipalities. This observation contradicts what the specialists say when they state that the inclusion of health professionals, the nursing professional, in the school day-to-day routine brings benefits in the medium and long term (Ministério da Saúde, 2007).

In this way, it is very important to train the other employees in basic health support, so that if necessary, everyone can provide the necessary care, waiting for a trained professional (nurse) to continue the care.

The educational units in rural areas are characterized as difficult to access, which strengthens the need for a team ready to serve the children of the school units, if necessary. The location of schools and
daycare centers in rural areas strengthens the need for an active professional nurse, because they are far from Emergency and Urgent Care Units and Hospitals, a relevant aspect when considering that the care for occurrences must be done immediately, thus avoiding further damage to the victim.

Several schools in rural areas are characterized as being harmful to health, for not having basic sanitation and being located in areas of difficult access, often the children being threatened by social morbidities, where we can include sexual abuse, violence, mistreatment, accidents and drugs, thus children and adolescents end up developing inappropriate practices for their health. In addition, many young people end up being exposed to infectious and parasitic diseases and risky health practices, for these reasons it is clear that health promotion and prevention is of great importance (Baraldi, 2018).

Given this, the Pan American Health Organization (PAHO), at the Regional Workshop of the World Health Organization, has an intersectoral priority on health promotion at school, since in addition to finding children and adolescents in the growth and development phase, it is also a place where most health education programs have been taken, not only for students, but even for family members and teachers, thus creating an interaction between them. Although health promotion activities have been carried out for a long time, they still have a strong focus on disease prevention and control, but it is necessary to emphasize that health promotion also addresses aspects for healthy attitudes, mental and psychosocial health development, and more effective practices (Ministério da Saúde, 2007).

In a study by Baggio et al. (2017), it is possible to understand the process of implementation of nurses in community schools in Cascavel - PR, the study followed the implementation of 15 nurses in community schools, between April and August 2015. In the article, Baggio states that to begin activities and implementation measures in the community, the municipal intersectoral working group offered moments of meetings, which some participants called "training", others called "meetings" or "informations". These meetings aimed to provide information or guidance about the activities to be developed in the implementation. These meetings were attended by health professionals who discussed implementation strategies and which methods would be used.

In some reports, participants reported that education professionals were receptive to health professionals and that after the implementation of the health team in the school, the collaboration of education professionals enabled the process of health assessment of students, which achieved a positive result. It was possible to conclude, that there was a participatory and collaborative interaction between health and education professionals during the period (Baggio et al., 2017).

5 CONCLUSION

The presence of nursing professionals in schools is of utmost importance for the safety and well-being of the children who study and attend these educational institutions in the rural area of Imperatriz - MA.
The school environment is prone to accidents, because it has a large number of children who are practicing activities of running, jumping, and at the same time counting on the distractions that can occur during this social interaction. In this way, the conditions for incidents to occur begin to emerge.

However, from the survey and analysis of data collected in schools and daycare centers in the rural area of the city of Imperatriz - MA, it was possible to observe that these institutions do not have the presence of a professional nurse. Thus, we conclude that the nurse's role provides security, avoiding the aggravation of several occurrences that can affect these students. However, the lack of nursing professionals generates an unsafe environment that is prone to accidents and aggravation of the consequences of these accidents due to the lack of a nursing professional to provide first aid.

Therefore, further research is needed to expose a problem that can often go unnoticed, since the presence of nurses is of paramount importance for the safety and well-being of students in the municipal school network in the rural area of Imperatriz - MA.

ABSTRACT

The paper addresses the biopolitical and subjective implications of the medicalization and pathologization of vital processes. These phenomena are included in the articulation of bio-political technologies of the government of the bodies and non-political technologies of the government of the signs, attending to the subjective effects they produce. The body, health, and life are conceived in a complex perspective that considers both the corporeal materialities that manifest symptoms and discomforts and the discourses, imaginaries, and subjective constructions that cross them. The article assumes the dual purpose of consolidating a theoretical approach in the philosophical, sociological, and semantic key of these phenomena, and at the same time providing an empirical analysis of how the discourses of medicalization are structured and circulate socially. A discursive perspective is assumed that emphasizes the significant construction of health care as a central problem that crosses the fields of Communication and Health and studies on life governments. An analysis of advertising speeches of pharmaceutical and dermo-cosmetic laboratories is developed, referring to vital processes such as pregnancy, childbirth, and aging, considered among the main "non-diseases" medicalized. The analysis allows us to illuminate significant operations related to health, well-being, body, life, discomfort, pain, and disease about the vital processes object of the inquiry.

Keywords: Medicalization, Pathologization, Government of life, Subjectivity, Social discourses.

1 INTRODUCTION

The problematization of the contemporary processes of medicalization undertaken in this work has the double purpose of consolidating a theoretical, philosophical, sociological, and semantic approach to these phenomena, on the one hand and providing empirical evidence on how the discursivity of the medicalization of bodies and the subjective effects it generates is structured and socially circulated on the other.

The theoretical-conceptual framework of the article is multiple. The medicalization and construction of diseases are approached in terms of governmentality, including in the articulation of biopolitical technologies and subjectivation (Foucault, 1996a, 1996b, 1996c, 2010) and a noo-politics oriented to the government of signs (Lazzarato, 2006). A communicational and discursive perspective is adopted that brings to the fore the significant construction of health care as a central problem of the field of Communication and Health (Rodríguez Zoya, 2017); considering particularly the effects of subjectivation of media discourses (Silva and Navarro, 2020), such as advertising. In addition, the development of the topics covered in this article echoes the notion of complex problems as the cornerstone of any problematization exercise (Rodríguez Zoya and Rodríguez Zoya, 2019).
The theoretical premise that supports the work maintains that the problematization of medicalization requires conceiving the body, health, and life as complex entities, woven by meanings and discourses that condense into imaginaries and social ethos; subjective positions tensed by beliefs, desires, demands, concerns, discomforts and ideals of health and well-being; as well as by the materiality of the bodies themselves in which symptoms and well-being manifest and discomforts, and become recipients of products aimed at sanitizing them, assisting them, calming them, healing, regulating them and controlling them.

The objective of the work is to identify and understand the meanings associated with the body and health, as well as the effects of subjectivation generated by the discursivity of medicalization. To this end, an empirical investigation of the mechanisms of pathologization or invention of diseases conveyed by advertising speeches of pharmaceutical and dermo-cosmetic laboratories is carried out, paying particular attention to the significant construction of discomforts associated with normal life processes.

Discourse analysis is carried out from a corpus of advertising spots for over-the-counter products aimed at body care and health, broadcast in audiovisual format on open television and cable in Argentina. The results of the analysis gather interpretations of the significant operations present in advertising discourses around three main vital processes that are crossed by medicalization and the construction of diseases and discomforts: pregnancy, childbirth, and aging.

The structure of article is organized as follows. First, the theoretical foundations of biopolitics as a technology of power and its relationship with medicalization are presented (section 2). Theoretical reflections on the categories of body and life and the effects of subjectivation constituted in a significant mesh of social discourses are continued (section 3). Then, the particularities of pathologization processes through the invention or objectification of new diseases, the centrality of the pharmaceutical-biomedical-technological complex, and the link between economic logic and social ethos are addressed (section 4). Additionally, the analysis of advertising discourses of pharmaceutical and dermo-cosmetic products is developed which gives empirical support to this work (section 5). The methodological aspects and the analytical treatment of the discourses on Pregnancy, Childbirth, and Aging are presented (sections 5.1, 5.2, 5.3, and 5.4, respectively). As a discussion and final reflections (section 6), the main observations made at the theoretical level and emerging from the analysis process are systematized.

2 BIOPOLITICAL CONTROL AND MEDICALIZATION OF LIFE

Biopolitics, medicalization, and the invention of diseases are three central notions for this work, but it is not in isolation that they are interesting but from the understanding of their close link. The notion of biopolitics refers to the power that acts on life, not at the level of the individual body but in the direction of the human species. It is, in effect, a type of technology of power that works with the population as a biological problem and as a problem of government, a power of regulation that makes life and let's die (Foucault, 1996c, 1977). The difference between technologies of power pointed out by Michel Foucault makes it possible to distinguish within the eighteenth century a change of governmental practice and reason

Principles and Concepts for development in nowadays society - Medicalization and governance of vital processes: Biopolitical and subjective implications in a discursive key

1840
from an anatomopolitics of the individual human body to a biopolitics of the human species. In his words: "After a seizure of power over the body that was carried out according to individuation, we have a second seizure of power that proceeds in the direction of massification" (Foucault, 1996c:196). The reference to the power to make life and let die corresponds to the exercise of power over life, while the right of life and death in sovereign power was exercised in the opposite direction: to make die or let live. Both anatomopolitics (disciplines of the body) and biopolitics (population regulations) refer to the organization of power over life, with the objectives of biopower aimed at the regulation of births, deaths, fertility and reproduction rates, health, hygiene, longevity, etc.

A thin line is drawn between power and life. Both spheres usurp each other in a movement where power penetrates the body – whether individual or collective – through the nervation of life; And life, through the body, becomes the object of power. It could be said that, for power, the body is an excuse, while for life, a necessity. What happens when that need is put into tension and the body becomes only a possibility for the category of life? This question, formulated rhetorically, connects with the implications that condense the notions of "interchangeable bodies" (Virilio, 1999) and "human material", which entail a "new political economy of life" (Iacub, 2004).

For its part, the concept of medicalization refers to the processes by which modern medicine – its practices, its discourse, and its technological apparatus – extends to a growing number of social spheres and takes as legitimate objects of medical intervention different types of problems that were not previously considered as such (Foucault, 1996a; Illich, 1975). In this way, medicine ceases to have a field outside itself and due to the expansion of its sphere of action, everything in society becomes medicalizable (Foucault, 1996a). According to Rodríguez Díaz (2008:74), "medicalization means that much of our behavior can be subject to medical controls. So are the different cycles of life, so are the little annoyances and anxieties, so are what were once sins and many crimes."

Medicalization constitutes a biopolitical strategy insofar as it constitutes a population control device with political and economic importance (Foucault, 1996a, 1996b). The social actors involved in the production and circulation of the medicalization discourse are diverse: from private sector industries, the State, the media, the medical institution linked to the pharmaceutical industry, to sectors of the population in a double role as consumers-users of health products and services, and as a source of demands for improved health (Conrad, 2007; Márquez and Meneu, 2003).

Within the framework of medicalization processes and advances in genetics, neurosciences, and biotechnology, the definitions of body and life are modified; Therefore, the mechanisms that biopolitics as life management and regulation of man-species biological processes bring into play are also transformed. Following the line of articulation between power and life, Foucault (1996a) analyzes the link between medicine, power, economy, and society. In this sense, he affirms that medicine is part of a historical system related to an economic and power system, while the preponderance granted to pathology becomes a form of regulation of society. Also, Esposito (2005: 172) recognizes that the crossing point between political
knowledge and medical knowledge is constituted by the problem of the conservation of the body and warns: "it is from the perspective opened by the disease that this conservation acquires a central importance".

3 BODY, LIFE, AND SUBJECTIVATION

The category of life is central to the technology of biopolitical power that seeks regulatory bodies in their collective character of species and population. At this time there will be some reflections on the notions of life and body in the framework of medicalization processes, and on how these are inscribed in – and constitute – a biopolitical strategy that also generates subjectivation effects.¹

Biopower technology postulates human life as a political category and directs its action toward the problem of its protection. Faced with this principle, Esposito (2005: 28) observes that "life can only be protected from what denies it through further negation". However, in the face of that assertion, it is pertinent to ask a twofold question. First, what is it that denies life? Quickly, it could be said that the denial of life can be expressed as non-life, but the mode it assumes is complex. This can be found either in death or in a bare life is one that is on the margins of life itself, which is included in it in terms of exclusion, a life "that does not deserve to be lived" (Agamben, 1998). Esposito (2005:26) himself would answer that "disease – and death – is the shadow cone within which the science of life is cut". Following the dialectical movement present in Esposito's observation, the second question is oriented to consider: what are we denying to deny, avoid, suspend, or protect ourselves from death? Thinking of an answer invites me to believe that what we deny is the transit that leads us to what we want to deny. We deny its imminence and the certainty that something always escapes. We deny not being able to control it and wish we could. But desire is also found in the realm of what escapes, and we escape behind.

A way, although vain, to achieve that desire is to identify, name and move away from that something that prevents achieving it and becomes a sign of our condition of imperfection and expiration. The objectification of the unwanted or the different – two ways of designating an alterity that becomes threatening – in many cases borders on the extreme; Especially when we notice that the place of that other is occupied by symptoms or discomforts that in the discourse of medicalization is constructed as diseases, such as hyperactivity in children, premenstrual syndrome in women, baldness in men, depression in the unhappy and unhappiness in most of us.

The denial/exclusion of what threatens us, makes us sick, ages, and/or removes us from the regular or ideal, is present in any immune procedure that seeks to reduce what inhibits the development of life; that is, it takes care of protecting it. Already in the Middle Ages, exclusion was part of one of the paradigmatic medical-political systems. The emergency plan applied against leprosy was a model of exclusion and exile for the purification of the city: "Medicalizing an individual meant separating him and, in this way, purifying others. It was a medicine of exclusion" (Foucault, 1996b: 95). The hospitalization of the patient in the

¹ I use the term subjectivation to accentuate the procedural nature of the subjectivity, instead of talking about the Constitution of subjectivities as something finished.
hospital and the confinement of the madman in the asylum institute a physical-spatial limit that marks a symbolic difference: the outside corresponds to the space of non-disease.

From this, what is interesting is to question how to exclude the threat that invades us when it is part of our own body. The fact of being diagnosed, giving the evil a name, and, thus, ensuring the existence of a treatment that distances it, gives us peace of mind. "It is essential that abroad there is something of an intruder because without it loses its alienation," says Jean-Luc Nancy (2007: 11) regarding implants. One might think the same of viruses, wrinkles, new – and already old – "extra pounds" whose property title nobody wants to sign, and for everything that stands in the way of the search for "perfect health" (Sfez, 2008). In short, everything that happens to us happens to us (being) in our bodies.

The body corresponds to a political field where a new political economy of life is also inscribed (Iacub, 2004), in which pain regains prominence, but no longer as a spectacle in the public square or as a constitutive element of punishment, but in the most interior of the body as a target to be denied to protect, prolong and produce life. The body is our territory and the map we have of it never comes to represent it in finished form. "The body, far from constituting a definitive and unchangeable data, is an operative construct open to a continuous circumstantial exchange" (Esposito, 2005: 30). This opening to the middle occurs as if after the cutting and knotting of the first umbilical cord others had been unleashed that continue to nourish and affect us. In the immersion of the body in its midst, there is no passivity on the part of the first nor domination on the part of the second, there is a dialectical interaction between both. In this communication there is no neutrality: the encounter of bodies – including those of others and the inanimate – and meanings – always social – produces effects of subjectivation.

The significant mesh that traps and cushions us is woven by innumerable and heterogeneous discourses, among which it is possible to isolate that of medicalization. I dare to propose that in the discourse of medicalization two technologies of power converge: biopolitics and non-politics (Lazzarato, 2006): government of bodies and the government of signs are closely intertwined. At the intersection of both technologies, medicalization processes articulate a set of meanings, imaginaries, and practices around life, the body, health care, well-being, vitality, etc., constituting an ethos and modeling subjectivation effects (Rodríguez Zoya, 2021). In this key, the double face in which the processes of the government of life unfold is revealed, which in Foucauldian terms can be understood in the light of the notion of governmentality. It is a link between technologies of the government of others at the macro, social or population level, and technologies of self-government at the micro and subjective level by which individuals constitute themselves as subjects and govern themselves (Foucault, 2010).

4 OBJECTIFICATION OF A NEW NOSOLOGY

The medicalization of contemporary society incorporates new problems into its actions and creates new markets for consumption. Its expansion is made possible – fundamentally, but not exclusively – by the objectification of new nosological entities (diseases, discomforts, disorders, syndromes, etc.). This
mechanism operates a redefinition of life cycle processes, physical-emotional states, and risk factors, characterizing them as medical problems in terms of diseases. These processes and states are treated through medical intervention, claiming from scientific medicine the efficacy that contemporary society attributes to it (Márquez and Meneu, 2003), often without considering the balance between its benefits and adverse effects.

In the processes of medicalization, phenomena such as hyperprevention, overdiagnosis, pharmacologization, the moralization of health, risk culture, genetic susceptibility, and, perhaps the most paradigmatic, pathologization or invention of diseases are intertwined. According to the British Medical Journal, the Top 20 "non-diseases", published more than fifteen years ago, were led by an aging, work, and boredom, and include baldness, freckles, gray hair, ugliness, unhappiness, hangovers, and pregnancy (Smith, 2005). There are several aspects to note about the mechanism of the invention of diseases that drives the pharmaceutical-biomedical-technological complex. On the one hand, this mechanism follows a principle common to business logic: "The key to economic prosperity consists in the organized creation of a feeling of dissatisfaction," as Charles Kettering, vice president of General Motors, stated in 1929. On the other hand, the new nosological entities are incorporated into the diseases already typified, the drugs that are in circulation, and the new products that combine therapeutic actions or highlight some differential benefit for the existing ones.

In addition, it is convenient to recognize that the mechanism of the invention of diseases is not a monolithic procedure, but presents variants, as outlined by Rodríguez Díaz (2008) following Jörg Blech. At the moment when the notion of health mutates into that of quality of life and health services enter the era of scientific management, "pharmaceutical companies and medical interest groups invent ailments, because disease has become an industrial product that feeds and uses the desire to be healthy" (Rodríguez Díaz, 2008: 76). This mechanism of pathologization takes various forms: 1) life processes such as medical problems, such as the types outlined in the "non-disease" index; 2) personal and social problems such as medical problems, such as most mood disorders; 3) risk factors such as diseases, such as cholesterol, for which limits are set so that people with normal values are a minority; 4) rare symptoms such as epidemics of great spread, in the case of the medicalization of both male and female sexual dysfunctions; and 5) mild symptoms as indications of more serious diseases, so that certain disorders experienced by the majority of the population are disconnected from other symptoms with which they configure a clinical picture and constructed as diseases in themselves.

The invention of diseases is only one of the phases of symbolic engineering of the pharmaceutical-biomedical-technological complex, complemented by the construction of a persuasive discourse to install these diseases in society, together with the commercial launch of different products to combat them. One of the marketing strategies of the pharmaceutical industry is to investigate and identify biomedical indicators that are resignified as symptoms and incorporated into the field of pathological classifications. This neo-nosography then goes on to be worked on from the pharmacotherapeutic point of view. From
there, the development of brands-products is launched to cover the new needs generated. This is how the displacement of "normal" states (health field) to "pathological" states (disease field) occurs.

In the health market, the disease becomes an industrial product, a phenomenon for which to obtain an economic return. Pathologization expands the boundaries of treatable diseases and turns biological processes into medical problems. The "sale of diseases" is concretized with its social installation within the framework of an ethos of revitalization that erects the care and improvement of health as a moral imperative, and implies the correlative purchase of products to obtain it (Rodríguez Zoya, 2021). Hence, it is possible to conceive the health market in terms of a disease market, in which diseases are sold, but health is also sold in the form of endless diagnostic mechanisms, products, and treatments to achieve it: health merchandise.

The logic underlying these processes is explainable from the economic point of view of pharmaceutical companies in a capitalist system that needs to make great productive strides to survive. But, when this escalation compromises vital aspects such as the health of the population, it must, at least, be questioned. An attempt to intervene in this direction is the one that will take place next, from the analysis of the mechanism of the invention of diseases in the advertising discourse of the pharmaceutical industry.

5 THE ABSOLUTISM OF MALAISE IN ADVERTISING DISCOURSE

The "absolutism of discomfort" refers to the expression and expansion of discomforts in different orders of life, health, bodies, and subjectivities. The malaise that shapes the discourse of medicalization is not strictly linked to illness or guilt or repression – key to reading Freud's The Discomfort in Culture [1992 (1930)] – but closer to the subjective effect of the search for happiness, liberation, the perfection of health and well-being, and its correlative frustration. This discomfort assumes an absolute character due to its degree of profusion and is expressed as a discomfort mediated by the constant search for well-being and ideal body models, associated with the impossibility of fully achieving them; and as an immediate discomfort, experienced bodily, which finds in the possibilities offered by the pharmaceutical industry, dermo-cosmetics and medical technology, a way to mitigate the consequences caused by living itself.

In the subsequent sections, the methodological aspects and results of the analysis of advertising discourses of the pharmaceutical and dermo-cosmetic industries focused on the mechanism of the invention of diseases from vital processes are developed.

5.1 METHOD ISSUES

In this work, an analysis of advertising discourses of pharmaceutical and dermo-cosmetic products was carried out to identify and understand the meanings associated with the notions of body and health present in the discursivity of this industry. In particular, the analysis carried out brings together observations and interpretations of the meanings linked to life processes such as pregnancy, childbirth, and aging, integrated into the index of "non-diseases" cited above. For the construction of the sample of advertising
spots, we proceeded to deconstruct the index of the main twenty "non-diseases" published by the *British Medical Journal* (Smith, 2002) in different dimensions and assign spots of different types of products to the various aspects of each "non-disease".

The corpus of speeches analyzed in this work is made up of ten advertising spots, organized into three sub-samples corresponding to the categories of Pregnancy, Childbirth, and Aging. These are advertising pieces broadcast on open television and cable in Argentina in 2009, whose temporal delimitation obeys the accessibility criteria of this type of audiovisual material. The detail of each spot, the type of product to which it refers, and the pharmaceutical laboratory advertiser are presented at the beginning of the presentation of results.

It is worth making some previous notes related to the vital processes that are analyzed. It is possible to think that old age is the last age of life and that aging only affects adults who enter that stage. However, aging can be linked more to the process of one's life course than to old age itself. Based on this conception, an attempt will be made to give a chronological and linked order to the presentation of the observations resulting from the analysis process. It seeks to identify the meanings present in the advertising discourse related to each vital process, as well as the significant regularities related to the three. In this way, it will begin with the speeches on Pregnancy, followed by those concerning Childbirth, and concluding with those related to Aging, to which special space and attention will be devoted because the process of life is considered the main "non-disease".

5.2 PREGNANCY

The analysis of discourses related to pregnancy and childbirth is based on the analysis of four advertising spots. Regarding pregnancy, two products were considered: the Evatest pregnancy test – Elea Laboratories and the *Hinds Mama* body cream – Glaxosmithkline Laboratory.

The moment before knowing the state of pregnancy is represented by a motionless time: gravity loses its force of law, the juggler's game is suspended in the air, and the momentum of the wheels of a pair of skates is stopped as in a photograph. This shows the course in which nothing happens until a woman knows the result of her *Evatest*, the instant in which time is activated. The presentation of the product states: "Now it is easier to know what you want to know" and after listing its characteristics, closes with the phrase "New Evatest Easy, so that your world continues". The continuity of the world and time is made possible by the knowledge of the positive or negative state of pregnancy, a construction that is plausible when assessing the emotions and expectations involved around the moment alluded to. But, when we return to the closing syntagm and analyze the images, the displacement of continuity of time to the *detention of time* is noticed, from which it becomes interesting to review the articulations of the notion of *life* to the semantic fields delimited, on the one hand, by the signifiers stop-immobility-suspension-passivity and, on the other, by the signifiers continuity-mobility-activation-activity.
Continuing with this analysis, it is interesting to pay attention to the meanings that mobilize the **spot** of the Hinds Mama body cream in which a pregnant woman accompanied by her partner is shown at the time an ultrasound is performed. The product is presented after stating the phrase "That being a mother *marks your heart, not your skin*, in which the relationship between pregnancy-being a mother-marks on the heart marks on the skin is established. The significant chains articulated to *brands* can be stabilized according to the accentuation of an affective sense, where marks are equivalent to *emotional impact*, or a physical sense, where marks equal *stretch marks*. This second meaning is the one that manifestly takes up the speech of Hinds Mama and shows how when applying the cream, a rain of light envelops the belly of the pregnant woman and activates its "exclusive factor that [...] *It helps prevent and reduce stretch marks.*"

However, this sense of *protection* condenses in the cream a double meaning: on the one hand, it is linked to skin care ("Take care of your skin from stretch marks"), and on the other, linked to *love* (the woman draws with the cream a heart on her belly). Thus, the dermo-cosmetic discourse made manifest in the advertising of this cream does not leave any sense out of reach. This all-encompassing effect is exposed when indicating the moments for the application of the cream: "*Before, during, and after pregnancy*", exhibiting the processual and continuous character of health and body care. The advertising discourse installs the product as a therapeutic for stretch marks considered as sequelae of pregnancy. In addition, the advertising discourse about the pregnancy process condenses the two meanings given to the Greek word *pathos: illness* and *emotion*2. Thus, the discourse of dermo-cosmetic medicalization shifts the meaning given to the conditions resulting from this process of life – physical and emotional *marks* – to the field of the pathological and considers pregnancy as a "non-disease".

5.3 PARTURITION

Pregnancy and childbirth form a *continuum* both in real life and in the discursivity of the medicalization of these processes. However, considering that they were individually identified as two distinct "non-diseases", we allocate here a section for each. About childbirth, the advertising *spots* of Cicatricure Crema were worked on in its presentation *For scar reduction – Laboratorios Genomma*, and the body cream for babies Johnson's Baby – Johnson & Johnson Laboratories.

*Cicatricure Crema's* speech features a woman who confesses: *"When I saw the scar from the cesarean section and the stretch marks that I had left, I almost had an attack."* The emphasis placed on the "pathological sequelae" of both pregnancy and childbirth – in this case, because it was by cesarean section – on the mother's body, shows the importance that is attributed to the *mark* caused by these marks. Given this "picture", dermo-cosmetic products and treatments are recommended to *prevent* stretch marks and

---

2 The word Griego *pathos* gives its name to the branch of medicine that is responsible for the study of *diseases*, Pathology (*pathos* = disease; *logos* = study, treated), and also means *emotion* or *mood*. According to This last sense, *Pathos* is one of the three modes of persuasion along with *Ethos* and *Logos*, according to Aristotelian philosophy. In *Rhetoric*, Aristotle states that *pathos* is the use of human feelings to affect the judgment of a jury (Book 1, 1356a). Also, in the advertising discourse, The appeal to maternal emotions is a persuasive way to stabilize the senses advocated by this discourse.
reduce them when they are a fact. The spot of Cicatricure Crema states: "improves the texture and coloration of scars and stretch marks", an effect confirmed by the woman of the spot: "I followed to the letter the instructions and [...] I was surprised at the results." Thus, the speech of Cicatricure Crema seems to say: "Still, after childbirth, you are in time to reverse the marks that pregnancy has left on your body". Again, it is the application of a medical-cosmetic product that has the power to reverse the body marks that the medicalization discourse puts under the magnifying glass.

Analyzing the advertising discourse related to the birth process implies paying double attention to the meanings built around the figure of the mother and the child because as Johnson's Baby spot says: "When a baby is born, a mother is also born". In this case, as pointed out in the Hinds Mama spot, the meaning of protection is linked to both the care of the baby's skin and the love that the mother gives him. This articulation is highlighted by the brand of a line of products for hygiene and skin care of babies who, in turn, states: "Johnson's believes that your love can make your baby a much better person in the future." In this syntagm, the significant love occupies the place of caresses made when applying the cream to moisturize-perfume-sanitize the baby's body, from this other phrase: "Con your caresses and Johnson's Baby, a better world is born". Likewise, the significant world has displaced people, producing the effect that "if all mothers use Johnson's product line with their children, the world will be better."

Once again, the use of a medical-cosmetic product intervenes to obtain physical, health, and emotional improvement; particularly, in the case of Johnson's Baby, mediating contact between mother and child. The mother "suffers" – receives and suffers – the affective and physical marks of her pregnancy and childbirth, but also when using the cream to caress her child she leaves a mark for her future: "a much better person in the future". Precisely, from this moment space will be given to go through the meanings linked to that vital future leading to the aging process.

5.4 AGING

The results of the analysis of the advertising discourse related to aging are developed in detail considering that it is the "non-disease" that occupies the first place in the index. At the time of sampling, the themes or aspects that jointly contribute to the configuration of this vital process have been identified. In this way, to carry out the analysis of discourses on aging, six advertising spots were selected that address the issues of wrinkles, joint pain, the use of dental prostheses, and the use of diapers.

Undoubtedly, the appearance of wrinkles is the main concern associated with this stage of life, which is manifested through the profusion of products, advertisements, and the tone of their speech. Despite the abundance of spots, the analysis process allowed us to identify a set of significant operations of the advertising discourse related to the issue of wrinkles, which we systematize as follows:

2. Exhibition of the effects of the passage of time on the skin and its scientific basis.
(3) Declaration of the intention to stop the aging process and recover the identity and image associated with youth.

(4) Direct manifestation of the will to restore skin firmness.

(5) Presentation of the medical-cosmetic product developed to achieve the desired effects and explanation of its differential properties.

(6) Exaltation of the effectiveness of the product and display of results.

Below are the interpretations of the analysis of three spots on this issue: Cicatricure Cream face cream in its presentation For wrinkles and expression lines – Laboratorios Genomma, Roc CompleteLift cream – Laboratorio Johonson & Johonson, and Hinds Anti-Age body cream – Laboratorio Glaxosmithkline.

Through the advertising speech of Cicatricure cream – a product recommended by a renowned actress – it is asserted: "You know perfectly well that over the years it is noticeable in our skin", and the presentation of the properties of the product is made through the resource of scientific foundation: "In a study of more than 500 cases", "It was documented... ", "It was determined... ". For this, notions attributed to the medical-scientific vocabulary such as pentapeptides, cell regeneration, and collagen production are mobilized, and the slogan of the brand ends paradigmatically: "A scientific finding that can change the age of your skin". The changeable signifier delimits a semantic field of easy articulation with which the medical-scientific intervention is, ultimately, an intervention on the body and life, so that change is chained to the signifier intervention-manipulation-transformation-modification. Thus, the significance of a cosmetic treatment developed in pursuit of aesthetic-social parameters, which enables the change, renewal, and recovery of the freshness of young skin and, therefore, of the vitality associated with it, assumes the ethical-political tone that surrounds the debates on the scope of genetics, neurosciences, biotechnology, and biomedical technology, of clear biopolitical significance.

For its part, the slogan of Hinds Anti-Age states: "It helps delay skin aging", supporting the association between "passing of the years" and "marks on the skin". Faced with this, a group of women declares: "Today the struggle not to wrinkle is declared" and postulate the slogan: "Do not wrinkle!", which implies a double discursive operation. On the one hand, it brings into play two significant chains: (a) wrinkle-mark on the skin-passage of time-aging, from which the meaning is built to fight not to age; and (b) "not wrinkle (r)"-courage-daring-will-decision that, concerning the enumeration referred to those things before which women are encouraged to "not wrinkle" (high heels, short skirts, necklines, bikinis, "... that they have so much to give"), build the effect of meaning dare to show the body. On the other hand, the imperative tone of the slogan "Don't wrinkle!" and the sense of daring of the second chain, overdetermine and return to the signifiable aging of the first, so that rejuvenation is presented as a matter of decision and will. The way to achieve it is through a struggle waged against the passage of time ("Today the struggle is declared...", "Help delay aging..."); And its reward is the certainty of not losing the possibility of showing the qualities of a young body.
The sense of reversing and delaying the recently exposed aging is equally present in the significance of recovery built from the speech of Roc CompleteLift. This spot also presents the differential properties of the product through a technical vocabulary: "It combines two powerful ingredients", "reconstitutes elastin", and its effects are explained: "Results? 2 mm for a lifting that lasts" next to the overprint "7 hours of visible lifting effect". However, the distinctive nuance is to highlight the association between aging and identity through statements such as "With firmer skin, I am me again" and "With this face, I am rediscovering myself". The articulation of the meanings of recovery present in the first statement and that of rediscovery in the second build the effect of the sense of aging mask. The mask attached to the face during aging acts as a "new face" – that of wrinkles – that hides the "true face"; As if there were an identity essence – the one represented by the true, wrinkle-free face, that of youth – that the cosmetic treatment has the effect of revealing, preventing its loss, recovering.

The significance of recovery associated over time, physical qualities, and identity was taken into consideration with the speeches of three other advertising spots related to different types of products: the anti-inflammatory Reumosan – Gezzi Laboratories, the whitening of dental prostheses Corega Tabs – Glaxosmithkline Laboratory, and diapers for adults Plenitud Active – Laboratorio Kimberly-Clark Argentina S.A.

In the first of the three spots mentioned, an actor boasts that at 90 years old "with Reumosan, my mobility is recovered". The importance and positive significance attributed to recovery are evidenced by the phrase "A medicine to enjoy the life that is loved so much". Likewise, the announcement proclaims "Rheumosan is precise", where the double meaning of exact and effective, and indispensable can be noticed; Similarly, the recovery of mobility and with it joy and mobility (verified by the image that shows the same nonagenarian actor jumping in a park), requires a specific medication "for a certain stage of life". In other words, "that" stage of life requires a drug to be enjoyed.

On the other hand, the Corega Tabs spot reinforces the significance of daring to rejuvenate exposed in the Hinds Anti-Age spot. In the speech constructed by Corega Tabs, an adult couple says: "We recently decided to change our lives... for a healthier one", and explain that from the change introduced (doing gymnastics, quitting smoking, and drinking less coffee) "we look better ... even younger." The sense of better is retroactively stabilized from the young signifier and both overdetermine healthily; signifiers that configure the positive pole of gradualness in which, conversely, aging integrates the semantic field delineated by the chain worsening-loss-decline-inferiority-negativity-imperfection-disease. Thus, the meaning search for youth chained in exchange for life-decision-will – as presented in the spots of Corega Tabs and Hinds Anti-Age – is articulated to the semantic field constituted by the signifiers change-renewal-rediscovery-recovery-improvement-youth-freshness-vitality-joy-fullness-positivity-well-being-perfection-health.

However, the shift in this latter direction of the signifier change is interrupted and threatened by an obstacle that hinders the full realization of the "healthiest life" sought. The woman in the spot identifies the
factor that prevents and denies her complete well-being in the use of dentures and the difficulty in cleaning them, and then the figure of a dentist is introduced who presents the medical explanation of the discomfort and the properties of the advertised cleaning tablets. Finally, from the association established between dental prostheses and smile, the slogan of the brand states: "Never stop smiling", a syntagma in which the meaning given to leave is on the side of loss and the meaning of smile is articulated to the semantic field of joy-happiness-fulness-youth-well-being-health: what must be recovered to achieve the desired effect with the "change of life". As in the case of Reumosan, here too it is a medical-pharmaceutical product that prevents loss and enables the recovery of joy, and well-being and, articulated to these signifiers, all those whose displacement is stabilized from health.

Aging, meaning excluded from this semantic field, is something that must be prevented, therefore, it is tried to move away, postpone, convert and deny to recover the qualities through which life is enjoyed and lived fully. Given this significance, it is necessary to consider the discourse of the third advertising spot of this series. The phrases "Who says everything in the past was better? " and "Who says we can't? " mentioned in the adult diaper spot Plenitud Active, seem to question and challenge the sense stabilized by the articulation of aging-passivity-impossibility-discomfort. However, they only confirm the search for active fulfillment – such is the brand of the product – because it is lacking, and the desire/need to move away and differentiate from the meaning by which well-being is denied. The factor that denies and prevents fullness, in this case, is incontinence, hence in the advertising discourse of this brand of disposable underwear for adults the pronouncement "Fullness tells you yes" acts as if by denying that denial, it affirms the possibility of recovery of lost well-being. Intending to shift the signification of aging towards the significant chain of activity-possibility-joy-fulfillment-well-being, the spot shows an older couple dancing and another jogging in a park. Again, the factors to which the condition of threat, impediment, or obstacle to achieving the desired effects is attributed are first negativized, stigmatized, and then medicalized. So the action of a product developed by the medical-cosmetic industry for hygiene and personal care is a condition of possibility to recover, maintain and enjoy well-being and a full and healthy life.

6 DISCUSSION AND REFLECTIONS

The analysis of advertising discourses on the processes of pregnancy, childbirth, and aging allows to establish certain significant regularities that can be systematized from the following meanings and statements:

(1) Recovery. The discourses analyzed for the three processes of life reveal the claim to exercise power and control over time. The signifiers stop, follow, reverse, recover organize the semantic field that condenses the search for something lost in the present (physical, subjective, identity qualities), to recover what in the past ensured a full future and distance from discomfort.

(2) Trademarks. The meanings analyzed express the construction of a concern for the marks that the processes of life and the passage of time left on the body and skin (stretch marks, wrinkles, scars,
emotional impacts); while the discourse of medicalization shows that medical-cosmetic products provide a solution to such concerns and discomforts by concealing-correcting-reversing these marks.

(3) Protection. The discourses analyzed construct the meaning that life and the skin of the face and body must be protected from the passage of time, aging, discomfort, unhappiness, pollutants, and the environment. The search for protection and the claim to control factors conceived as threats or obstacles to achieving well-being enables their stigmatization and medicalization; operations supported by an advertising discourse that encourages the use of medical-cosmetic products, exalt their properties and effectiveness.

The analysis carried out did not have the purpose of identifying the meanings conveyed by the advertising discourses to indicate their foundation or explanation, but took into account the interplay of the discourses of consumers (demand) and laboratories (supply), condensed in the advertising discourse. The identification and interpretation of meanings start from the recognition of their social and dialogical character, as well as the arbitrariness of the significant articulations established by advertising discourse. Therefore, this analysis calls not for the critique-disapproval of the identified meanings but, rather, their deconstruction and the critique-analysis of the operations by which the senses are displaced and stabilized. "Non-diseases" such as Pregnancy, Childbirth, and Aging cannot be interpreted as such but negatively, that is, by the opposition and about social precepts and ideal models of health, well-being, fullness, beauty, youth, happiness – generated, in part also, by the same advertising discourse – against which the semantic field of discomfort is constructed as antagonism.

At the theoretical level, we can offer some reflections on the deconstruction of symbolic engineering deployed through the advertising strategies of laboratories. The operation begins with the invention of diseases, a mechanism that assumes various variants by which they become and present different normal processes, personal or social problems, mild or infrequent symptoms, or risk factors such as diseases. A discourse is constructed that exaggerates the relevance and impact of these diseases on health, well-being, or quality of life, based on the use of metaphors to persuade potential patients about the self-perception of symptoms. In addition, pharmaceutical companies implement marketing strategies aimed at "selling" to the population and health professionals, "non-diseases", new products aimed at combating them, and the benefits of medical intervention.

However, a second observation allows us to notice that what a disease is, obeys a contingent construction that does not necessarily refer to a biological referent. To invent a disease is to give a name to a state that supposes an abnormality, alteration, or imbalance. To think of the contingent character of this denomination supposes the non-univocal of the meaning and a fertile polysemic and polyphonic contamination that take place wherever linguistic hygiene could be claimed. This contingency is a condition for diverse voices and interests to converge in the field of meaning in the struggle to stabilize its meaning.

This allows us to notice that the mechanism of the invention of diseases operates through a metaphorical displacement. Agnes Heller (1995) states that "disease [...] It appears regularly in our culture
with a metaphorical sense," emphasizing the change of meaning and the political dimension of metaphor. There is something in that displacement that is hidden, that is denied or silenced, but what is silenced is expressed in another place and another form: it appears as a symptom. The case of certain personal and social problems that manifest themselves through symptoms that, in turn, are converted into diseases such as social phobia or stress, is paradigmatic of this reasoning. Likewise, mild or infrequent symptoms at the organic level are also elevated to the range of diseases.

Thus, the disease can be conceived as a politicized metaphor for various social phenomena at different times. Likewise, in the construction of diseases, the symptom occupies the place of the disease, operating a metaphorical displacement. Graphically: metaphor and symptom are on one side referring both to the significant disease on the other. The disease is the state in which they condense from biological alterations to social problems. In this regard, it is interesting to follow Heller (1995:73) when he emphasizes that "there is a (bio)politics of metaphorical meanings that have been emerging before us. If the metaphorical dimension is not grasped, health policy will remain a mystery."

Thus, it was open to postulate a link between Heller's (1995) approach to the disease as a metaphor, in which there is a displacement and something remains denied, and that of Esposito (2005) on the movement of negation of the immune procedure. What is not named in the political metaphor of the disease, what is displaced and remains denied, is precisely what is presented by denying or threatening life, what the immune procedure seeks to deny to protect it, especially at the social level.

Another observation that is inserted in the previous arguments concerns the conception of the disease/health pair as commodities that are produced and circulated in the health/disease market. In this market, consumers/patients relate to diseases that assume a certain form, as well as to a certain form of health that is offered/sold to us. However, the processes underlying the establishment of these forms – as well as the social relations and interests that exist in them – are not directly available to the eyes and consciousness of those who live and practice these forms of health/disease. Therefore, one can think of health/disease-commodity in terms of fetishism and ask ourselves why the set of symptoms that make up a (new) disease or the proclaimed qualities of a healthy life assume one form and not another.

All this allows us to show the relevance of the mechanisms of symbolic engineering of pharmaceutical and dermo-cosmetic companies for the problematization of medicalization processes. In a model of society in which the improvement of the quality of life and health becomes an obsession and medicine is made the main means to achieve it, a large part of the population is labeled as sick. Even before

---

3 The displacement operation is associated with the rhetorical figure of metonymy rather than a metaphor; However, here I speak of "metaphorical displacement" under the understanding that metaphor entails at least one metonymy.

4 Sigmund Freud [1991(1900)] in *Interpretation of dreams* used the notion of condensation associated with the metaphor. Condensation is one of the mechanisms by which manifest content of dreams It is presented in a syntagm as a metaphor for many other senses of latent content. The other mechanism is that of displacement, by which the latent thought of the dream is metonymically displaced and assumes a form in the manifest content.
birth, through the strict medical controls to which mothers are subjected, the first identity of the individual is that of being patient.

The strategies of the medicalization of life and health contribute to the (re)configuration of subjectivities and social meanings, making them a field of conflict. The question that arises before these observations are what to do. An ethical-methodological position – if I may use the combination – to assume from the Social Sciences and Communication is to conceive the field of meaning as a space of power and conflict, and to denaturalize and problematize definitions and meanings as a political task, especially when it comes to definitions related to the body, health and life. A contribution in this sense has been the commitment to this work.

FOUCAULT, M. La crisis de la medicina o la antimedicina. La vida de los hombres infames, p. 67-84. La Plata: Altamira, 1996a.

ABSTRACT
Expertise is inserted in the most diverse areas of knowledge, standing out as a relevant tool, whether in a judicial or administrative approach. The purpose of this study was to show the importance of expertise in professional activity related to civil defense and protection. The justification and motivation of this work are in the multidisciplinarity that involves this area of public security. For the development of the present study, it was sought through the case study, to evidence the contribution of the expert report to the actions of prevention and response of the civil defense according to the PNPDEC. In the introduction, the objectives and relevance of the study were presented. Then, there is a theoretical presentation on expertise (concepts, documents and relevant issues), moving on to an overview of the judicial and public security systems, and a brief description of the structure of the expert system in Brazil. Subsequently, an approach is made on Civil Defense and Disasters, Federal Law No. 12.608, of April 10, 2012, which established the National Civil Defense and Protection Policy - PNPDEC, IN 36/2020, COBRADE, Risk Management of Disasters, and some considerations on disaster expertise, in order to obtain a correlation with the proposed theme. The methodology adopted and the case study are then presented, which deals with a forest fire that occurred in the Gericinó-Mendanha Environmental Protection Area, municipality of Nova Iguaçu/RJ, covering initial considerations, contextualization, survey and analysis of data extracted from the forensic report. The correlation of the data obtained with the actions of civil defense, prevention and response follows. The results and the discussion of the correlation of the data as proposed are presented. Finally, the final considerations where it was verified that the objectives of the work were reached and future applications were suggested.

Keywords: Defense and Civil Protection; Expertise; Disasters; Forest Fire

1 INTRODUCTION

The global security of the population is the duty of the State, right and responsibility of citizenship, as recommended by the Constitution of the Federative Republic of Brazil of 1988, art. 5:

All are equal before the law, without distinction of any nature, guaranteeing Brazilians and foreigners residing in the country the inviolability of the right to life, liberty, equality, security and property (BRASIL, 1988).

Like other services focused on public policies, the activity of protection and civil defense is provided for in our legal system.

Civil defense is regulated by Law 12.608/2012, which establishes the National Policy of Protection and Civil Defense (PNPDEC), the first law in the country to reduce the risk of disasters.

The field of action of the civil defense is very comprehensive, requiring the interaction of different
areas of knowledge, being in this case, multidisciplinarity is a reality in civil defense management.

The expertise, translated in the expert report, has some peculiarities that bring safety in its use as a tool, such as:

- It is inserted in several areas of knowledge.
- It is based on science and technology.
- Based on impartiality.
- It has proof value.

The problematization of the research can be translated into the following: Does the systematic analysis of the expert report contribute to the activities of protection and civil defense?

The general objective of the study was to evaluate the relevance of expertise as a diagnostic tool, capable of assisting managers and protection agents and civil defense in decision making in the performance of their functions.

Specific objectives:

- Characterize the expert activity and its relationship with the protection and civil defense.
- Present, through a forest fire case study, the contribution of the expert report according to the PNPDEC.
- Point out the relevance of expertise to managers and agents of protection and civil defense.

The relevance of the study comes from expanding the knowledge of professionals in the area of protection and civil defense in relation to expertise.

2 THEORETICAL REVIEW

2.1 EXPERTISE

The Expertise can be requested when there is a controversy of techno-scientific knowledge. It is an important means of scientific proof in the investigative process, it must be performed by a qualified professional who has technical knowledge of the area, aims to prove a relevant fact in clarifying a process and ends with the issuance of a report.

The Expert must have a higher education and be an expert in the subject that he also examines, has moral suitability, ethical and a course of expertise.

Proof is every element by which the existence and veracity of a fact is shown or confirmed. The Expert Proof for being a scientific object, with specific rules and methodologies, is not subject to subjectivity, acquiring so, reliability and relevance.

The Expert Report is a formal technical piece, which must be reasoned and impartial. The expert materializes the expertise in the expert report, which contains the results of the examinations, observations and conclusion.
Place of Forensic Examination is every place in which an event occurred or houses some object of interest of justice. The sites can be classified as immediate, mediated or distant and, as for the conservation of the site, it can be classified as suitable and disreputable.

The preservation of the site is fundamental and indispensable for a technical investigation of quality and credibility. Therefore, it must be the responsibility of all organs and institutions operating in the public security system. However, it is emphasized that the day of any accident or disaster with victim, saving life is a priority.

The State has a relevant role in the expertise, because in criminal justice, the State is the holder of the action, so it must provide the necessary means for the justice to obtain information for the trial process. Thus, the public and police security system comprises a fundamental point of information collection and investigations.

Considering the context of disasters, civil and criminal expertise are the most recurrent in this situation. Civil Expertise is governed by the Code of Civil Procedure (CPC), Law Federal No. 13.105/2015. The Criminal Expertise is governed by the Code of Criminal Procedure, Decree-Law No. 3,689/41.

2.2 APPROACH TO CIVIL DEFENSE

- Establishes the National Policy of Protection and Civil Defense (PNPDEC).
- It provides for the National System of Protection and Civil Defense (SINPDEC) and the National Council for Protection and Civil Defense (CONPDEC).
- Authorizes the creation of the Disaster Monitoring System, among other measures.

According to federal law 12.608/2012 it is the duty of the Union, states, the Federal District and municipalities to adopt measures to incorporate the reduction of disaster risks.

Measures for disaster reduction involve study, knowledge of risks, mapping of areas and monitoring. In this sense, the PNPDEC provides for a systemic approach to prevention, mitigation, preparedness, response and recovery actions, where priority should be given to preventive actions.

In order to monitor and record disasters that occurred throughout the national territory, the Integrated Disaster Information System (S2iD) was created in order to maintain an updated database.

IN 36/2020 establishes the procedures and criteria for states and municipalities affected by disasters, to decrement an emergency situation or a state of public calamity, before requesting federal resources for civil defense actions.

The Brazilian Disaster Classification and Codification (COBRADE) is organized by categories and identified through a numerical code. Its use allows better communication of events that occurred and the recording of information.

To reduce the risk of disasters, PNPDEC objective, it is first necessary to identify the risks and then manage them.
In Risk and Disaster Management, two distinct phases can be identified:

The first is related to Risk Management (pre-disaster) and involves prevention, mitigation and preparedness actions. They refer to the measures taken before the disaster occurred, with the aim of eliminating or minimizing risks or impacts.

The second phase, disaster management (post-disaster), involves the disaster itself, concerns the response and recovery actions, in which the goal is to save lives, help in recovery and resume security conditions and the restoration of the community.

Some considerations about disaster expertise:

- The National Civil Defense has adopted the Operations Command System (SCO), a management tool that aims to stabilize a critical emergency situation.
- As for site isolation, the SCO does not define who is responsible.
- The SCO recommends that the first to arrive at the emergency scene, someone formally take command of the operation, but as the operation progresses and needs it can be passed on.
- The expertise carried out in disasters, unlike the expertise performed with an scheduled date, has some particularities given to the situation, because it involves popular commotion, injured people, missing persons, press, finally, extreme stress.
- In fact, depending on the type of event, the relief is initiated by the local population, either by the Residents Association, Community Leader, Head of Trafficking, Local Volunteer. Therefore, the importance of training, action plans and sharing of knowledge of risks throughout society.
The priority is to rescue the victims.

After the rescue activities of the victims, the place must be completely isolated, with preservation of the site, and thus remain until the realization and completion of the forensics.

It is emphasized that at first, even if the event is not linked to any type of crime, the expertise follows the same dynamics of site examinations, always avoiding unnecessary interventions.

The concern with the preservation of the site is always the responsibility of the police authority and should be in everyone's interest. The relational issues between the different institutions that act in this scenario are essential for a satisfactory result of the expertise.

3 SEARCH

3.1 METHODOLOGY

The methodology used in the study was the literature review, through bibliographic research and documentary analysis, together with a forest fire disaster case, through expert examination of a disaster site, according to COBRADE. The universe of the study is the very expert report of CBMERJ and the target audience are managers and agents of protection and civil defense.

3.2 CONTEXTUALIZATION

Contextualizing the case study, Forest Fire, according to the Glossary of Civil Defense is the spread of fire in forest areas, which usually occurs in periods of drought, and may occur spontaneously or be provoked by man.

According to the Forest Code, it should be determination of responsibility for irregular use of fire on land, public or private.

In the state of Rio de Janeiro, site of the case study, CBMERJ is one of the agencies responsible for fire forensics.

In the case of fire forensics performed by the Fire Department, the purpose is to investigate to elucidate the cause and not authorship. The intention is to know how the fire occurred (start, spread, development and consequences) to avoid the occurrence of new events with the same characteristics (identical risks). Thus, supporting the preventive operating system, regulatory and combat measures.

3.3 CASE STUDY

Forest Fire occurred in the Protection Area Ambiental (APA) Gericinó-Mendanha, Caonze neighborhood (K 11), Nova Iguaçu/RJ.

The fire at inane about eight hectares (80,000 m²) of a conservation area.

In this case, the APA is a Sustainable Use Conservation Unit, and nature conservation must be compatible with the sustainable use of natural resources.
CBMERJ Expert Report concluded:

"... a DIRECT PERSONAL ACTION, characterized by the willful action of INCENDIARISM, by person or people who started or started the fire in various points, characterized by multiple outbreaks, not interconnected by the logical gait of the flames, having, by one of these foci, caused a large-proportion fire on the slope of the hill located next to The Calixto de Aguiar Street, close to number 125”.

Therefore, according to the report this was a fire with criminal cause.

In this case, the expert report is forwarded to the police authorities to continue the investigation and other necessary measures such as civil and criminal liability.

3.4 REPORT STUDY

The procedure for the survey and analysis of the data obtained was performed from the technical subdivision of the expert report, with the information referring to objective, subjective and complementary proves, considered relevant for prevention and response actions, according to the PNPDEC.

Thus, the 44 data obtained, according to COELHO (2022), were listed in table 01, grouped according to the type of test.
Table 1: Data obtained from objective, subjective and complementary tests of the Expert Report of Examination of Forest Fire Site.

Table 2 revealed the data obtained from the tests with prevention and response actions.

For the classification of the data, we considered the data related to safety, supervision, education and protection, that is, data related to the non-occurrence of the fire (pre-disaster) with prevention actions and data related to the dynamics of the fire and its combat with the response actions, or even in case the data are related to both situations.

Table 2: Classification of the data obtained according to the evidence of the Expert Report of Forest Fire Site Examination with the actions of prevention and response of the PNPDEC.

3.5 DATA CLASSIFICATION RESULT

As a result we have a total of 44 data listed:

- 32 were related to prevention action;
- 21 were related to response actions;
- 09 were related to both actions.

Thus, the relevance of expertise as a tool to be used in civil defense and protection actions is
highlighted, as shown in the following graph.

4 FINAL CONSIDERATIONS

The expert reports are evidence and, therefore, constitute solid and proven foundations for the correct adoption of measures, which use the data pointed out by the report, as a liner of their actions.

The expert report is a document of legal and probative value, thus being a legal instrument, which allows complementary action in different areas.

The instrument of expertise, brings to managers and civil defense agents:

- Technical knowledge;
- safety;
- assertiveness in decision-making;
- implementation of actions.

A skill performed per qualified person, in a disaster site, contributes with information and specialized knowledge that may be appropriated by civil defense professionals as reference material, directing prevention and response actions.

Considering a disaster scenario, the contribution of expertise is relevant:

- In the elucidation of the fact that occurred;
- in verifying the cause of the problem;
- identification of victims;
- civil and criminal accountability, when it is the case.
According to federal law 7.347/85, it is imperative to the public servant or authority by force of the function, that when it learns of fact or activity that configures damage to the environment, communicate to the Public Prosecutor."

**Responding to the problematization**, it has been that the expertise is fundamental in the scope of Civil Protection and Defense, because they allow the realization of a diagnosis, contributing to promote actions, information, recommendations and changes in legislation to prevent other similar situations from happening, feeding a feedback loop of relevant information.

**Suggestion for future** work, the use of this methodology with other types of disasters, according to COBRADE, either in prevention and response or other actions, in order to record the facts, events and actions, aiming at strengthening the system of protection and civil defense.

ABSTRACT
This article deals with visual internet memes, their conceptualization and uses in conversation on social networks, especially Facebook, where the empirical observation that gave rise to the present research took place. It highlights six types or categories of memes most frequently in digital circulation and emphasizes comic expression as an emerging cultural skill of social network users.

Keywords: meme, social networks, digital conversation, humor.

1 INTRODUCTION

In the internet environment, the term meme designates a message disseminated quickly and intensely, as if there was a communicative contagion between internet users connected through sharing and likes on social networks of conversation2, blogs and other services based on www (World Wide Web). An internet meme can be a text, an image or an inseparable combination of text and image, in short, a unit of communication always able to be modified collaboratively in its media circulation, by users who perceive, in the mensagem, the opportunity to express an opinion in a comical way, that is, making a joke.

Originally employed in biology to designate an evolutionist model of an imitation-based gene, the term meme was created by zoologist Richard Dawkins in 1976 in his book The Selfish Gene, by suppressing the initial syllable of the English term mimeme [mimeme – mi = meme] which has the same Greek mimese root, imitation. In this original way, the term was adopted and consolidated worldwideto sign any verbally and/or visually expressed idea that propagates from one mind to another as a replica, copy, parody or, even, as a variant modified and evolved from an original source, even if that source cannot be identified as such, in the dynamic, borderless environment of the World Wide Web.

In the scope of cyberculture, a meme can be an image, a phrase, a text, a sound, a movie, or any message that constitutes a unit of information and which has the skills to be:

a) intensely transmitted by the media (notifiedly, the switch-mediated);
Everyday conversations on virtual social networks have changed the social behavior of thousands of people worldwide. Very popular messages, express the emergence of communicative skills previously little explored by the ordinary user, who has found in comicty the motivation to maintain and even amplify their social reputation among friends, followers and visitors. 

More than developing visual literacy, memes have provided, among amateurs, the remarkable development of comic narrative skills (fig.1).
new literacies depend on learning and practice in the use of tools (image editing software and applications, for example) that enable, albeit intuitively and user-friendly, the acquisition of skills restricted to professionals who, in front of the blank page, had (and still have) the responsibility to create solutions to on-demand communication problems.

In addition to technological literacy, a basic requirement for anyone who manipulates digital devices, the comicity or ability to make a joke with the help of visual resources and synthetic texts, whether to face an uncomfortable subject or to socially express a personal opinion, is the most evident ability to track what we've done in the Facebook environment over the course of three years, following messages posted on the timeline of people close to the circle of friends of one of the authors.

We have identified that the communicative exercise on Facebook through images and humor has positively impacted the dressage of the look and the spontaneous visual literacy of the user audience frequente. Immersed in the same environment, we realize that this audience is finding — in adding emoticons, emojis and other graphic symbols to the phrases typed or in the use of images of own authorship or reposted in messages hybrids — alternatives to overcome difficulties imposed by the coldness of computer mediation in your personal contacts.

In the feedthrough digital social networks, the absence of voice tone or gesture and facial expression — body elements typically used, consciously or not, to convey a diversity of information about the emotional states present at the time of contact — is being replaced by other graphic and visual resources in conversations where the face-to-face condition is not the main route of relationship and the typical conversation takes place from one to many.

In social networks such as Facebook, for example, the desire to be popular, to be heard, to influence others and, above all, to gain social reputation among members of one or more groups and to enjoy this differentiated status, can be noticed by the existência of strategies, widely disseminated, to gain an increasing number of followers and likes.

Sharing, before the Internet, meant a reciprocal and coordinated action between people who knew each other; from access to the world network, especially through mobile devices and wireless connections, message sharing has come to present nuances ranging from the personal sharing (among individuals from the same circle of friendship) to civic sharing (of groups trying to transform society), through public sharing among researchers, fans, project participants, collaborators (SHIRKY, 2011, p. 154). This means that the motivations to share something have broadened and the use of images in shares has accompanied this trend of expansion.

3 FEATURES OF DIGITAL CONVERSATION

Many relationship sites are also spaces of conversação and are distributed in some basic categories by usage preferences: share content, news and opinions; post photos and videos; collect images; listen to and post songs; locate people, shops and services; professional contacts, among the main sharing interests.
Facebook is also one of the largest and most popular dating and conversation sites, itself for designing with friends, disseminating full profiles of people and companies, sharing photos, videos, links and tracking the lives of other people and companies.

Even though they cannot characterize the conversations held on Facebook as stricto sensu dialogues, communications that remain there as public can be considered conversations asymmetric (one-to-one; one-to-many), asynchronous (do not depend on the interagents being, all, connected at the same time) and verb-visual, since the images often integrate increasingly evident messages from and shared.

In digital conversation, the synchronicity between the agents involved and the exchange of speech shifts, characteristic attributes of natural conversation, no longer qualify the interactions that take place on social networks. Through them, the conversations now incorporate the use of images - emoticons, emojis, drawings, photos, videos, typographic features - to add an emotional condition to the speech or to facilitate shares and number of likes of the illustrated message and thus maintain high social reputation among circles of friends and followers.

In natural face-to-face conversations, it is possible to identify the following parameters: interaction with at least two speakers; occurrence of at least one shift change between speakers; temporal synchronicity; coordinated actions between interlocutors and focus on a common task (MARCUSCHI, 2006, p.15).

In digital environments, some of these parameters have been updated taking into account that what matters, in social networks, are the quality of relational ties and social capital built between the interagents. According to Recuero (2009, p.122), the parameters of cyber conversation are more complex than those previously identified by Marcuschi and include: ambivalence of synchronicity and asynchrony in interactive events; multiplicity of interagents; use of conversational markers to indicate shift or topic exchange of conversation; organization of speech shifts for non-conversational observers to follow a sequence of speeches; permanence or extension of a conversation in time; migration of conversations to other platforms and devices (RECUERO, 2009, p.122).

In our empirical research on conversation on Facebook, we found that, in addition to the parameters mentioned, the incorporation of the image in conversations between users points to a change in the traditional balance between verbal language (spoken and written) and visual syntax, where, as a rule, verbal language predominates over communication by images, indicating the emergence of new complementary relationships between word and image, also available to amateurs in their colloquial contacts and computer-mediated daily life.

4 USE OF IMAGES IN NETWORK CONVERSATION

A selected example of aProfile 6 on Facebook, not associated with any profession related to visual communication, serves to illustrate the evidence of the growing use of visual or verbo-visual
messages in everyday conversations by digital networks. The selected profile shared or produced about 200 posts in five years of existence of your Facebook account (From July 2008 to July 2013), concentrated greater relationship activity after two years of use of the network. Four posts of this profile were chosen (fig.2), with an interval of at least six months between them, taking into account different degrees of manifest skills, such as the use of resources externos to the site, incorporation of images to the main message and complexity of the narrative.

Figure 2 Four posts (A, B, C, D) of a Facebook user in a five-year interval: incorporating visual resources into verbal messages.

The first post (fig.2A) coincides with the first publication on its timeline: it is an album of nine photos without text insertion, a feature made available by the network itself.

The second message (fig.2B), published a year later, shows several verbal posts, without images, also demonstrating a user's preference for verbal communication. The third publication (fig.2C), four and a half years from the first, shows a leap of narrative and technical skill. The user searched another site (external to Facebook) a tool to edit personal photos and add text on them, pointing to a learning in the realization, for the first time, of a verb-visual message more elaborate than the simple sequence or juxtaposition of image and text. Two months after this experience, the user published a message consisting of editing a photo on a ready image (fig.2D) to illustrate a Christmas message aimed at her circle of friends, demonstrating a familiarity with graphic features previously not evident in her publications preferably
This example, while isolated, illustrates the cycle of many network users who have evolved from simple visitors to leaders or veterans (KIM, 2000) and on this journey have engaged with websites, applications, and programs that have helped them make their messages more attractive for reading once that there are many stimuli that cry out for the attention of internet users at the same time and the perception is selective. When new, the most common is the publication of personal photos; as you know other editing sites, your personal publications become more elaborate, hypermedia and impersonal, i.e. editing photos, images, typography and sounds becomes, along with the choice of topics covered, a value to be respected on the network. In this context of social escalation, graphic humor is an ingredient that yields likes, comments and shares.

Among network users, specifically Facebook, there is no concern with the identification of authorship of messages circulating around the environment with the characteristics of visual or verbal memes: its author may not be the creator, but simply its replicator or curator. Therefore, it is said that the propagation on the Internet follows a rhizomatic model, that is, not linear, nor hierarchical, by which any user can influence the utro at any point of the relationship established between both.

The images that stand out in network conversations are those that integrate image (drawing or photo) to text (title, text, caption) in an inseparable way, such as an iconotext or a standalone communication unit. It is noteworthy that, although available, sounds and videos do not predominate (at the time of research) in what we agreed to call conversation via Facebook. They even appear in that environment, but with less intensity than predominantly fixed memes (with still images). In general, however, we can state that the image carries for digital conversation impact, power of attraction and speed of propagation.

5 MEME TYPES AND EMERGING SKILLS

The use of images by users (novice or experienced) emerges as a creative alternative, made available by software and applications that are easy to handle, favoring the development of communicative skills that are no longer limited to the temporality of the written word or the talent of trained professionals, but include the comical and spontaneous expression of amateurs who, before the opportunity, did not even imagine themselves producing or editing verb-visual messages.

In different degrees of interdependence, words and images are combined in message units to circulate, on different platforms, jokes about current affairs. These jokes function as visual memes, that is, as rhizomatic manifestations, that can be replicated or shared with changes in the same social and/or other contexts media of interpersonal communication. It is important to remark, however, that not all messages with images turn into memes of popular repercussion in relationship networks.
The example on the left (fig.3) shows a self-help message, illustrated by the drawing of the character Charlie Brown by cartoonist Schulz. In this case, the image is merely decorative, as well as the colors that serve as the background for the verbal message and, even shared, did not come to be considered a meme. In the example on the right (fig.4), a meme heavily replicated in the country during carnival 2012, the images in juxtaposition speak for themselves: the baby who laughs while tearing paper and was, because of this, used in an advertising campaign of a financial institution to raise awareness of customers to save paper is compared with the adult who, when contradicted in a trial of parades of Samba Schools, in the Carnival of São Paulo 2012, rips the results during calculation transmitted by television station. The two photos that make up the message on the right, sequenced by diagramming (high and low), lead readers to the comical conclusion: the baby grew up and, adult, cannot contain himself before any role; it tears it even if it is the expression of undue behavior, out of time; hence its satirical joke effect.

Three attributes characterize the memes: (a) fecundity to generate copies, (b) fidelidade so that copies, even modified, maintain similarity or recognition with the source that generated them and (c)
longevity, ability to remain available in time and thus allow new visitors to have access to the material to replicate it or share it with mutations (DAWKINS, 1976, p.15; RECUERO, 2006, p. 3).

Of the three attributes, longevity is, in our opinion, the least characteristic attribute, since it is the intensity of dissemination and not its permanence in time the most characteristic trait of the memes we find in circulation on Facebook, during the period of our empirical research. Some of them, such as the elutrado in Figure 4, achieved more than a thousand shares in just hours after the fact was broadcast live on television (21 Feb. 2012); then, their access dropped abruptly and remained well below a hundred accesses per month during the other months of the same year (LIMA, 2014, p.96).

The messages (only images and text images) were collected from the so-called news feed of author Ana Cristina Paula Lima, intre 2011 and 2014. The selection – about 200 messages – was defined according to the confirmation that each of them generated more than one similar post and presented the propagation characteristics of the memes. When analyzing them, we identified six categories of memes:

1. memes with the same theme (semantic emphasis);
2. memes related to everyday chronicles (semantic emphasis);
3. character memes (emotional emphasis);
4. celebrity memes (emphasis on the public character of the message);
5. memes with the same narrative structure (morphological emphasis) and
6. memes with schemes (syntactic-semantic emphasis).

Memes with the same theme encompass variants of the same semantic root, easily identified as matrix idea. The meme "Cantada de mason" (fig.1) exemplifies this category: any male image of half body, dressed in uniform and safety helmet, represents a construction worker; the phrases that accompany the image express am sung (flirtaties) masculine very popular in humor programs and in the imaginary about loving conquests.

In the Category Chronicles of everyday life, the creative emphasis is also semantic: a subject, usually reported by the media, becomes the subject of jokes, cartoons, comics and memes and has its duration related to the permanence of the subject in the media. The high price of tomatoes during the 2013 off-season yielded several memes on the subject in the year (figure 5A).

The memes of characters, also known as memefaces, are the ones that most identify the culture of social networks: rustic drawings of facial expressions, used in the same line as the old emoticons, represent situations or emotional states. Such designs (Figure 5B) would have arisen from the combination of the Windows Paint tool with the little manual dexterity of amateur users, which would have opened a grunge aesthetic, much appreciated by young people worldwide.

To exemplify the celebrities that give rise to memes, we highlight the messages conveyed through the photo of actor Gene Wilder, starring Willy Wonka (ironic) in the film The fantastic chocolate factory, 1971 (fig.5C).

The category memes with the same narrative structure has emphasis on form, and theme, images, photos and text may vary, remaining invariant only the morphological structure used to tell a story. The
example of figure 5D entitled "How I see myself, how others see me, how reality is" falls into this category and allows a series of adaptations and mutations.

A variation of this latter category is the one that uses graphical schemes to tell a story. "Father and mother: when and for what you seek them", in three variations, is an example of this category of visual meme (fig.6).

6 FINAL CONSIDERATIONS

The six categories of messages, identified by us as the most frequent types of visual memes among the hundreds of Facebook posts we had the opportunity to track as collective networking exercises, alerted us to the identification of some emerging skills, of which we highlight:

a) association of text and image in autonomous units of information/communication;
b) synthesis of ideas;
c) collective intelligence;
d) use humor to make you laugh.

We observed that associating images and words in messages of a comical nature requires a commitment to communicative efficiency, more than with aesthetics or visual literacy. However, communication through verb-visual messages has only become an expanding reality thanks to the tools that the network user has learned to manipulate or that applications made available with a simple touch. Without the image and video editing sites and applications, for example, no advance of this ability could have been made at the speed that materialized, even with all the motivation in the world and the connective force of the internet. The appropriate tools encourage the user to manifest what their imagination creates or transforms.

Without and in the discussion about whether it is the figure of the amateur who has driven the development of tools (software, apps) or, in fact, if it is conditioned by these devices, the fact is that there is a sense of autonomy and freedom among users who often talk through social networks. This sensation corresponds to a noticeable improvement in the quality and language of shared messages and in the technical domain, at least of simple graphic features such as video scene capture, photomontage, photo editing (brightness, contrast, sharpness, shadows, saturation, framing, addition of filters), addition of lines of text and frames, to name the most common visuals in the creation of internet memes.

The synthesis – communicating very little with few elements – indicates a linguistic gain that is evident when users dive into the cyber environment and, by frequent use, naturally adapt to the demands of speed and brevity of the various relationship platforms. A notable example of this ability is the use of memefaces to share short, simplified and, at the same time, full of feelings stories.

In sharing environments you can perceive one idea inspiring another; the connection between them can be aesthetic or content. Through collective learning, the individual immersed in the networks, motivated and engaged with the possibility of building his identity through it, starts to produce, create and develop new social skills. The technical domain is gradually acquired, day after day, in a practical way and places the amateur half a minute between the average user and the professional designer (FLICHY, 2010). In the categories of memes that we addressed in the previous item, it is possible to perceive the presence of a collaborative collective intelligence in the variations that a message suffers when expanded, in a rhizomatic way, by the network of friends, friends of friends, likes and occasional visitors.

The diagramming, the choice of typography, the contrast of figures with neutral background, the use of images from specialized sites, the intention to seek popular images to facilitate the understanding of the content to be transmitted, all these characteristic features of the memes evidence a collective creativity for which, more important than the preservation of authorship, is the exponential expansion of the idea; hence it is not common to desta personal style in this medium.

Humor, another emerging skill on Facebook, is a strategy with a dual role: while fulfilling its entertainment function, it promotes – socially – those who use it. Being funny has a special social value in
building the desired reputation among members of a community. The diversity of Facebook pages dedicated to humor and the number of posts and shares with this approach circulating there revealed how much the comic vein has been practiced and developed by the frequent use of social networks. By exercising this skill, the average user is the comedian, professional screenwriter, for whom the sense of rhythm, timing, sense of opportunity and critical observation of customs are the ingredients that must be dosed to the final result of laughter.

All these skills - synthesis integrando image and text; collective creation and humor - stem from a discursive genre proper to digital networks, where the colloquiality and efficiency proper to personal communication, face-to-face, are achieved by graphic resources and humor, so that, even mediated by machines, the conversation maintains traces of emotion, proximity and fecundity.

Our investigation revealed a time when the relationship between memes and skills arising from their frequent use in digital conversations is collaborating in the definition of cultural traits emerging from the digital environment.

ABSTRACT

Burnout Syndrome (BS) is a set of signs and symptoms of psychological origin, in which the individual presents, mainly, physical/emotional exhaustion, psychological exhaustion, depersonalization and low personal fulfillment. Professionals who maintain an intense work routine are more predictable to contract Burnout, including medical students among these individuals. The present article aims to evaluate the prevalence of risk factors as well as the consequences of Burnout Syndrome in medical students. The present study is an integrative literature review of a quantitative nature. PubMed and Medline were used as a database. The descriptors in Health Sciences (DeCS) were used: "medical students", "burnout syndrome" and "public health". Among the analyzed literature, it was noted that the prevalence of Burnout is approximately 50% among the academic environment. Of this total, 25 to 75% refer to intentions of dropping out of the course, suicidal ideation, caused by overload and emotional exhaustion. Among the analyzed sexes, the female is the one that suffers the most from this disease, women over 21 years old are targets of...
mental exhaustion, depersonalization and worsening of health. Regarding the period of college, even if their academic performance is satisfactory, there is a prevalence of SB among students from the 1st to the 10th period. A high relationship between the Syndrome and lack of sleep has been demonstrated, which causes damage to physical and psychological well-being. To make the situation even worse, many use unhealthy habits, such as the use of sedative and psychoactive drugs, as well as energy drinks to feel capable of performing their academic tasks.

In this sense, it is noted that medical students have a high probability of developing BS, due to high study hours, exhausting routine and feeling of helplessness, among other factors. Many of these academics have suicidal thoughts and emotional problems. In view of this, it is necessary to further study this theme in order to reduce or even end these sufferings.

**Keywords**: medical academics; burnout syndrome; public health.

### 1 INTRODUCTION

The word Burnout is said to be an English jargon, in which the individual does not present energy in its totality, was established in 1970, by Herbert Freudenberger, an American psychologist, responsible for characterizing the symptoms of professional burnout and conducting an extensive study on Burnout Syndrome (BS) (1,2).

With this, SB is configured as a set of feelings and sensations, such as emotional exhaustion, memory alteration, loneliness, depression, anger, tension, diminished empathy, excessive worry, sleep disturbances, headache, low back pain, and suicidal thoughts (1). It often occurs in professions that require direct contact with the population, especially in the health field (2,3).

This syndrome is described in the International Statistical Classification of Diseases and Health Problems, and is mentioned by the International Code of Diseases (ICD-11)(4).

SB is defined as a psychological syndrome, based on the social-psychological perspective, sustained by a tripod, in which there is first, the feeling of exhaustion of physical and emotional resources; second, emotional exhaustion; and third, the distanced reaction in relation to the people who must receive care - depersonalization - and, finally, the feelings of incompetence and loss of productivity, low personal accomplishment(5,6).

The Oldenburg Burnout Inventory (OLBI) and Copenhagen Burnout Inventory (CBI) analyze the psychic and behavioral instability to guide the diagnosis (7,8).

SB is diagnosed from the analysis of a tangle of "symptoms", the most used test is the *Maslach Burnout Inventory* (MBI), created in 1978 by Christina Maslach, which presents three essential pillars: "Emotional Exhaustion" (EE), "Depersonalization" (DP) and "Personal Accomplishment" (PA)(6).

Since the first one mentioned is characterized by the depletion of energy resources, depersonalization presents itself as a mental state that does not excel in affective dissimulation or even distance with feelings of indifference and, finally, low realization is due to the reduced level of self-knowledge of one's personal abilities in relation to the social environment (9).
Since this SB is common in health professionals, the incidence of cases has been increasing in the last years, among physicians and especially among medical students, due to the excess of tasks, high workload of studies, accumulation of functions, countless responsibilities, family detachment, among other factors, and this way, the symptoms mentioned above are present in this public(3).

A study done by the JAMA editorial, "Physicians' Suicides and the Reasons," in 1903, warned about the reasons for suicides among physicians in the United States. The study noted that suicide in the physician population far exceeded that of the general population. Furthermore, in a meta-analysis of 54 studies and 17,560 subjects, the prevalence of depressive symptoms in newly trained physicians entering residency was approximately 28.8% (CI = 25.3-32.5) (10).

Among medical students, the prevalence of suicidal ideation was 11.1% (CI 9.0- 13.7%) and the preponderance of depression and/or depressive symptoms was 27.2% (CI 24.7-29.9%). Stress and anxiety associated with the competitiveness of medical school may be a possible cause of suicidal thoughts and depressive/depression symptoms among the students in question(10).

In this sense, it can be noticed that medical students, especially those in the more advanced years, are more prone to develop Burnout when compared to students from other health areas, due to stressful study loads, limited time, feeling of helplessness, among other factors. Added to this, SB can have negative impacts on the work life of these future professionals, as these individuals can advance to cognitive deficits, damage their interpersonal and work relationships, in addition to impairing the possible future care of these professionals.

Thus, the present study aimed to: evaluate the prevalence of risk factors associated with Burnout Syndrome and its consequences in medical students regarding the period 2012-2022.

2 METHOD

This is an integrative literature review conducted between 2012 and 2022, by means of searches in the PubMed and Medline databases. The descriptors used according to DECS (Descriptors in Health Sciences) were: "medical students, "burnout syndrome, "public health". From this search were found 69 articles, later submitted to the selection criteria.

Inclusion criteria were: articles in Portuguese and English; published from 2012 to 2022 and that addressed the themes proposed for this research, studies of the type (correlative descriptive quantitative study, exploratory descriptive cross-sectional study, survey, systematic review and scoping review), available in full.

The exclusion criteria were: duplicate articles, articles available in abstract form, articles that did not directly address the studied proposal, and articles that did not meet the other inclusion criteria.

After the selection criteria, 20 articles remained, which were submitted to a thorough reading for data collection. The results were presented in tables and descriptively.
Through an exception, a study from 1903 was included, due to its high impact within the scientific community, JAMA journal.

</table>
Among the selected articles, most presented a survey as a design. This strategy, which is a type of quantitative research, can be defined as a way to collect data and information from characteristics and opinions of groups of individuals. The year 2012 to 2021, having lower and higher prevalence in research, respectively, being possible to analyze the content and interpret the information relating to each study.

Regarding gender, data indicate that women between 21 to 25 years old that had never failed academically, had harmful sleep habits with more than 30 hours of weekly studies that affected physical and psychological well-being, having low to moderate levels of Burnout syndrome, second, being, more evident in female students between, the third and fourth year of college (11,12).

Considering that, within the period described above, most students, of both genders, had grades at the required average, however, even so such students had high levels of personal demand, causing wear and tear and dissatisfaction, most used coping strategies as a form of "escape and avoidance", detachment and denial, used hypnotics (sedatives) to induce sleep, as well as made use of psychoactive and energy drinks, to stay awake. Reporting a lack of academic emotional support (2,13).

The prevalence of burnout is approximately 50% among students, who suffer from exhaustion and worsening of mental health, depersonalization, from entering college to graduating. Among the studies analyzed, there was a variation of 25 to 75%, which were associated with suicidal ideation, intention to drop out of the course, academic overload and emotional exhaustion (11,14).

However, it was observed that, according to Brazil is one of the countries with the highest rate of people affected by symptoms characteristic of the burnout syndrome, and that structural, occupational, environmental and sociocultural factors are intrinsically related. The incidence of the syndrome in China was similar to the Brazilian figures, since the articles showed a prevalence of loss of personality, lack of personal accomplishment and emotional exhaustion. In summary, the work reports that the quality of life in medical students is considered deficient, in a negative correlation between burnout and satisfaction, that is, high indices of the syndrome associated with low indices of physical and mental well-being.

4 DISCUSSION

According to the survey data raised in the result it is valid to highlight that there is an important association between the prevalence levels of Burnout Syndrome in medical students and the sleep dysfunctions of 7 out of 10 of them evaluated (5,15) primarily related to women (5,15).
SB may also be concomitantly associated with the lack of an academic emotional support network (16,17) and/or family (18) and culminates, in a recurrent manner, in suicidal ideation and intention to drop out of the course (2,12).

It is also important to add that 3 out of 10 of the students evaluated with indications of burnout used psychoactive substances, and 7 out of 10 habitually used energy drinks (19).

The present study, in order to verify the high rates of burnout among medical students, highlighted the main risk factors predisposing to the syndrome, since they are modifiable factors, namely: sleep deprivation and sleep disorders, as well as structural, occupational, environmental and sociocultural factors that are intrinsically correlated in Brazil (15,19).

Considering that the Brazilian country is one of the countries with the highest rates of people affected by symptoms characteristic of burnout syndrome, the clarification of this syndrome, its risk factors and the impacts that affect social, academic and professional life, are indispensable and necessary components for a better understanding and coping with the syndrome (14).

Among the results presented, it can be inferred that most students diagnosed with SB, as well as the presence of characteristic symptomatology, were women, in an age range over 21 years old, with satisfactory academic performance index or who had failed in some curricular subject (17).

The evaluated academics presented harmful sleep habits, which can affect physical and psychological well-being, in a way that facilitates burnout; with net hours of study exceeding 30 hours per week, which comprises more than 8 hours of study per day, not counting the hours of classes (4,20).

Thus, there is a correlation between SB in women with impaired mental health, associated with exhaustion intrinsic to academic life and with emphasis on the first and fifth years of the course, these being the periods of highest prevalence for burnout; no databases of scientific studies sufficiently capable of explaining the high prevalence of Burnout in female medical students were found (14,18).

It is possible to evaluate that, in general, SB is associated in more than half of the students who suffer from mental exhaustion and depersonalization, from the moment they enter college, being more prevalent among first and fifth year students, even if the grades were within the average admitted by the educational institution. The prevalence of burnout among medical students was associated with suicidal ideation in up to 7 students out of 10 assessed, as well as intention to drop out of the course, academic overload and emotional exhaustion (9,14,21).

5 CONCLUSION
The present study deals with the contributing pillars to SB, which are derived from the excessive curricular activities, as well as the psychic emotional wear of the respective public evaluated. In this sense, it allows emphasizing that there is a predominance of women in the early stages of college with an age range of 21 years old who find themselves with their psychic capacities in borderline, which generates short-term damage in their student development and later in their work area.
Moreover, it is noted in this public that the emotional disturbance generates a cascade of feelings and consequently harmful actions to the people around them. Many of them have suicidal ideations, irritability, sleep disorders, and different food preferences in order to relieve this extreme stress "(or feeling of invalidity)". It is necessary that this theme be further discussed in order to reduce mutual suffering and the suicide rate in the country's population, specifically among medical students.

Therefore, it is noted that the data evaluated in this work highlight the need to dialogue with other psychiatric illnesses and comorbidities that are in association in more detail in new studies on this theme so that the diagnosis is made in a timely manner willing to offer early treatment and reduce the damage caused by psychic emotional instability.

In summary, the paper reports that the quality of life in medical students is considered deficient, in a negative correlation between burnout and satisfaction, that is, high rates of the syndrome associated with low rates of physical and mental well-being.
